Dessert Oranges in Cucumber and Pine houses are ripening off better fruit than usual. The trees had a very sickly appearance after the fruit was set; probably the compost in which they were potted was not of that substantial character in which the Orange tree delights to grow. The following dressing was applied to the surface of the pots—viz., equal parts of guano, charcoal powder, and loam. The result was wonderful. In less than two weeks the pale green leaves became of the deepest healthy green; fresh healthy growths took the place of those of a stunted unhealthy character. A temperature of 65° at night is very suitable to the ripening fruit.

Cucumber House.—This is a very trying time for the occupants of this structure. The plants in our fruiting house died off in a

very unaccountable manner before the younger ones were ready to put out. As soon as possible all the old soil was removed, a fresh compost of turfy loam with a little rotted manure added to it was put into the bed, and the young plants turned out. With Tender and True and the original stock of Blue Gown a supply has been kept up every month in the year; but wishing to have the stock true, a succession of plants has been kept up from cuttings for a number of years. And even though the fruit is so long, and not so freely produced as that of the Sion House breed, we have not yet been driven to a plan practised by some gardeners, and that is to cut a specimen in half for one day, reserving the other portion for a future occasion. However, it is as well to know that this plan answers occasionally when Cucumbers are not plentiful.

PLANT STOVE AND ORCHID HOUSES.

We have not found it necessary, in order to maintain a suitable temperature, to use much artificial heat. The shading has also been removed from all the houses except the cool Orchid house, and no syringing overhead is practised; keeping a look-out for mealy bug, and destroying it on its first appearance. The different varieties of *Calanthe* are in full beauty at present—long handsome spikes of pure white, white with yellow and red-eyed, also the many different shades of colour from pale rose to deep red in the beautiful hybrid *C. Veitchii*. And how easily they are grown! Orchid peat and sphagnum moss are not at hand everywhere, and the greater proportion of *Orchids* cannot be grown without them. Not so the *Calanthe*. Turfy loam from any upland pasture, an eighth part of rotted manure, and a little silver sand added will grow them to perfection. Pot three bulbs in a 6-inch pot, draining them well, and taking care that the drainage is not choked by the particles of loose earth which adhere to the turf; a little sphagnum, or the rougher portion of the loam from which the loose earth has been shaken placed over it, will prevent this. We do not overwater the plants now, and when the flowers fade no more water will be given until the bulbs start into growth in February. *Poinsettia pulcherrima* is forming its floral bracts, and, the pots being packed quite full of active roots, a little weak manure water helps them greatly. *Bougainvillea glabra* has been removed from the stove to a greenhouse temperature. This plant requires scarcely any water during the winter months. The earliest plants of *Dendrobium nobile* are in full flower. The latest-flowering have just completed their growth, and have been removed from the stove to a cool house.—J. DOUGLAS.

TRADE CATALOGUES RECEIVED.

Kelway & Son, Langport, Somerset.—*Catalogue of Gladioli*.
J. Cocker & Sons, Sunnypark and Froghall Nurseries, Aberdeen.—*List of New Pansies*.

R. Cragg, Car Colston, Bingham, Notts.—*List of New Roses and Hardy Spring Bedding Plants*.

J. B. A. Deleuil, Traverse du Fada, Marseilles.—*Catalogue of Amaryllis, Begonia, Echeveria, Yucca, &c.*

Little & Ballantyne, Carlisle.—*Descriptive List of Fruits*.

F. & A. Dickson & Sons, 106, Eastgate Street, Chester.—*Catalogue of Forest and Ornamental Trees, Evergreens, &c.*

Frères Simon-Louis, Plantiers-à-Metz.—*Prix Courant et Nomenclature Générale des Variétés en multiplication, 1874-75, des Arbres, Arbustes, et Arbrisseaux Fruitières, d'Ornement, de Plein Air, et des Rosiers*.

C. Huber & Co., Hyères (Var).—*Catalogue Général pour l'Automne, 1874, et le Printemps, 1875. Cultures spéciales pour la production de Graines de Fleurs, d'Arbres et d'Arbustes d'Ornement, &c.*

Smith & Simons, 36 and 38, Howard, St. Enoch Square, Glasgow.—*Catalogue of Roses and Gladioli*.

TO CORRESPONDENTS.

* * All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

ENAMEL BEDDING (F. H.).—As you only name three kinds of plants for your beds that are 2 feet 6 inches wide, we conclude it is unnecessary to caution you against attempting too much in such narrow beds. The proportion which the plants should bear to each other depends entirely upon their position. For an outer row of Golden Feather Pyrethrum, along each side there should be two of *Alternanthera* next it, with a broad band of *Lobelia* entirely filling the centre; or one row of *Lobelia* against the Pyrethrum, with all the centre of *Alternanthera*.

LARCH CONES (B. B.).—Our correspondent will be obliged by being informed how best to extract the seeds from Larch cones.

SELECTION OF VINES (T. H.).—Additional Muscats may be Duchess of Buccleuch, Bowood Muscat, and Mrs. Pince's Black Muscat. For your Black Hamburgh vine you may have Black Frontignan, Black Prince, Black Champagne, and Royal Muscadine.

MUSHROOM CULTURE (W. Ferguson).—In our No. 68 there is a full detail of the culture. We know of no modern book devoted to the subject.

VERBAL AGREEMENT (Joplin Smith).—That has no legal protection for you. You had better state the case to the purchaser and make a compromise.

FUNGUS (X. Y. Z.).—The fungus is *Cantharellus aurantiacus*, the false Chanterelle, a near, but suspicious, ally of *C. cibarius*, the edible Chanterelle. We cannot name the other without seeing a specimen, but it may be a variety of the above.

DRIED FLOWERS FOR CHRISTMAS DECORATIONS (M. E. M.).—Any of the principal florists who advertise in our columns, and the florists in the Middle Avenue in Covent Garden Market, sell them.

FLOWER-BED ARRANGEMENTS (E. M. J.).—The proposed arrangement does not infringe the laws of colour, and it is well balanced, yet many of the combinations are harsh to say the least. We do not like the effect of the dark Iresine Lindeni with Bijou Geranium in 2, 3; exchange it for the Blue Lobelia in 4, 5, and make a broad edging of two rows of Lobelia around Bijou in 2, 3, so as to impart tone and softness to two such large beds, which otherwise might overpower the central bed, rendering it insignificant. This latter bed might be somewhat larger with advantage. Of the beds in the side panels, 10 and 11 are not good. We would substitute *Tagetes signata* pinnatifida (keeping its flowers picked-off) for the Perilla; 14 and 15 are quite inadmissible. We are really disposed to be severe with you; the combination is glaring—in the worst possible taste, and has not even the merit of novelty. Pray discard the Calceolaria, and substitute *Viola cornuta* Perfection for it; and in 16, 17, replace the Iresine with Lobelia Omen, or failing that, take the bright *Coleus Verschaffeltii* Improved. We possess no real substitute for the Golden Pyrethrum; try the Golden Stitchwort, *Stellaria graminea* aurea. *Polemoniumeruleum* variegatum forms a charming edging, and *Coprosma Baueriana* variegata is now deservedly popular; it has fine handsome foliage of deep green and rich yellow. Your bedding stock is somewhat antiquated. Miss Kingsbury Geranium is far superior to Bijou, and of other plants you should have *Santolina incana*, *Mesembryanthemum cordifolium* variegatum, the *Coprosma* and *Polemonium*, *Leucophyllum Brownii*, *Cineraria maritima* compacta, some of the Alternantheras, such as *amena* and *magifica*, with such Geraniums as Rev. F. F. Fenn, Florence Durand, Black Douglas, Creed's Seedling, and William Thompson.

WINTERING ECHEVERIAS IN A COLD FRAME (J. F. C.).—They would not winter in a cold frame unless you could with certainty exclude frost, and they are also liable to suffer from damp. They are best wintered in a house from which frost is excluded, and should be kept rather dry.

WINTERING DAHLIA ROOTS (Idem).—It is evident, from the roots having decayed, that they have been frozen before or after they were stored in the sand; we think the former. The crowns being near the surface are often damaged by a severe frost, and wet very often is a cause of the buds or eyes decaying. We should take them up after the first frost, and if they are not flowering we would remove them now, cutting off the tops at 6 inches from the ground; on taking up remove all the soil, and lay them upside down in a shed to dry. When dry, as they will be in a few days, place them crown upwards in sand, just so deeply as to cover the crowns, and in a place safe from frost. They would do well in a box in rather damp sand, not wet, on a shelf in the boiler-shed, the temperature not exceeding 45°.

HEATING CUCUMBER PIT (J. D.).—There is always a difficulty in flue-heating, and especially when it is employed as a means of affording bottom heat, in diffusing it equally throughout the house. The hot air chamber will help you on the side where the flue first passes along, but not at the other, which will need to be exposed for top heat, it being aided by the heated air of the other introduced to the house by the opening in the chambers. Another furnace can hardly be necessary for so small a house, and you will not need bottom heat on both sides, as a bed on one with the plants trained over the roof to the other will be ample. Your heating is wrong; the flue ought to be clear of the outside wall, and the three surfaces—two sides, and the top—would give you about one-third more heat from the same furnace, and probably all you require. The flue should also be clear of the ground. What do you think of heating by hot water? When a high temperature is required it is the preferable mode of heating.

BEGONIAS IN WINTER (Flora).—If of the bulbous section they will need to be kept dry like Gloxinias, and in a temperature of not less than 45°, potting and starting into growth early in March, and growing on in heat until they are coming into flower, and may then be removed to a greenhouse, assigning them the warmest part and lightest position. Many of the kinds are very beautiful. They are also suitable for warm positions outdoors, hardening well off before planting out.

PRUNING FIGS (Idem).—Prune them in April, cutting out the old bare branches destitute of young growths, which last should be retained and not shortened. As soon as the leaves have fallen, the trees ought to have the branches and shoots brought together, and be covered with mats to protect them from frost, removing it in April, or, if mild, earlier.

PROPAGATING VERRENAS (A Constant Reader).—It would not answer to take cuttings now, as they would not strike without bottom heat; but you may take up the plants, cutting them in rather closely and pot them, propagating from them in spring in a hotbed. The Show and Fancy Pelargonium cuttings ought to be potted singly, and when they are established should be cut back. The Rose cuttings "taken off at this time" should be in a north or sheltered shady border. Our "Florists' Flowers" contains the treatment of Pelargoniums, Verbenas, &c. It may be had by post from our office for 5d.

SEEDLING PLUM? (C. Marsden).—Your Plum is a valuable one on account of its excellent quality at so late a period of the year as this is. It has the appearance of a late Diamond, and may probably be the same as what is known in Yorkshire as the Ryedale Plum. It is worthy of an extended cultivation.

PEAR MALFORMED (J. Taylor).—Your Pear with an excess of calyx at its eye—in fact, an instance of morphology, in which the calyx has become a mass of leaves—is very curious, but such instances, more or less excessive, are continually occurring.

GRAPES FOR SPAN-ROOFED HOUSE (A Continental Reader).—Buckland

Sweetwater, Black Muscat of Alexandria, Madresfield Court, Mrs. Pince's Black Muscat, Alicante, Black Champion, Black Hamburgh, Black Monukka, Black Prince, Lady Downe's, Frankenthal, Tretham Black, West's St. Peter's, Canon Hall Muscat, Muscat of Alexandria, Foster's White Seedling, Dr. Hogg, Duke of Buccleuch, Gros Guillaume, Mill Hill Hamburgh. These embrace the best of the Grapes grown in English gardens for dessert and exhibition.

WHITE GRAPE FOR EARLY VINERY (A. A.).—If you have a preference for White Frontignan Grapes you cannot do better than plant Dr. Hogg, raised by Mr. Pearson, which is the finest of all of that class.

POTATOES.—"In reply to 'D. W. W.,' my experience of Sutton's Hundred-fold Fluke Potato is precisely similar to his. I have grown it two seasons with a like result; it is waxy and quite unfit for the table.—F. W., Hertford."

PEAR FOR S.W. WALL (J. Chapman).—Plant Glou Morceau. The path you mention will not injure the tree.

NAMES OF FRUITS (J. Green).—Soldat Esperen. (R. H. A.).—1, Catilla; 2, Triomphe de Jodoigne. (W. B. B.).—8, Scarlet Nonpareil; 9, Cox's Orange Pippin; 10, Marmalade Pippin; 16, Golden Winter Pearmain; 18, Wyken Pippin; 20, London Pippin. (Mrs. G. A.).—1, Scarlet Nonpareil; 8, Northern Greening; 4, Ord's. (E. Higgin).—Vicar of Winkfield. (C. cum J.).—59 and 110 Duchesse d'Angoulême; 164, 231, and 230, Vicar of Winkfield; 194, Bourré Langelier; 217, Van Mons Leon Leclerc; 192, Doyenne Gris; 216, Poire d'Amour; 180, Catilla; 60, Flemish Beauty. (G. Drea).—1, Glou Morceau; 2 and 3, Verulam; 4, Kirke's Lord Nelson.

NAMES OF PLANTS (Young Gardener).—All wretched specimens; 2, *Silene* sp.; 4, *Alternanthera* sp. Rest only leaves. (W. Welsh).—1, *Peperomia arifolia* var. *argyrea* (Bot. Mag., 5634); 2, *Eupatorium Weimannianum*; 3, *Begonia arystrochisma*; 4, *Ceropegia elegans*; 5, *Spirea callosa*. (G. N.).—1, *Alstroemeria* sp.; 2, *Disandra prostrata*. (A. B. C.).—1, *Bromus maximus* (?); 3, *Lromus* sp. (?); 2, *Eriophorum angustifolium*; 4, *Poa trivialis*; 5, *Aira* sp.; 6, *Panicum triviale*. (Name Misaid).—1, *Asplenium flabellifolium*; 2, *Adiantum farleyense*.

POULTRY, BEE, AND PIGEON CHRONICLE.

OXFORD POULTRY SHOW.

(From another Reporter.)

FEW, if any committees of poultry shows, can boast of so rapid an advance in public favour as the Managers of the Oxford Show. This year's aggregate entry was considerably over 1400 pens, and we can justly say that the majority of the birds were of unusual excellence. This can only be ascribed to the liberality of the prize schedule and the unvarying courtesy of everyone in connection with the Exhibition. There is, however, one feature that before another season comes round requires revision—viz., as a trial it was arranged (and a notice to that effect was actually printed on each label), that competitors must send in their birds before midday on the Tuesday, the Committee indulging the hope that the catalogue and general awards would be ready by opening-time the next day. It proved (as it invariably has done in the many cases in which the attempt has been made), a marked failure, for during the whole of the afternoon basket after basket arrived from the railway stations, as, in fact, was the case also in many instances during the following day. The publishing of the catalogue was therefore in no way expedited, whilst the Judges who awaited orders for some time, found soon after commencing their duties the shades of evening fast stealing in upon them, so that the greater portion of their awards had to be made with undue rapidity during the earlier part of the Wednesday forenoon to meet the opening to the public at 11 A.M. The wiser course with so good a Show is to arrange for the reception of the poultry to take place over evening, and then the Judges can without hindrance enjoy the whole of the following day in the fulfilment of their by-means-easy adjudications. As will be seen from the above, the best lights of both middays proved unavailable. We may add that both poultry and Pigeons were very carefully attended to, and the repacking was most expeditiously carried out; the railway officials worked also with a will to return the packages by the earliest available trains.

The competition in almost every instance was confined to chickens of the year. The *Dorking* classes were not of that general excellence that might have been fairly anticipated, more especially as Prince Leopold gave a silver cup for the best pen of Dorkings of any variety. It was won by a new exhibitor with a pen of Dark Greys, large in size, wonderfully perfect in legs and feet, and of good colour. A very fine pen or two were thrown out of competition by the extremely sooty colour of the feet, an inadmissible failing with Dorking fowls. One of otherwise the best pens in the lot (15), Mr. Gee's, contained a hen with a wry leg, and we regret to say, although entered as chickens (pen 11), Mr. Henry Lingwood's were unquestionably old birds, and consequently were disqualified. Silver-Greys, White, and Blue Dorkings were throughout of medium character. The *Spanish* were very fine, though many were not in first-rate order for the show-pen. The Spanish cup pen was extremely good, in admirable condition, and being entered at the ridiculously low figure of £3 12s., were speedily claimed amidst a host of competitors, the lucky purchaser having many willing offers of double the amount he had just paid for them. Another equally covetable bargain was the two-pounds *Spanish* cock in

the Selling class, for which we were told the new owner absolutely refused eleven sovereigns! In *Cochins* (Buff), the competition was excellent and a close run. The first-prize pen, though very young, were extraordinarily large and of good colour; the second-prize being a very highly conditioned pair, the pullet a gem, but the cockerel by far too high-coloured on the shoulder, slightly barred on the wing with a narrow line of white, and did not carry his wings as satisfactorily as he might have done. A few pullets of grand colour and shape were also shown, but mated with indifferent cockerels. The Partridge *Cochins* were in admirable feather, and comprised twenty-three pens, twelve of which appear in the list of awards. At the head was a grand pen of Mr. Tudman's, the cockerel being a perfect giant, with resplendent black breast and general plumage, whilst his companion pullet was one of those most accurately-marked gems so rarely seen now-a-days, but which were so admired by amateurs of some twenty years or more back. The third-prize pair, shown also by Mr. Tudman, were equally remarkable for *Cochin* type and the heavy leg-feather and fluff for which most Partridge *Cochin* breeders now seek in vain. It is scarcely to be wondered at that such superiority of Mr. Tudman's strain of Partridge-coloured *Cochins* should raise irritable feelings in the breasts of those who pride themselves in fruitless endeavours to despoil that gentleman's yard of its well-deserved notoriety. Both *Light* and *Dark Brahmas* were very large classes, among which were a number of most excellent chickens, but the order of the day seemed to be the selection of first-class pullets to inferior cockerels.

Game were throughout the finest classes yet seen this season, Brown Reds and Black Reds of either sex being general; and the Duckwing pullets deserve a special note as to their excellent quality. A protest for painting the wings of the cup Duckwing Game pullet was entered, but proved to be utterly groundless. This new kind of annoyance against successful exhibitors requires, as will be seen by what follows, a little careful investigation, and prior rules for its due administration, as being apt in the hands of the disappointed or the unprincipled to bring on alike unjustifiable expense and trouble to the managers of similar exhibitions. In Golden-spangled *Hamburg* cocks Mr. James Long took the silver cup with a very excellent bird, claimed by himself at a show about a month back at ten guineas. It appears that a notification reached a party at the Oxford Show, who was himself implicated some years back in a matter of the like character, that if this particular bird "won the cup" (pen 427), a protest was to be at once entered against it for being "trimmed" on the breast feathers. Fulfilling to the letter the instructions just named, the protest was presented, but properly refused by the Committee unless sent directly from the objectors. A telegram was received a few hours later complying with the demand of the Committee, and therefore was at once entertained, it being then getting late in the last afternoon of the Show being open. Mr. Edward Hewitt of Birmingham, as being the nearest available Judge, though not previously officiating in the classes for *Hamburgs* at the Oxford Show, was summoned by telegraph, and after the passage of not less than five telegrams, went direct at a moment's notice by the first available train. It proved Mr. Long's bird was unquestionably trimmed on the breast feathers, the white flecks at the tips being very artistically removed by scissors. In compliance with the usual regulation against trimming the cup was consequently withheld. But what now occurred seems to give the appearance that Mr. Long was rather sinned against than sinning, for that gentleman astutely suggested that the second-prize pen (428), shown by his accusers, Messrs. Duckworth, should be then subjected to the same ordeal, to which all unanimously agreed. The result was this cockerel proved far more thoroughly "trimmed" than the former one. Our readers will be best able to form their own conclusions as to who might have actually "trimmed" this fowl, the fact of the trimming of both being all that was entertained at the meeting.

Lovely varieties of *Waterfowls* formed a large class, and the entries of *East Indian Ducks* were extraordinarily good. *Turkeys*, the heaviest weighed 54½ lbs. net. The best pen of *Aylesbury Ducks* reached 17½ lbs. the pair.

(From a Correspondent.)

THERE has probably never been gathered together a finer collection of chickens than that which was to be seen at Oxford on October 28th and 29th; for though many classes at the Birmingham Summer Exhibition were filled with remarkable birds, still the average merit was not so uniformly high through all classes. The birds, of course, were not so matured, and there was not the same opportunity of viewing them well and judging them fairly. The Show appeared to us in every sense of the word a success, and the Committee deserve the highest praise for their untiring zeal and peculiar talent for organisation. The greater part of the poultry were shown in the Corn Exchange, a building beautifully lighted from above, and well ventilated. How strange it seemed to see rows of Mr. Billet's pens all over the

area, which we have seen cleared for the gorgeous masonic halls at Commemoration. The numbers were well arranged—no running up and down was necessary to find the separated halves of classes, as is so often the case, and still it was so managed that those varieties which peculiarly require a good light to be appreciated were advantageously placed. In a gallery at the end of the building were two rows in charming contrast, the one against the wall of *Silkie*, almost every pen beautifully shown, and in front of them *Black East Indian Ducks*, so placed that you could look through the pen from either side, and catch their lovely lustrous hues in the fullest light. The *Pigeons*, *Bantams*, and a few other classes were in the Town Hall, a good building for the purpose; and the court-yard between the two buildings was roofed in to form a spacious corridor, with *Geese*, *Ducks*, and *Turkeys* on either side.

The Oxford Committee are fortunate as well as able and energetic, for we know of no other show which is to such a degree patronised by all classes. The county families all drive in to see it, and send many representatives of their yards; the ancient University, too, by no means despises poultry-keeping as too rustic an amusement. At least three heads of colleges and the venerable archdeacon are fanciers, and might be seen carefully scrutinising the pens; the undergraduate element is not wanting either amongst exhibitors or visitors. The farmers of the neighbourhood take much interest in it, as is evident from the increasing number of local exhibitors. A poultry show really does good which draws farmers into the fancy; they have the best opportunities for rearing good birds, and by a little attention to the subject their stocks may be made really profitable. Lastly, the townspeople came in in crowds on the second evening. Why the inhabitants of Bristol, Cambridge, and other places will not do the same is a mystery.

To come to particulars, *Dorkings* headed the list very properly. (Why, by the way, should Birmingham, of all places in the world, go in for fashion, and displace this old English breed for the popular *Brahmas*?) Coloured birds numbered eighteen pens. Judges seem to think that champion cups must necessarily go to this variety. We could not admire the pair to which Prince Leopold's £5 cup was awarded. The cockerel was large but ungainly, and held his tail on one side; the pullet was lighter in colour than winners generally are now-a-days. Mr. White's second-prize pair were good all round, save that the cockerel's earlobe showed white. Mr. Burnell's third-prize pen contained a grand cockerel, lacking a trifle in sprightliness. Mr. Stratford's fourth-prize pen was unequally matched, the cockerel a good *Dorking* in shape, deep-breasted and full-tailed; the pullet poor and light in colour. Pen 8 (Taylor) had the advantage of a corner pen, but seemed to us worthy of more than a high commendation, the cockerel good in shape and comb, and with spurs well inside; 9 (Beachey) were large birds, but the pullet had bad claws and sooty feet; 11 (Lingwood) evidently contained an old cock (and we hear the Judge thought an old hen too), with spurs growing for the second time; 15 (Gee) were winners of the local prize, the hen had apparently once had a leg broken. On the whole this was not one of the best classes.

Silver-Greys (fourteen entries).—Here the standard seems going up rapidly; red in the wings of pullets is a rare failing now, and the cockerels were nearly all veritably black-breasted. The cup pen was faultless; their owner's highly commended pen contained the finer pullet, but not in such condition as the winner's. The second-prize cockerel was in our opinion far too yellow for a prize *Silver-Grey*. Third-prize pen contained a large and beautiful pullet; the cockerel too grizzly in thigh. Mr. Wren's fourth-prize birds were neat but small. Pen 19 (Cato) a well-coloured pullet, silvery, with real robin breast. Pen 21 (Rutledge) a fine pullet. The local exhibits in this class were a sad falling-off in quality from the two previous shows.

Cuckoos (seven entries) were on the whole a failure; the cup pen dark in colour, and of fair size. The second-prize pair were poor, the cockerel very light, and his hackles yellow. The best *Cuckoo* we saw in the Show was a cockerel of *Lady Dartmouth's* in the Selling class.

White (twelve entries).—The cockerels in this class struck us as being forwarder than the pullets, and superior to them. The growing tendency in *Dorkings* to spurs behind seems a special failing in the *White* variety. The cup pen large, and evidently still young; but the cockerel's comb is coarse, and when more developed will be to one side. The award of the second prize was incomprehensible; the birds are both yellow all over. Third-prize handsome cockerel, good in comb, though we preferred the same exhibitor's unnoticed pen (46) for the rare whiteness of the cockerel, the Birmingham cup bird. Pen 41 (*Pilgrim*), neat though small; 42 (*Robinson*) contained the largest pullet in the class, but with a bad comb; 50 (*Tearle*) very young and promising birds.

Spanish (seventeen entries) were not equal to many other classes; a first-prize *Spanish* cockerel in the Selling class was a remarkable bird, and with an equally good pullet would have been far before the winners in this class. The pullet in the cup pen was a beautiful bird, the cockerel smooth but not large in

face; they were priced at £3 12s., and were a bargain for somebody. The third-prize pen contained a splendid cockerel, with a wretched pullet. Pen 52 (Parker) looked very young, and merited a notice; pen 61 (Rodbard) a sprightly cockerel, most lustrous in colour.

Cochins.—The show of Cochins was excellent, many of the birds being marvels in size and development. Cinnamons and Buffs numbered nineteen pens. The first place was closely contested by Mr. Percival and Lady Gwydyr. The cup birds were of enormous size, the pullet deep buff and sound in colour. Lady Gwydyr's pullet was of an exquisite canary colour, the peculiar shade we remember having seen in some of the early-imported Cochins; unfortunately, from the illness of the cock, this pen was removed before we had a full view of them. 73 and 74 (Burnell) were good pens, the pullet in the latter very young. Partridge (twenty-three entries).—There could be no doubt about the award in this class, Mr. Tudman's pair were grand all round, the only fault which the most critical eye could discover would be in the leg-feathering of the cockerel. The cockerel in the second-prize pen was of enormous size and rich in colour, but underfeathered on the leg; the pullet's breast-pencilling very distinct. Mr. Tudman also carried off the third prize with a grouse-feathered pullet, and a cockerel perfect all round, though small.

Black Cochin fanciers have made most meritorious efforts to improve their breed and to bring it into notice, but we must confess that their efforts have up to the present time met with but partial success. Blacks mustered sixteen pens. The cup birds looked young, and should develop into something good; second apparently very young. They are excellent in colour, the cockerel especially so. Taken all round, we preferred Lady Gwydyr's pullet to the cup-winner. 114 (Goring) were about the largest pair, but the cockerel had the fatal colour in his neck-hackle.

Any other variety (or rather Whites, for no Cuckoo or bird of unwonted colour put in an appearance), were an admirable class of fourteen pens, on eight of which were cards. First, of course, was Mr. Woodgate with a pair before which critics must be silent, the pullet still young, and of marvellous frame; the second had but one fault—a little white in the cockerel's lobe; the third-prize cockerel was by no means equal in comb to his two superiors in the list. The local-prize pen contained a gigantic cockerel, though with a tendency to sickles, and not good in colour, and a fine and pure white pullet. Pen 130 (Burnell), a good pullet, but rather yellow.

Brahmas followed; and what work for judges and reporters! Thirty-four pens of Darks of the highest merit, and thirty-eight of Light. First came the Dark. We were very glad to see the cup won by Mrs. Baillie Hamilton, who has long so carefully and perseveringly bred Dark Brahmas. The cockerel is an immense bird, though browner on the wing than we like; the pullet also very large, but not very distinct in breast-pencilling. Mr. Ansell's second and fourth-prize cockerels were both grand birds, the pullet with the former most beautifully pencilled on the breast. Mr. Lingwood was only third, which speaks much for the excellence of the class. His pullet was hardly equal to his usual type, and we suppose pulled down her magnificent broad partner. The fourth-prize cockerel had white in the tail, and the pullet was by no means equal to the second. We admired two of Miss Douglas Pennant's pullets; but the gem of the class, in our opinion, was the pullet in pen 159 (Leno). She is of the Silver-Grey strain, perfectly pencilled all over, and has the most beautiful head. It was a pity that she was badly matched with a narrow cockerel.

In the class for Light Brahmas the best pen came first, Mr. Wakefield winning both first and second. His first-prize cockerel was a perfect bird in form and feather, with glossy black tail, the pullet being only excellent in neck-hackle. We should have mated the second pullet with the first cockerel. The third-prize cockerel was remarkable for extraordinary foot-feathering. The cockerel in the fourth pen was large, grand in shape, and well feathered, but very deficient in marking of neck-hackle. Pen 187 (Dean) very neat, but not up to such competition in size. We noticed many otherwise nice pullets spoilt by dark speckling on the back.

Game would have been a show by themselves—nearly two hundred pens in six classes. First on the list as winner of the cup for a Black Red cockerel comes Mr. Matthew; other exhibitors seem to have their day or year of success, but Mr. Matthew's triumphs are perennial. His cup bird was superb all round, distancing his thirty rivals, especially in the snake-like head. The second was an admirable bird, long and strong in limb. A local exhibitor, Miss Osborn, was deservedly third. Black Red pullets were thirty-one in number, as well as the cockerels. Major Newdegate was first with a most elegant bird, which we observed was claimed at £8 8s. Brown Reds mustered twenty-four cockerels and thirty-seven pullets. We thought these the best of the Game classes. Here again Mr. Matthew was first in pullets, his winner matchless in form and condition. In the classes for Any other variety were shown nineteen

cockerels and twenty-four pullets. The quality in these classes did not strike us as being so good as in the others, especially so in that for cockerels; of these the cup and second-prize birds were Duckwings, the third a rich Pile. In the pullets, the cup and third prize went to Duckwings, the second to a rich stylish Pile.

Hamburghs.—The five varieties each had their three-guinea cup, and a goodly collection they were. We much regret the artificial embellishments to which this breed is subject, and which in the case of the combs of the Pencilled cocks seem almost necessary to success. Many careful breeders and true fanciers do not show for this reason, but while judges connive at it and give prizes to cocks with combs carved after a uniform model, what can be expected? We purposely abstain from mentioning particular instances of this trimming, as the offenders are many and have much encouragement.

In Golden-pencilled (twenty-nine entries), the cup went to a pair, the cock of which was very rich in colour but deficient in growth of sickles. The second and third-prize pens also contained beautifully-shaped cockerels. Pen 401 (Long), perfect in points must have been thrown-out for want of condition. The local prize went to a poor pair, the ground colour of the pullet being of two shades. The cup for Silver-pencilled (fourteen entries), went to a faultless pair; the cockerel's comb might, perhaps, have been prettier, but it was refreshing to see one in the form in which Nature constructed it. The second-prize pair lacked the style of the first, though the cockerel's sickles were handsomer; third would have been higher had the pullet's neck-hackle only been clearer. Pen 419 (Long), had a very neat cockerel.

Golden-spangled (twelve entries).—We regret to record that the cup for this variety after having been (to first sight deservedly), given to a perfect pen, was subsequently, in consequence of a protest, withheld by the Judge from it on account of the cockerel's breast having had the trimmer's scissors carefully and artistically applied round each feather. In justice to the owner it must be said that he asserted that he had but lately claimed the bird and that from the very person who protested against the award, and that it had not been tampered with in his possession. The cockerel in the second-prize pen was coarse in comb.

In Silver-spangled (fifteen entries), the cup pen contained a pullet which was perfection in spangling, the cockerel devoid of spangle at the end of one sickle—a decided blemish. The cockerel in the second-prize pen was not entirely free from red in earlobes. The third cockerel was too wide in comb, and had a faint suspicion of colour on the wing, but his sickles were exquisite. The cup for the local exhibitor of the best pen of Hamburghs went to a pair in this class.

Black Hamburghs (sixteen entries), were pretty as usual. We were rather surprised to see cards on nine out of the sixteen pens. Mr. Serjeantson's cup birds were very neat in comb and good in colour. The very highly commended pen struck us as equal to the second and third birds. Pen 465 (Leake) were fortunate to obtain high commendation, being somewhat red in earlobes.

Polands were divided into two classes—viz., Black with White Crests, and Any other variety. Five pens alone appeared in each class, and in the Black class two of these were too late for competition. Mr. Darby was first, his pullet an exquisite bird; and we do not think this award would have been altered if Mr. Unsworth's birds had been in time, for though one of his cockerels was in tuft the best bird in the class, he was wry-tailed. The second-prize pair would undoubtedly have succumbed to the late arrivals, for the pullet had a poor tuft, flat behind. In the class for Any other variety Mr. Adkins carried off all the prizes with Silvers. A rich-coloured pair of Golden (Fearnley), were unnoticed, and must, we think, have arrived too late.

Houdans seem in popularity to distance too far their French cousins. They filled forty-two pens, and the Judges showed their approval of the class by noticing twenty-two of them and by giving an extra prize. In the earlier numbers of the class light colour prevailed, such as one saw on the birds first imported. The first-prize cockerel was a noble bird, a thorough French Houdan with good crest; the pullet by herself must have given way to others. We preferred Mr. Wood's third-prize pen to his second. They were good all round, while the second-prize pullet had a Polish look, her crest being very light and her general colour dark. Miss Neville's pen, to which an extra third was awarded, contained a grand pullet, the cockerel, however, rather narrow. Mr. Dring's highly commended pair were fine birds, almost too dark in colour. 491 and 493 (Quibell) were perfection of colour; 497 (Fowler) contained a very big cockerel but bow-legged.

Any other variety *French* (fourteen entries) resolved itself into a class for Crêves, for not a single pen of La Flèche or any other kind appeared. First and second were marvellous pairs, probably the finest Crêve chickens ever seen. If we must criticise, the first cockerel had a few white feathers in his crest, but no good judge could pass over such birds for such a trifling defect.

We should have preferred both pens with shorter legs; a Crève cock used to be shown by Mr. Siebel, which we always admired as the perfect type of Crève for his shortness of leg. Mr. Dring was third with birds which would a short time ago have carried all before them.

Malays (seventeen entries) put in a most creditable appearance. The cup pair were immense in limb and good in colour; the cockerel in the second-prize pen would have looked better without a featherless spot on his crop; third were Whites, if such we can call them, for the cockerel had red on the wing and the pullet brown on the breast. We were very glad to see Whites, and suppose that the Judge awarded them a third prize to encourage fanciers of the variety; we should have given third to pen 545 (Bradford).

American Fowls (seventeen entries), are emerging from the Variety class, and had a class to themselves. The White variety of Leghorn seems superior to the Brown. Mr. R. Fowler won the cup with a White pair; the cock had a very gamey look. We cannot admire the sickly yellow tinge of these birds' earlobes, very like that of a carp's scales, but suppose it is a necessary accompaniment of yellow legs. Second were Plymouth Rocks, the cock somewhat scaly in feet; third, White Leghorn again. Two nice pens were disqualified from the owner having evidently through inadvertence left their home marks on their legs.

White Silkies were probably the best collection of this variety ever seen. How the standard has improved since the Oxford Committee two years ago liberally gave them their first class, and how have exhibitors improved in getting them up! Mr. Woodgate, of course, took the cup in this class as well as for White Cochins. The second-prize birds were very white but lighter in earlobe than we like. The third hardly merited their position. Pen 569 (Watts) contained a four-clawed hen, which the Judge must have overlooked in giving them a high commendation.

Any Other Breed (ten entries).—From the multitude of classes few were left for the Variety class. First were a lovely pair of White Minorcas in blooming condition. How pretty are their white legs and faces after the Leghorns! Second Sultans; third a good pen of Cuckoo Dampies, the pullet, however, far too long in leg. Black Minorcas and White Guinea fowls were highly commended.

Bantams had six classes. For Black Reds there were thirty-one entries. The awards seemed unexceptional, and the highly commended pens were all worthy of prizes. Brown Reds only matured thirteen pairs; the winners were all good and well shown. The chief feature of the class for Any other variety Game was the large number of Piles which appeared, many of them of great beauty. The cup went to a perfect pair, second and third being given to Duckwings. The class for Black Clean-legged Bantams was excellent. The cockerel in the cup pen reminded us rather too much of the Hamburgs' combs aforementioned. Twenty-one pairs in all were shown.

In *Sebrights* (seven entries), Mr. Leno, strange to say, was not first. Mr. Braund's first-prize birds were Golden, very regular in lacing, and good in colour. Mr. Leno's second were Silvers, particularly clear in ground colour. In the class for Any other variety of Bantams, Japanese were first, the cock a beautiful bird, white with a magnificent black tail; they were soon claimed at their modest price, three guineas. Pekins were second, and White Clean-legged third. We should prefer seeing the latter variety compete with Blacks, their points, barring colour, being all the same.

Ducks.—Mr. Fowler carried off all three prizes in Aylesburys with such birds as only Aylesbury can produce. Twenty-two pens of Rouens competed. The cup pen were easily first, and of great merit. All three prizes for Black East Indians went to one exhibitor, and deservedly too; they were wonders in colour, condition, and closeness of feather. The old exhibitors are all left behind by Mr. Sainsbury. By the liberality of a lady a class was provided for Call Ducks; nine pens appeared, all Whites. We wish other people would follow the example of this lady. One hears too much now of "paying" classes, and many lovely breeds have become neglected from being always relegated to the hazard of Variety classes. We should not have liked to judge this class, so little apparent difference was there in the birds. It was to be regretted that none of the Coloured variety were shown—those lovely miniature Mallards.

Turkeys were fine, but struck us as looking cramped even in their large pens, and many had broken tails.

In *Geese* Mr. Fowler again carried off the cup with a gigantic pair of Embden. Truly Mr. Fowler's Geese are all Swans, though not in the ordinary sense of that phrase. His Toulouse second were almost equally grand. The third-prize pair came from Blenheim. It would be impossible to criticise the awards in the Selling classes of 220 pens; they were on the whole of extraordinary excellence, and the bargains were many, of which fanciers seemed to avail themselves as never before at Oxford.

If this report of the poultry is somewhat lengthy, our apology must be that it is not easy to do justice to a thousand and odd pens of such birds in any cursory remarks. We seem to have

entered upon a new era of poultry-showing. Each variety is bred up to such excellence that few exhibitors can safely indulge in more than one or two, and the day seems quite past in which any one person can sweep the board as formerly did Mrs. Arbuthnot and others in a dozen breeds.

PIGEONS.

Carriers had five classes. First in the catalogue came Mr. Fulton, and first in the prize list too, with a Dun cock perfect in condition and points. Mr. Yardley was second with a Black, and Mr. Fulton again third with a Black less in wattle than his first-prize bird, but evidently younger. The prizes in this class (for Black or Dun cocks) were all well placed. Pen 1021, very highly commended, contained a good Dun; and Col. Hassard's highly-commended bird, though small in wattle, was magnificent in form. In the class for hens Mr. Yardley's first-prize bird had, for a hen, marvellous wattle. In the classes for Any other colour we specially noticed the first and third hens (Mr. Hammock's) for their extraordinary length; they were Blue. The class for young birds was the best in the Pigeon Show. There were twenty-nine entries, and the Judges must have had much trouble in making their awards. First was a dark Dun, second a Black, third a Dun, and extra third a splendid Blue.

Pouters had but two classes—viz., for cocks and hens of any colour. In cocks Mr. Bullen was first with a beautiful White, which we observed was claimed at £10. Mr. Fulton was second and third with respectively a Blue and a Yellow, both of which were much admired. In hens a White again was first, and justly so; a very good Yellow third.

Barbs were shown in pairs. In the class for old birds a small and good pair of Blacks were first, Blacks also second, and Reds third—grand birds, but the cock apparently rather antique. The class for young birds did not contain many or remarkable specimens.

Tumblers had three classes. The Almond class mustered better than usual—viz., nine pairs, many of them old friends and good. The production of Almonds seems too much of a science to extend itself in the fancy. In the Any variety Short-faced class good Black Kites were first, Agates second (we feared two cocks), Red Mottles third. In the Long-faced class Mr. Mapplebeck was first with well-marked Red Mottles, second were Black Balde, and third Feather-footed Reds.

Dragoons seem fashionable at present. The class for Red or Yellow was marked by the Judges "very good." That for Any other colour contained thirty-five entries. The first, Silvers, were a striking pair, to all appearance two cocks; second were Whites, and third Blues.

In *Antwerps* the first pair were excellent, Red Chequers second, and third Silver Duns.

Runts were obliged to be divided, cock and hen in each entry being in separate pens. Mr. Green's well-known Blue birds were first, judged, we believe, by weight.

Owls were properly divided into English and Foreign. The English class, though large, struck us as not being very good. First and third were Silvers, second Blue. Mr. Edge had a nice pen of Whites very highly commended, and Mr. Fulton a curious pair of Mottled Yellows highly commended. In the Foreign class first and second were White; pen 1281, highly commended (Wylie), a pretty pair of Whites with blue tails.

Nuns seem to have more admirers theoretically than practically. We suspect this is owing to the gross trimming to which at one time they were subjected, but which we are glad to see is falling into disuse. Seven pens appeared. The winners of first and third prizes were black-headed, those of second red-headed and very good.

Turbits had two classes to themselves, and excellent they were. The breed seems to be popular and bred up to a high standard. The first class was for Red or Yellow. First and second were Yellows, and of nearly equal merit; the first were most clean in thigh, the second brighter in colour; third were Reds with fine heads. The pair of Yellows very highly commended (Cresswell), though paler in colour than the winning Yellows, had magnificent frills. The class for Any other colour was marked by the Judges as "very good." First were beautiful Blacks, very rich in colour; second well-known Silvers, the hen far too brown to please us; third neat Blues; very highly commended another good pair of Blacks; pen 1303 (Smythe) nice shell-crested Blues. As shell-crested birds always compete to disadvantage with peak-headed, why should not others follow the example of the Newcastle Committee and give them a class?

Fantails were an excellent class, but we regretted to see them all of the large English type. The winners were all Whites. A curious blue-shouldered pair received more than their deserts in a commendation.

Jacobins were a large class. Mr. Fulton's first Reds were wonderful in hood. A non-fancier would hardly believe that Nature provided them with so artistic an ornament. Second were somewhat coarse Yellows, third Reds. Why an exquisite pair of Whites (Mr. Baker's) did not win, was to us a mystery.

Trumpeters become fewer and fewer. Alas! for the lovely

Whites which were shown a few years ago, and which seem to have almost become extinct since the importation of Russians. Will not some show be adventurous and divide Trumpeters into Russian and English? There were but five entries. First were Blacks far ahead; second Mottles, good in rose but deficient in foot-feathering; third Mottles, or rather Splashed Whites, good in everything but colour.

Maggies, as usual at Oxford, mustered well. The first and second were Blacks, and beautifully defined was their marking; third were Yellows.

The Any other variety class was not a large one. First were gorgeous Archangels, which threw their neighbours, a nice pen (1375, R. Woods), into the shade; second were good Red Frill-backs; third Scandaroons, gaunt-looking creatures. The Selling class contained but one good pen, a pair of White foreign Owls, which took first prize, and were soon snapped-up.

THE FIRST-PRIZE DORKINGS.—Having heard from two different parties that certain persons said the cockerel was hump-backed, wry-tailed, &c., I, on getting to Oxford the second time, again took this bird out of the pen and failed to find anything the matter with it except that it was evidently not as well as when I left it after judging; in fact, just before I left on Wednesday midday. It was with regret I saw that now its comb was sadly disfigured, and certainly was considerably bruised on both sides, as though wrenched on the head. Of course I cannot say how this occurred, but I never saw a case like it before.—EDWARD HEWITT.

NEWCASTLE-UPON-TYNE POULTRY SHOW.

We have been favoured by two correspondents with the following reports:—

In Class I, *Cochins*, Any colour, cockerel and pullet, first came a beautiful pair of Buff; second a grand pair of Partridge. The whole class was very good. In *Brahmas*, Any colour, cockerel and pullet, were several very beautiful pullets, but not one good cockerel. Messrs. Ainsdell's and Hon. Mrs. Baillie Hamilton's pens were empty. *Dorking* chickens, Any colour—the first-and-cup pair was the best we have seen this season; the second good, but young, very large, and not made up. The prize pens were both Dark-coloured. A very grand pair of Silver-Greys and one of Whites were very highly commended. In *Spanish* chickens the winners were far ahead of the others; the second-prize birds grand in quality, but younger than the first. *Polish* were old and young together; the first were well-known Gold, the second Silver; a very good pair of Golden chicks were very highly commended. All the *Hamborough* classes were remarkably good, the cup going to a splendid pair of Silver-spangled. *Game*, Any colour, over a year old, with the exception of the first Brown Reds and the second-prize which were Black Reds, were not good. In *Game* chickens the cup went to Brown Reds; the second prize to neat Black Reds. The class was a very good one.

Game Bantams were, as we expected, worth a long journey to see, the neighbourhood being celebrated for them. Black or Brown Reds over a year old had twenty-two entries, with scarcely an inferior pair in the class. The prizes went to Black Reds. Cockerel and pullet, Black or Brown Reds, twenty-five entries, were a splendid lot. The cockerel in the cup pen is a gem; the second-prize pair were also grand in style. In the *Game Bantams* other than Reds, over a year, the first were a beautifully coloured pair of Duckwings, the second Piles. The class was good throughout. *Game Bantams* other than Reds, cockerel and pullet—first a grand pair of Piles, second Duckwings of first-rate quality. A grand pair of Piles were in this class very highly commended. The whole class was good. For *Bantams* other than *Game*, the first were Silver-laced, the second Blacks.

The *Aylesbury Ducks* had only three entries, all of them good. The next class was a mistake, all the varieties except *Aylesbury* being shown together. The prizes went to most excellent *Rouens*; two good pairs of *Mandarins* and one of *Rouens* being very highly commended.

In the class for Any other variety of poultry the first were good Black *Hamboroughs*, the second *Houdans*. The poultry were in splendid condition, were fed on Spratt's food, and well attended to by an obliging Secretary and Committee.

PIGEONS.—As hitherto the great feature of the Exhibition was, the Pigeon department, the entries numbering 691 pens.

In the *Pouter* classes the cup went to a splendid Blue cock in perfect condition, in a keen competition. Blues also took all the prizes in the classes for Blue or Black. In those for Red or Yellow cocks, a fine Yellow was first and Red second; while in the class for hens a rather gay but very showy Red was first, and a capital Yellow second. Several other good Yellows competed. In *Pouter* cocks, Any other colour, the first prize was taken by a very fine lengthy White, a grand Mealy being second. In the class for hens both prizes were awarded to good Whites.

In *Black Carriers* Mesars. Yardley and Fulton took the prizes with good birds. In *Carriers*, Any other colour, Mr. Fulton was also successful with magnificent Duns; the sectional cup going to this exhibitor's first-prize cock. In the young *Carrier* class both prizes went to very promising Duns.

Dragoons, Blue or Silver, were numerous, but not particularly strong in quality. The first and cup were awarded to a stylish Blue, a good Silver second. In *Dragoons*, Red or Yellow, an even lot competed; the first a good Yellow, Red second. In *Dragoons*, Any other colour, a splendid Grizzle was first, and White second.

For *Short-faced Tumblers*, Almonds, the prizes went to first-class birds, well shown, several pens receiving notices. In *Short-faced Tumblers*, Any other variety, cocks, an exquisite Kite was first, and Black Mottle second. In hens the same colours took the prizes in the order named.

In *Barb* cocks the first and sectional cup was given to an excellent Dun; Black second. In hens a good Black was first, and Yellow second.

Foreign Owls were scarcely so good as we expected. In the class for Any other colour except Blue or Silver, a good White was first, and a nice sound-coloured Black second.

In *Mottled Trumpeters* Mr. Lederer took first and sectional cup, with a bird capital in points, though slightly deficient in mottling. Splendid Blacks, all of the Russian type, took the prizes in the other class.

In *Fantails*, White, the first prize was awarded to an extraordinarily good bird in a strong class. For Any other colour a good Blue was first, Black second.

In *Jacobins*, Red or Yellow, Red took both positions, the first going to a very small Red, which also had the sectional cup. The class for Blacks also contained good birds. In *Jacobins*, Any other colour, a beautiful White was first.

Turbits were large classes, but do not require particular notice. *English Owls* were well represented, the first and sectional cup was awarded to a Blue of great merit in every respect; a capital Silver taking second. The class contained many other good birds, the foreign cross being now exhibited much less than formerly.

Maggies and *Nuns* were ordinary classes.

In *Short-faced Antwerps* Mr. Gamon had the first and cup with a wonderful Red Dapple. The second was a good Silver Dun. In *Long-faced* both prizes went to good Red Dapples.

Long-faced Tumblers had three classes, which were well filled with good specimens.

In Any other variety the first was a Black Turbitten; second a Damascus.

COCHINS.—*Chickens*.—1 and *vhe*, G. H. Procter, Durham. 2, J. Leeming, Broomfield. *hc*, G. U. Foreman, Gosforth; C. Turner, Worton; D. & J. Ibbotson, Wharby; T. M. Derry, Gedney; J. Batey, jun., Hexham. *c*, G. Pounder, Kirby Moorside.

BRAHMA POOTRAS.—*Chickens*.—1, J. Hardman, Bacup. 2 and *c*, C. Venables, Durham. *hc*, C. Venables; J. Watts; M. S. Temple, Hexham; Lady A. B. Peirse, Bedale.

DORKINGS.—*Chickens*.—1 and *cup*, C. Widdas, Howden-le-Wear. 2, G. Pounder, *hc*, J. Stephenson, Chapelhall; W. Moritt, Goole. *hc*, G. Parker; J. White, J. Robinson, Garstang.

SPANISH.—*Chickens*.—1 and *cup*, H. Beldon, Bingley. 2, J. Leeming, *hc*, C. A. Kay; J. Thresh, Brailford; J. Gliddon, Bristol.

POLISH.—1 and 2, H. Beldon. *hc*, T. Dean, Keighley. *hc*, J. Fearnley, Newton-le-Willows; P. Unsworth, Loxton.

HAMBOROUGH.—*Golden-spangled.*—*Chickens*.—1, G. & J. Duckworth, Church. 2, J. Robinson. *hc*, J. Roberts, Burton Holmes; J. Crawford, H. Beldon.

Silver-spangled.—*Chickens*.—1, 2 and *cup*, H. Beldon. *hc*, J. Roberts, Ashton at Booth; Mottram; J. Walker, Ripley; J. Robinson, *c*, G. Stalker, Bedlington.

HAMBOROUGH.—*Golden-pencilled.*—*Chickens*.—1, G. & J. Duckworth, 2, H. Beldon. *hc*, Ashton & Booth; G. & J. Duckworth; W. Clayton; T. W. Fawcett; H. Beldon. *c*, W. Dixon, Derby. *Silver-pencilled.*—*Chickens*.—1, H. Beldon. 2, J. Louf, *hc*, J. Robinson; H. Beldon.

GAME.—1, G. C. Wilson, Malmthorpe. 2, J. Harrell, Sunderland. *hc*, Miss M. J. Nelson, Hexham. *Chickens*.—1 and *cup*, W. Higgin, Ulverston. 2, H. Beldon. *hc*, W. Omerod, Todmorden; Miss M. J. Nelson; J. A. Mather, Close Green; J. Pattison, Beside Colliery; J. Stark, Morpeth; Master J. Midlemis, Seaton Delaval. *c*, Miss M. J. Nelson.

GAME BANTAMS.—*Black or Brown Reds*.—1, W. F. Addie. 2, J. Barlow, Monkwearmouth. *hc*, Miss M. J. Nelson (2); G. Bell; J. W. Brookbank, Carforth. *c*, D. Hunter, Sunderland. *Chickens*.—1 and *cup*, W. F. Addie. 2, J. Ferry, Cowpen. *hc*, J. Barlow; W. Rogers, Sunderland; G. Downe, Bedlington; J. Short, Bedlington; W. Murray. *c*, Miss M. J. Nelson; W. & H. Adams, Bedale.

ANY OTHER BANTAMS.—*Any other colour.*—1, Miss M. J. Nelson. 2, W. Gray, To & Law. *hc*, J. Burnop, Lintz Green. *c*, W. Murray; R. Sanders, Newcastle. *Chickens*.—1, Mrs. J. Dye, Hexham. 2, Miss M. J. Nelson. *hc*, W. Rogers; R. Brownlie, Kirkcaldy. *hc*, J. Burnop; Miss M. J. Nelson; W. Gray; J. W. Brookbank; P. Unsworth. *c*, J. Louf.

BANTAMS.—*Any other variety except Game.*—1, H. Beldon. 2, T. P. Carver, Boroughbridge. *hc*, Miss M. J. Nelson; W. Canney, Bishop Auckland; J. Mayo, Gloucester.

ANY OTHER VARIETY EXCEPT TURBENS AND GEES.—*Pair*.—1, H. Beldon. 2, H. Beldon. *hc*, Miss M. J. Nelson; J. Wilkinson, Bedlington Colliery; W. Robson, Deptford.

DUCKS.—*Aylesbury.*—1, W. Stonehouse, Whithy. 2, T. P. Carver. *c*, W. Canney. *Any other variety.*—1, W. Swann, Bedlington. 2, Miss M. J. Nelson. *hc*, J. Jackson, Carnforth; W. Canney; R. Johnson, Sunderland. *hc*, W. Canney; R. Johnson; F. B. Fenwick, North Shields. *c*, G. Cartmel, Kendal.

ANY OTHER VARIETY EXCEPT TURBENS AND GEES.—*Pair*.—1, H. Beldon. 2, H. A. Cave, *hc*, Miss G. B. Elliott, Newcastle. *hc*, J. Louf; Stott & Booth, Bury; J. S. Routh, Chesterfield; S. P. Brook, Reigate. *c*, E. Symons, Hebburn New Town.

SELLING CLASS.—*Price not to exceed 40s. per Pair.*—1, A. Widdas, Darlington. 2, J. Hardman. *hc*, G. Pounder; J. Walker; T. P. Carver; G. H. Procter; H. Beldon. *c*, J. A. Brook, Holmthorpe.

SELLING CLASS.—*Price not to exceed 30s. per Pair.*—1, A. Widdas. 2, J. Paterson. *hc*, S. H. Lloyd, Maghull; Hedley & Ridley, Hexham; H. Beldon. *c*, M. Graham, Bedale.

PIGEONS.

POUTERS.—*Blue or Black.*—Cocks.—1 and Cup, H. Pratt, Birmingham. 2, H. Simpson, Crumlington. *hc.* R. W. Bryce, Edinburgh (2); H. Simpson; R. Fulton, London; Ridley & Dye, Hexham; E. Beckwith, Sunderland. *Hens.*—1, J. Baker, London. 2, H. Simpson. *hc.* R. W. Bryce; R. Fulton; Ridley & Dye (2).

POUTERS.—*Red or Yellow.*—Cocks.—1, Ridley & Dye. 2, R. W. Bryce. *hc.* N. Hill, Edinburg; R. Fulton; Ridley & Dye. *Hens.*—1, R. Fulton; E. Beckwith. *Hens.*—1, R. Blacklock, Sunderland. 2, H. Pratt. *hc.* R. Fulton. *hc.* Ridley & Dye; G. Robinson, Sunderland; E. Beckwith.

POUTERS.—*Any other colour.*—Cocks.—1, R. Fulton. 2, Ridley & Dye. *hc.* H. Pratt; Mrs. Ladd, Calne; Ridley & Dye; E. Beckwith. *Hens.*—1, Ridley & Dye. 2, R. Fulton. *hc.* H. Pratt; Mrs. Ladd; R. Fulton; Ridley & Dye.

CARRIERS.—*Black.*—Cocks.—1, H. Yardley, Birmingham. 2, R. Fulton. *hc.* R. Fulton; E. Beckwith; P. R. Spencer, Hereford. *Hens.*—1 and *hc.* R. Fulton. 2, H. Yardley. *hc.* W. Sefton.

CARRIERS.—*Any other colour.*—Cocks.—1, 2, and Cup, R. Fulton. *hc.* E. Beckwith. *Hens.*—1 and 2, R. Fulton. *hc.* W. Sefton. *hc.* A. Beckwith; A. Bilyeald, Nottingham; W. Sefton.

CARRIERS.—*Young Cock or Hen.*—1, R. Fulton. 2, W. Bulmer, Spalding. *hc.* R. Fulton; A. Bilyeald; A. N. Dodds, North Shields; W. Sefton (2).

DRACONS.—*Blue or Silver.*—Cock or Hen.—1 and Cup, W. Smith, Walton. 2 and *hc.* F. Graham, Birkenhead. *hc.* H. Yardley; R. Fulton (2); W. Sefton. *c.* R. W. Richardson, Beverley.

DRACONS.—*Red or Yellow.*—Cock or Hen.—1, W. Sefton. 2, F. Graham. *hc.* R. W. Richardson; A. Jackson, Bolton-le-Moors; F. Graham; W. Sefton.

DRACONS.—*White, or any other colour.*—Cock or Hen.—1 and 2, F. Graham. *hc.* G. Hardy, London; G. D. Pickersgill, Lippin; W. Sefton. *c.* A. Jackson; R. Robson, Chester-le-Street.

TUMBLERS.—*Short-faced Almond.*—Cocks.—1, Cup, and *hc.* R. Fulton. 2, E. Beckwith. *hc.* H. Yardley; Miss A. M. Anderson, Newcastle; J. Stephenson, Gateshead; E. Beckwith. *Hens.*—1 and 2, R. Fulton. *hc.* J. Baker.

TUMBLERS.—*Short-faced, any other colour.*—Cocks.—1, J. Baker. 2, R. Fulton. *hc.* R. Fulton; E. Beckwith (2). *Hens.*—1, 2, and *c.* E. Beckwith. *hc.* R. Fulton; J. Baker.

TUMBLERS.—*Almond, or any other colour.*—Cock or Hen.—1 and 2, E. Beckwith. *hc.* R. Fulton.

TUMBLERS.—*Cocks.*—1, 2, and Cup, R. Fulton. *hc.* J. Baker. *hc.* E. Beckwith (2). *c.* W. Brydone, Dunae. *Hens.*—1 and 2, R. Fulton. *hc.* H. Yardley. *c.* W. Brydone.

OWLS.—*Foreign, Blue or Silver.*—Cock or Hen.—1, T. Rule, Durham. 2, R. Fulton. *Foreign, White or any other colour.*—Cock or Hen.—1, G. Alderson, West Hartlepool. 2, W. Brydone. *hc.* R. W. Bryce; W. Brydone.

OWLS.—*English.*—Cock or Hen.—1 and Cup, J. Gardner, Preston. 2, A. N. Dodds. *hc.* J. Watts; Ward & Rhodes, Ouley. *hc.* T. W. Clemenson, Hexham (2); E. Walker; T. Charnley, Blackburn.

TURBATS.—*White.*—Cock or Hen.—1 and Cup, J. Lederer, Liverpool. 2, R. Fulton. *hc.* J. Lederer. *Any other colour.*—Cock or Hen.—1 and 2, R. Fulton. *hc.* C. A. Van der Meersch.

FANTAILS.—*White.*—Cock or Hen.—1, E. Beckwith. 2, J. F. Loversidge, Newark. *hc.* Miss A. M. Anderson, Newcastle; J. F. Loversidge; J. Walker; A. Smith, Broughty Ferry (2). *Any other colour.*—Cock or Hen.—1, H. Yardley. 2, Q. Blum, Manchester. *hc.* H. C. Bowman, Manchester. *c.* J. Kemp.

TURBATS.—*Red or Yellow.*—Cock or Hen.—1 and Cup, T. Rule. 2, R. Fulton. *hc.* R. W. Bryce; G. Hardy; R. Fulton; W. Brydone; T. W. Swallow, Northampton; J. Thompson, Bingley. *Black.*—Cock or Hen.—1, R. Fulton. 2, T. Rule. *hc.* R. W. Bryce; R. Fulton; J. Baker. *Any other colour.*—Cock or Hen.—1, W. B. Van Haasbergen. 2, T. Rule. *hc.* G. Hardy; T. Rule; A. A. Vander Meersch, London (2).

TURBATS.—*Red or Yellow, Point-headed.*—Cock or Hen.—1, T. Gallon, Gateshead. 2, T. S. Stephenson, Beverley. *hc.* T. Foster, Bingley. *hc.* A. & W. H. Storer, Sheffield; R. Fulton; J. G. Orr, Reith; C. Anton, Petergate, York. *Any other colour.*—Cock or Hen.—1, G. Hardy. 2 and *c.* M. S. Temple, Hexham. *hc.* Miss A. M. Anderson; R. W. Richardson; J. Baker; R. Robson. *c.* M. S. Temple.

TURBATS.—*Bed or Yellow, Shell-crowned.*—Cock or Hen.—1 and 2, T. Gallon. *hc.* W. Moore, Pickering; T. Foster. *Any other colour.*—Shell-crowned.—1, Ridley & Dye. 2, G. Hardy. *hc.* M. Green, Hexham.

MACPIES.—*Red or Yellow.*—Cock or Hen.—1, P. Wilson, Morpeth. 2, J. B. Bowdon, Blackburn. *hc.* T. Gallon; J. Thompson. *Black, or any other colour.*—Cock or Hen.—1, J. B. Bowdon. 2, R. Fulton. *c.* P. Wilson.

NUNS.—*Cock or Hen.*—1 and 2, A. A. Vander Meersch. *hc.* J. Young, Bishop Auckland. *hc.* R. W. Richardson; J. B. Bowdon; W. B. Van Haasbergen.

ANTWERPS.—*Short-faced, any colour.*—Cock or Hen.—1 and Cup, W. Gamon, Chester. 2, J. Gardner. *hc.* H. Yardley; J. Wright, Manchester (2); T. Jubb. *Long-faced, any colour.*—Cock or Hen.—1, R. J. Smith, Yarm-on-Tees. 2, T. H. Stretch, Ormskirk. *hc.* A. N. Dodds; J. Robertson, Thornton; Ridley & Dye.

TUMBLERS.—*Long-faced Almonds.*—Cock or Hen.—1, T. Mitcheson, Swallowfield. 2, Ridley & Dye. *hc.* E. Beckwith; Guthrie & Hope; J. Buchanan, Newcastle; M. Green. *c.* Kinghorn, Gateshead. *Long-faced Buds.*—Cock or Hen.—1 and 2, A. Jackson. *hc.* J. Watts. *c.* W. J. Donkin, Newcastle; G. D. Pickersgill. *Long-faced Beards.*—Cock or Hen.—1, Ridley & Dye. 2, J. G. Thompson, Newcastle. *hc.* R. Fulton; Ridley & Dye (2); A. Jackson. *c.* E. Beckwith.

ANY OTHER VARIETY.—Cock or Hen.—1, R. Fulton. 2, H. Yardley. *hc.* H. W. Lower, Sydenham. *hc.* A. & W. H. Silvester. *c.* M. Ord, Seelgheld.

SELLING CLASS.—Cock or Hen.—1, Mrs. Ladd. 2, W. H. A. Miller, Walsend. 3, J. Jones. *hc.* A. Hogg, Newcastle; J. Baker; J. Robshaw; G. B. Pickersgill. *c.* E. Beckwith (2). *Pair.*—1, C. Anton. 2, S. Lawson, Preston. 3, W. Brydone. *hc.* Guthrie & Hope, Hexham; E. Beckwith. *c.* A. Hogg.

CANARIES.
BELGIANS.—*Yellow or Yellow-marked.*—1, Medal, and 2, J. Rutter, Sunderland. *hc.* W. Scott, Willington Quay; J. Rutter. *c.* T. Harrison, Darlington. *Buff or Buff-marked.*—1, 2, and *hc.* J. Rutter. *c.* W. Scott.

NORWICH.—*Yellow.*—1 and 2, G. Sarge, Sunderland. *hc.* J. Allison, Long Benham; C. Robson, Burradon. *Buff.*—1, G. Sarge. 2, Cleminson & Ellerton. *Darlington.* *hc.* J. Spence, South Shields. *hc.* C. Robson. *Yellow or Buff-marked.*—1 and Medal, T. Cleminson. 2, T. Harrison. *c.* J. Soulsby, Cuxlode.

CRESTED.—*Yellow or Yellow-marked.*—1, Cleminson & Ellerton. 2, R. E. Triffitt, York. *Buff or Buff-marked.*—1, F. Knaggs, Newcastle. 2, J. Baxter, Newcastle. *hc.* J. Hurrell, Sunderland. *hc.* R. E. Triffitt; J. Hurrell; J. Baxter. *c.* T. Cleminson, Darlington.

GLASSBORO DRESS.—*Yellow.*—1, Medal, and 2, W. Clark, Newcastle. *hc.* T. Blackburn, Newcastle. *hc.* J. Murray. *Buff.*—1, W. Clark. 2, H. Frazer, Newcastle. *hc.* F. Campbell. *White.*—1, K. Gillespie, Blaydon. *Yellow or Buff-marked.*—1, W. Clark. 2, H. Frazer. *hc.* J. Davison, Newcastle. *hc.* Brown and Hackworth, Newcastle; T. Blackburn. *c.* P. Campbell; F. Ayre, Newcastle.

LIZARDS.—*Gold or Silver-spangled.*—1, Cleminson & Ellerton. 2, J. T. Harrison.

GREEN VINCH MULES.—*Yellow or Buff, nearest to Canary.*—1, J. Purdy, Ashington Colliery. 2, R. Laws. *Yellow or Buff-marked.*—1, J. Baxter. 2, J. Soulsby. *hc.* J. Baxter.

CINNAMON.—*Yellow or Yellow-marked.*—1, Cleminson & Ellerton. 2, J. Spence. *hc.* R. E. Triffitt. *hc.* J. Gillespie, Newcastle; J. Thackeray, Bradford; M. Dana, South Shields; J. Rutter. *c.* C. Robson; J. T. Harrison. *Buff or Buff-marked.*—1, T. Harrison, Willington Quay. 2, J. Rutter. *hc.* J. Gillespie. *c.* W. C. Burmiston, Middlesborough.

GREEN CANARY.—1, A. Ross. 2, H. Armstrong. *hc.* J. Allison; A. A. Ross, Newcastle; F. Duison, Newcastle. *hc.* H. Armstrong, Newcastle. *c.* M. Spours, Newcastle.

COMMON CANARY.—1, Brown & Hackworth. 2, J. Thackrey. *c.* J. Thackrey; J. Murray.

GOLDFINCH.—*Moulted.*—1, W. & C. Burmiston. 2, G. Stephenson, Gateshead. *c.* W. Bishop, Gateshead.

BROWN LINNET.—*Moulted.*—1, J. Baxter. 2, G. Stephenson. *hc.* J. Maddison, Hexham.

BURTON BIRDS.—*Any other variety.*—1, R. Pearson. 2, J. T. Harrison. *hc.* J. S. Stark, Newcastle; W. & C. Burmiston; R. Neil, Hewick.

FOREIGN BIRDS.—1 and Medal, A. J. Dancy, Gateshead. 2, W. Maxwell, Newcastle. *hc.* T. Mitford, Newcastle; J. S. Stark; W. Luley, Newcastle (2); E. Price, Newcastle. *c.* E. Price; R. A. Wood, Gateshead.

SELLING CLASS.—1, J. Spence. 2, Fleming & Stanhope, North Shields.

JUDGES.—*Poultry.* Mr. R. Teebay, Preston, Lancashire. *Pigeons.* Mr. P. H. Jones, Fulham, London; Mr. T. J. Charlton, Bradford. *Canaries.* Mr. W. A. Blakston, Sunderland.

BLAIRGOWRIE POULTRY SHOW.

THIS was held on the 4th and 5th inst., when the following awards were made:—

GAME.—1 and Cup, T. W. Mitchell, Perth. 2, R. Stewart, Blairadam. 3, W. Stewart, Forfar.

DORRINGS.—1, Cup, and 2, Mrs. G. Armitstead, Inchmartine. 3, G. Cuthill, Meigle.

SPANISH.—1 and Cup, J. Mackie, Lorny. 2, R. Orr, Stirling. 3, R. Barr, Falkirk.

ABRAMA POUTERS.—1 and Cup, W. Weir, Larbert. 2, D. Gellatly, Meigle. 3, J. B. Cochran, Stenhousemuir.

CORINUS.—1 and Cup, J. Wyse, Falkirk. 2, J. Drinnan, Woodhall, by Airdrie. 3, W. Smith, Newpoult-Tay.

HAMBURGERS.—1, A. Pratt, Kirkcaldy. 2, J. Ireland, Tayport. 3, J. Borland, Foldil, Kilbarchan.

BANTAMS.—1 and 3, J. Seton. 2, J. Patterson, Monifieth.

ANY OTHER VARIETY.—1, J. Sandeman, Dundee (Creeve-Creurs). 2, J. Smart, Carnoustie (Creeve-Creurs). 3, W. Mitchell, Balgonie (Houdan).

SCOTCH-GHEYS.—1, J. Aitken, Bathgate. 2, J. Young, Slateford, Edinburgh. 3, J. Crawford, West Cambus.

DORRINGS.—1, J. Fowles, Tayport. 2 and 3, A. Mackie, Lochie.

GOSLINGS.—1, J. D. Fell, Blairgowrie. 2, Mrs. Anderson, St. Fink, Alyth. 3, J. Leslie, Winton, Blairgowrie.

TURKEYS.—1, Mrs. Stewart.

SELLING CLASS.—1, G. Cuthill. 2, J. Sandeman. 3, D. Gellatly.

LOCAL CLASSES.

GAME.—1, A. Robertson, Blairgowrie. 2, A. Stephen, Blairgowrie.

DORRINGS.—1, D. Smith, Alyth. 2, J. D. Fell.

SPANISH.—1, C. Robertson, Almonet. 2, J. Mackie.

BIRMA OR COCHIN.—1, W. B. Hill, Coral Bank. 2, W. Borrough, Blairgowrie.

HAMBURGERS.—1, F. Thomson, Kettie. 2, W. W. McIntosh, Blairgowrie.

BANTAMS.—1, C. Clark, Ferneth. 2, J. Grant, Blairgowrie.

PIGEONS.

POUTERS.—1, T. Mullions, Perth. 2, Miss C. McNeil, Coupar Angus.

FANTAILS.—1, A. Smith, Broughty Ferry. 2, Miss C. McNeil.

ANY OTHER VARIETY.—1, A. Smith (Carriers). 2, D. Kenoedy, Forfar (Almond Tumblers).

NORWICH AND EAST ANGLIAN BIRD SHOW.

The following are the awards made at the Norwich Show, held on the 6th, 7th, and 9th inst.:—

NORWICH.—*Clear Yellow.*—1 and 2, J. Adams, Coventry. 3, G. & J. Mackley, Norwich. 4, Provart & Willis, Norwich. *hc.* G. & J. Mackley; J. Adams, *hc.* G. & J. Mackley (2); A. Palmer, Norwich; A. Hersuch & Son, Coventry; G. & J. Mackley (2); J. Adams; J. Athersuch & Son; Provart & Willis. *hc.* G. & J. Mackley; Provart & Willis. *c.* G. Gilmore, Norwich; J. Athersuch and Son; W. Minns.

NORWICH.—*Evenly-marked Yellow.*—1, 2, and 3, G. & J. Mackley. 4, J. Adams. *hc.* G. & J. Mackley. *hc.* G. & J. Mackley; J. Athersuch & Son; Provart & Willis. *hc.* G. & J. Mackley; Athersuch & Son. 4, G. & J. Mackley (4). *Ticked and Unevenly-marked Buff.*—1, Hampton & Chamberlin, Leicester. 2, A. Athersuch & Son. 4, G. & J. Mackley. *hc.* G. & J. Mackley; J. Adams. *hc.* G. & J. Mackley.

NORWICH.—*Ticked and Unevenly-marked Yellow.*—1, 2, and 4, J. Adams. 3, Athersuch & Son. *hc.* G. & J. Mackley; Athersuch & Son; Provart & Willis. *hc.* G. & J. Mackley; Athersuch & Son. 4, G. & J. Mackley (4). *Ticked and Unevenly-marked Buff.*—1, 2, and 3, J. Adams. 4, G. & J. Mackley. *hc.* G. & J. Mackley; A. Palmer; J. Adams; Provart & Willis. *hc.* G. & J. Mackley. *c.* Hampton & Chamberlin; G. & J. Mackley.

NORWICH.—*Marked Crested Yellow.*—1, F. Alden, Norwich. 2, J. Selby, Nottingham. 3, S. Stratford, Northampton. 4, G. & J. Mackley. *hc.* W. B. Howell. *Marked Crested Buff.*—1, 2, and 4, G. & J. Mackley. 4, F. Alden. *hc.* F. Alden; R. Hawman, Middlesborough. *hc.* G. & J. Mackley (2); Athersuch & Son; J. Goode, Leicester. *c.* S. Stratford.

NORWICH.—*Yellow, with Dark Crest.*—1 and 2, G. & J. Mackley. 3, G. Cox, Norwich. 4, F. Alden. *Buff, with Dark Crest.*—1 and 2, G. & J. Mackley. 3, R. Brown, Norwich. 4, W. B. Howell. *hc.* G. & J. Mackley; W. B. Howell; G. Cox. *hc.* G. & J. Mackley. *c.* F. Alden; Provart & Willis.

NORWICH.—*Yellow, with Clear or Grey Crest.*—1, 2, and 4, G. & J. Mackley. 3, J. Goode. *hc.* F. Alden; Hampton & Chamberlin; G. Cox; J. Selby.

BELGIANS.—*Clear and Ticked Yellow.*—1, Fawcett & Anderson, Baildon. 2, and 3, G. E. Russell, Brierley Hill. 4, J. N. Harrison, Belper. *Clear and Ticked Buff.*—1, G. & J. Mackley. 2, R. Sargent. 3, J. N. Harrison. 4, G. E. Russell.

LIZARD.—*Golden-spangled.*—1 and 2, R. Ritchie, Darlington. 3, J. N. Harrison. 4, J. Mackley. *hc.* Rev. V. Ward, Hythe. *hc.* G. & J. Mackley; Athersuch & Son; W. Evans. *Silver-spangled.*—1 and 2, R. Ritchie. 3, J. Hickton, Sutton-in-Ashfield. 4, J. N. Harrison. *hc.* W. Evans; W. Richards, Bwlwell, Notts. *c.* Rev V Ward (3).

LIZARD.—*Gold or Silver-spangled, with Broken Cap.*—1 and 3, R. Ritchie. 2, J. N. Harrison. 4, J. Hickton. *hc.* E. Jarrett, Lynn. *c.* W. Evans, Lower Broughton; Rev V Ward (3).

YORKSHIRE.—*Clear Yellow.*—1, J. Wilkinson, Great Horton. 2 and 3, G. and J. Mackley. 4, Knight & Spencer, Arisey. *hc.* Fawcett & Anderson; L. Belk, Dewsbury; H. Waring, Bradford. *Clear Buff.*—1, 2, and 3, J. Mackley. 2, L. Belk. 3, Fawcett & Anderson. 4, Rev T. C. Hoss, Roydon Rectory. *hc.* W. Carnick, Middlesborough; H. Waring (2); Knight & Spencer. *c.* J. Thackrey, Bradford.

YORKSHIRE.—*Variegated Yellow.*—1, L. Belk. 2, W. & C. Barniston. 3 and *hc.* J. Thackrey. 4, W. Carnick. *hc.* J. Wilkinson. *Variegated Buff.*—1, J. Thackrey. 2, R. Hawman. 3, J. Wilkinson. 4, G. & J. Mackley. *hc.* G. & J. Mackley; J. Thackrey.

MANCHESTER CORP.—*Clear Yellow.*—1, Withheld. 2, J. Shackleton, Wellfield, Rochdale. 3, J. Meakin. 4, J. Wilkinson. *hc.* G. & J. Mackley. *Clear Buff.*—1, Fawcett & Anderson. 2, G. & J. Mackley. 3, J. Meakin, Manchester. 4, L. Belk. *hc.* J. Shackleton; J. Meakin.

MANCHESTER PLAIN HEADS.—*Clear Yellow.*—1, Withheld. 2, J. Meakin. 3, J.

Shackleton. 4, L. Belk. *vhc*, W. Evans. *Clear Buff*.—1, J. Shackleton. 2, J. Meakin. 3, L. Belk. 4, Fawcett & Anderton. *hc*, Fawcett & Anderton; J. Meakin.

CINNAMON.—*Yellow*.—1, 2, 3, and 4, J. Adams. *vhc*, J. Athersuch & Son; R. Poole, Maldon. *hc*, B. Broadwater, Norwich; R. Poole. *Buff*.—1, 2, 3, and 4, J. Adams. *vhc*, B. Broadwater; Miss A. Poole, Maldon; R. Poole.

CINNAMON.—*Variegated Yellow*.—1, T. Tenniswood, North Aclam. 2, L. Belk. 3, W. & C. Burniston. 4, G. & J. Mackley. *Variegated Buff*.—*vhc*, J. Athersuch & Son. *hc*, J. Wilkinson; W. & C. Burniston, Middlesbrough. C. G. and J. Mackley (3).

ANY OTHER VARIETY.—1 and *vhc*, G. & J. Mackley. 2, T. Mann (Jonque London Fancy). 3, W. Hutton, Baldon (Grey Crest Cops). 4, J. Meakin (Ticked Plain Head Manchester).

GOLDFINCH AND CANARY MOLE.—*Variegated Yellow*.—1, R. Hawman. 2, J. Goode. 3, W. & C. Burniston. *vhc*, G. & J. Mackley; W. Hutton; J. Stevens. *Variegated Buff*.—1, Hampton & Chamberlin. 2, R. Hawman. 3, J. Stevens. 4, T. Tenniswood; R. Poole. *Dark*.—1, J. Wilkinson. 2, J. Athersuch & Son. 3, G. & J. Mackley. *vhc*, R. Hawman. *hc*, W. Carrick; T. Tenniswood; W. & C. Burniston; Hampton & Chamberlin.

LINNET MOLE.—1 and 3, I. Spence. 2, J. Stevens. *vhc*, W. Hutton (2). MOLE.—*Any other variety*.—1, W. Hutton (Bullfinch and Goldfinch Mole). 2, R. Hawman (Greenfinch and Canary Mole). 3, T. Tenniswood (Greenfinch Mole).

SIX NORWICH CANARIES.—*Irrespective of colour*.—1, 2, and 3, G. & J. Mackley. *vhc*, G. Gilmore; Provart & Willis. *hc*, Hampton & Chamberlin; R. Poole; H. Wright.

SIX NORWICH CANARIES.—*To Members only of the Norwich Bird-breeding Association (except the Alliance)*.—1, W. Drake, Norwich. 2, W. B. Howell. 3, A. Frost, Norwich. *vhc*.—Andrews, Upper Heigham; G. Aldham, Norwich; H. Warren, Norwich. *hc*, W. Hutehin, Heigham; A. Frost. *c*, F. Rant; J. Wilsea, Norwich; H. Warren.

SIX NORWICH CANARIES.—*To Members only of the Norwich Bird-breeding Association*.—1, B. Broadwater, Trowse Newton. 2, W. Raby, Norwich. 3, R. Noller, Norwich. *vhc*, R. Bartram, Old Walsingham; R. Smith, Norwich; E. Howard, Norwich; G. Sayer, Norwich.

MISCELLANEOUS.—*vhc*, A. Boatwright, Bangay (six Mules).

BRITISH BIRDS.

BULLFINCH.—1, G. & J. Mackley. 2, Knight & Spencer.

GOLDFINCH.—1, A. Boatwright. 2, W. & C. Burniston. *hc*, Provart & Willis; Knight & Spencer (2). *c*, J. G. B. Baker, Fressingfield.

LINNET.—1, Mrs. S. Royall, Norwich. 2 and *hc*, W. Carrick. *vhc*, G. & J. Mackley. *c*, T. Tenniswood.

REDPOLE OR SISLIN.—1 and 2, G. & J. Mackley.

SKYLARK.—1, W. Walter, Winchester. 2, T. Knight. *hc*, G. & J. Mackley.

BLACKBIRD.—1, G. & J. Mackley. 2, J. Battershill, Well Street, London Docks.

SONG THRUSH.—1, Mrs. C. Watson, Norwich. 2, G. & J. Mackley.

STARLING.—1, G. & J. Mackley. 2, J. Drake.

MAGPIE.—Prize, G. & J. Mackley.

JACKDAW.—1 and 2, G. & J. Mackley.

ANY OTHER VARIETY.—1, G. & J. Mackley. 2, W. Carrick.

BIRDS OF PASSAGE AND MIGRATORY BIRDS.

BLACKCAP.—Prize, E. Martin, London.

WHITETHROAT, OR ANY SPECIES OF WARBLER.—Prize, O. A. Watts, Brixton.

FOREIGN BIRDS.

CARDINAL.—*Red-headed*.—Prize, Miss E. A. Eeles, Southwold.

WAXBILLS.—*Any variety*.—Prize, W. Walter.

SPARROWS.—*Java*.—Prize, G. & J. Mackley. *Coral-necked*.—Prize, W. Walter.

PARAKEETS.—*Australian Grass*.—Prize, A. Ward, Norwich.

LOVE BIRDS.—Prize, T. Hookins. *hc*, Miss E. A. Eeles.

COCKATEALS.—Prize, G. & J. Mackley. *hc*, W. Walter; Rev. T. C. Hose.

PARROTS AND PARAKEETS.—*Any other variety of small*.—Prize, G. & J. Mackley.

PARAKEETS.—*Australian or Brou-tailed*.—Prize, Miss E. A. Eeles. *vhc*, W. Walter; Miss E. A. Eeles.

PARAKEETS.—*Ring-necked or Indian*.—Prize, Miss H. Engall, Norwich. *vhc*, G. & J. Mackley; J. Finch, Norwich; S. Empson, Norwich; Mrs. S. Royall; C. Coleman, Heigham.

PARROTS.—*Kuy*.—Prize, Miss Bateman, Heigham Grove. *vhc*, E. Jarrett; J. Drake; Rev. T. C. Hose.

PARROTS.—*Green, or any other variety of large*.—1, W. Walter.

PARROTS.—*Grey*.—1, J. Yallop, Cossey. 2, G. & J. Mackley. 3, J. Wyer, Norwich. *c*, W. Fitch, Norwich; C. Watson, Norwich; T. Loombe, Norwich; G. Pyle.

COCKATOOS.—*Any variety*.—1, M. George, Cable Street, London Docks (Lemon-crested). 2, G. Evans (White). 3, W. Walter (Rose-breasted).

FOREIGN BIRDS.—*Any other variety*.—Prize, Rev. T. C. Hose (Paradise Parakeet). *vhc*, Rev. T. C. Hose (Blossom Head); Miss E. A. Eeles (Orange Bishop).

SOUTH DURHAM AND NORTH YORKSHIRE FAT STOCK AND POULTRY SHOW.—The schedule of prizes issued by this Society is a most attractive one. Altogether it contains 117 classes. For poultry the prizes are, first £2, second £1; and Pigeons and Rabbits have £1 first, and 10s. second. The Show is to be held at Darlington on December 16th and 17th, and the entries close on Monday, November 23rd.

BOYLE'S PATENT SELF-ACTING HEAT REGULATOR.

This machine (*fig. 119*) is so constructed that when once set to any degree of heat within the limits of 40° and 200° Fahrenheit, it will maintain the same for any length of time without variation. It is adapted to the control of hot-water pipes in hothouses, or any other place; to the opening and shutting of stove-dampers; and, in fact, to any use which requires a simple up-and-down motion in connection with heat. Among other special uses are those of incubators, plant cases, Mushroom-beds, &c. In these cases the use of the Self-acting Heat Regulator will be at once allowed by all who have had experience of the annoyance, anxiety, and failure of the attempt to regulate heat.

The prospectus says that the Regulator will be found to act perfectly untouched for an indefinite time, and there will be no perceptible variation in the heat. The heat for an incubator is 106°, and it is impossible, the inventor states, that this heat can ever be exceeded if his Regulator is used. The hen does not impart 106° to the egg. The egg will always be found, if broken under a thermometer, to be 104°, and the under side of the egg

will be considerably cooler than the upper; and experience shows that at 106° constant heat (the heat of the hen) the eggs will die either before or on chipping the shell, while at 108° constant heat they die at once. These data are given from many experiments with the patent regulator incubator. It has been observed that nests made under the hedges, or in any wild situation, produce more and stronger chickens than those cared for in baskets or boxes. Under the former circumstances the under side of the egg must be much colder than the upper side. And this agrees with the inventor's experience, who finds that in eggs kept in a steady temperature, equal on all sides, the chickens usually die on the nineteenth or twentieth day, and if any struggle out they are very feeble. In the incubator it will be seen that this natural irregularity of heat is carefully imitated. Heating the egg from beneath—a plan often tried because of its great facility—is directly subversive of the natural conditions. The receptacle for the eggs in this incubator (*fig. 120*) imitates all the conditions essential.

Fig. 119.—Boyle's Heat Regulator.

- | | |
|-----------------------|---|
| A, Front of box. | L, Compensating springs. |
| B, Steel lever. | M, Supply pipe. |
| C, Connecting pipe. | N, Guard. |
| D, India-rubber pipe. | O, Connecting thread. |
| E, Glass U-tube. | P, Connection with gas supply. |
| F, Bowl of mercury. | Q, India-rubber connection with flame. |
| G, Elastic joint. | R, Gas lamp. |
| H, Balance weight. | S, Tap for letting water out of the jacket. |
| I, Pivot gas-tap. | |
| J, Stop-tap (gas). | |

The next point for consideration in imitating Nature is the daily cooling of the eggs for about twenty minutes, rather more than less, when the hen leaves to feed. This must by no means be omitted, and we do not think that eggs suffer from a great deal of cooling (so that they get the full proper heat between times); but they soon die under half measures, such as many hours at 100° or 90°. If the eggs be never cooled most of them will die between the fifteenth and twentieth day, and all farmers' wives are aware that a "hard sitter" does not produce a certain brood.

The next thing to imitate is the natural damping of the eggs by the ground, the air, and slightly by the perspiration of the hen. This must be attended to, for if it be attempted to hatch the eggs without any moisture the chickens will in most cases be found to hatch without absorbing the yolk-bag, or, having partially absorbed it, will, on moving about, again extrude the bag and perish. On the other hand, with too much moisture, the eggs will addle. Daily sponging of the eggs is generally recommended, but the inventor prefers a gentle natural vapour.

Finally, as the hen kicks her eggs about regularly on return-

ing every day to the nest, it must be for the benefit of the chicken, and therefore it should be imitated. When the chickens chip the egg, the hen sits lightly, and lets the little prisoners extricate themselves, if they are, as they ought to be, strong enough. She never, as it has been asserted, attempts to help them. Moreover, her instincts no doubt tell her, that if a chicken cannot escape, it is not strong enough to live when assisted. In this incubator a chamber is provided in which the egg is placed when chipped, or immediately before chipping, and the chicken then comes out in freedom.

The hen covers the chickens for some weeks under her breast and wings. To imitate this most essential comfort two "mothers" are provided, heated by the cistern, and the chickens are placed under them as soon as dry. The mothers must be supplied with cotton wool or flannel for the chickens to nestle in, and with the warmth against their backs they are quite contented.

Fig. 120.—BOYLE'S INCUBATOR.

This incubator holds thirty eggs at a sitting, or three chickens every two days; but it can be made to hold double or treble if specially ordered.

DERBY ORNITHOLOGICAL SOCIETY'S SHOW.

The seventeenth annual Show of Cage Birds, and the second of poultry, Pigeons, and Rabbits, was held in the magnificent Rifle Drill Hall on the 7th and 9th inst. This is one of the best halls in the kingdom, and certainly is surpassed by none for such a purpose; as it is well lighted from the top the specimens were very easy of inspection. Through some mistake or other, most of the pens had to be taken down at a time when the birds should have been penned, and in consequence the arbitrations could not be commenced till it was nearly noon on the first day, and the visitors having been admitted the judging was carried out under the greatest difficulty; but in every other respect the management was exemplary, the birds being well attended to, fed, and watered.

The entries for poultry were very large considering the number of classes, and it was a matter of surprise to us to find so many good pens. *Cochins* came first, and these were a very good class, the medal for the heavy varieties being awarded to a very good pen of Buffs. The second were White, well-shaped, good, and clear, but not large. *Brahmas*, Dark, were fair; the first good all round, sound in colour, but the pullet not well pencilled. The second prize pullet was superior in that respect, but the pen losing in general quality. In *Light Brahmas* were some good birds, but some were a little overshadowed and yellow. The first were grand in shape, colour, and marking; the cock's comb

spring a little too much, and the hen rather scanty on feet-feather; the second a little better in feet-feather, and the cock's comb but somewhat yellow and cloudy. Many other pens came very close for the prizes.

Game were next, but in *Black-breasted Reds* we found many duck-footed birds, and some shamefully trimmed about the face. When will exhibitors learn that nothing spoils a hen like trimming? But the winners were fair birds. In *Brown Reds* chickens won the prizes, the first leaving little to be desired, and the medal for *Game* was awarded here. In Any other colour the first were *Duckwings* and second *Piles*, both being smart and good, but the first scarcely in full feather. One of the gems of the Show, however, was the *Brown Red cockerel* to which the medal for single cocks was awarded, this being perhaps in all points the best *Game* bird in the Show. The second was a good *Duckwing*.

Hamburgs were mixed classes. The first prize for *Pencilled*

and the medal for the best pen of *Hamburgs* went to an even pen of *Silver-pencilled*, the second being *Golden* also very good. In *Spangles* the *Golden*s stood quite clear of all danger, winning very easily, the first being an especially bright-coloured pen; but these lost the medal on account of the cock's comb being somewhat coarse.

The competition in *Game Bantams*, *Black* and other *Reds*, was very keen, many old and well-won pens putting in appearance, but these were beaten by younger birds; the first *Black* and second *Brown Reds*, a third also being awarded to *Black Reds*. Other colour of *Game* and all other varieties were shown together in the next class, and we would strongly recommend a revision of this section, for in this case many deserving pens had to be passed. The first were *Blacks*, second *Silver Sebrights*, and extra second *Duckwings*. *Cross-breeds* were a bad lot.

In the class for a single cock of any variety there was nothing striking if we except the first-prize *Dorking*. The *Variety* class was a very strong one, the first and medal going to a good pen of *Gold Polands*, second to grand *Spanish chickens*, and third to good *Red Malay chickens*; these, however, failed somewhat in that grand characteristic of the *Malays*—viz., an arched back. The *Selling* class was large, but, with the exception of a few pens, there was nothing good. *Ducks* had but one class, and here a most splendid pair of *Mandarins* won first, grand *Ronens* second, and *Aylesburys* third.

PIGEONS.—There were 190 entries in eight classes. *Carriers* were only moderate if we except the winners, which were *Blacks* first and second, and *Dun* third. In *Pouters* all the winners were *Whites*, the first a perfect bird in all respects, and a good show; the second, rather flat, was also good. *Dragons* had forty-seven entries of all the standard colours, and the contest

keen in all cases except for the first place, which was easily taken by Mr. Graham with a grand black-barred Silver, the second and third being Blues, twenty others coming in for mentions. *Fantails* were difficult to judge, so close was the run. The first was a perfect-tailed bird with good carriage; second came a large bird not so good in carriage, with a grand tail, both Whites, but the third was a capital Blue. In *Turbits* the first was Blue, and the second Yellow, spike-headed, and the third Silver with shell crown, the latter rather coarse. In *Tumblers* the first was an Almond cock, second a hen, and third a Kite. In the Variety class Mr. Yardley made a clear win with a good Black Barb, the second (a Yellow Jacobin) was most perfect, the third being a good Blue Foreign Owl. The Selling class contained some good birds, the first going to a White Pointer, second to a Blue Dragon, and third to a Black Carrier.

RABBITS.—There were two classes, and in these were forty-four entries, the Lops being a most extraordinary class, and such as it has never been our lot to see surpassed in measurement; out of eighteen Rabbits, one, a Black-and-white doe, being 22½ by 4½ inches in ear; one 22 by 5 inches, also a Black-and-white doe; one 22½ by 4½ inches, Tortoiseshell, a buck good in all points, but with a little cold in one eye; seven others coming up to 21 by 4½ and 4½ inches, the first three taking the prizes. In any other variety first was a good Silver-Grey buck, second a Himalayan doe, both grand Rabbits, while an Angora was third. The class was good.

THE All-England Show of Poultry, Pigeons, Rabbits, and Canaries, was held in the Drill Hall, Derby, on the 7th and 9th inst., at the same time as the annual Exhibition of Canaries by the members of the Derby Canary and Ornithological Society. At this twin Canary Exhibition there was a goodly number of first-class birds, but the Show taking place at the same time as the one at Norwich, the entries, as might have been expected, were but few compared to that. The fine Drill Hall is very well adapted for a bird show, but it is somewhat in the background and situated some distance from the railway station. On the whole the members' birds (164), and those shown in the All-England cage-bird division (146), added to the 544 entries of poultry, Pigeons, and Rabbits, made-up a very fine show indeed. I would recommend the Committee another year to have a day entirely set apart for judging, as it would do away with a great deal of confusion, which cannot possibly be avoided when a show is opened to the public almost at once as the Judges commenced their duties. The work of stage-erecting and the non-placing of the whole of the entered specimens in their respective positions in due time, are matters which very much retard the proper carrying-out of a show. The catalogue has assumed a more business-like shape than formerly, but the continuation of the All-England portion of the bird show immediately after the members' classes, without some note of explanation, is somewhat confusing. There is also room for improvement in the naming of the classes 36 to 39. As they appear, it is impossible that exhibitors can thoroughly understand how their birds should be entered. "Evenly-marked," and "Ticked or Unevenly-marked," can easily be understood by a novice in bird matters; but the very vague terms of "Marked" and "Variegated," is enough to puzzle the heads of the best of judges and the oldest of fanciers. Up to the very latest period on Saturday night I was unable to obtain a correct list of the prizes awarded; whether it was owing to the delay of forwarding them to the printers, or whether the distance between the show-room and the printers was too great, are also matters of consideration for the future. One thing is certain, exhibitors at a distance are ever anxious to know how their specimens "stand" as soon as possible. Perhaps the adoption of a system equal to that carried into effect at a cricket field would be better than nothing at all—the printing of a few of the returns as soon as given-in by the Judges. Where there is a detached prize list, a small printing press and a case of type would effect wonders in the way of expedition. And what a happy bit it would be if one of the Committee had a knowledge of the printing craft.—AN EYE WITNESS.

COCHINS—1 and Medal, W. White. 2, Mrs. E. Pryor, Welwyn. *vhc.* C. Judson, Peckham; Hon. and Rev. C. Vernon, Kettering. *hc.* W. Bentley, Teddington; Mrs. H. Strutt, Nourbridge; Mrs. E. Wilkinson, Manchester. *c.* Rev. K. Story, Derby; T. M. Derry, Gedney; J. W. Crosby, Bromwich. **BABIANA** *Portras*—*Dark*—1, C. Coppack, Chester. 2, R. P. Percival, Manchester. *vhc.* T. Webb, Sutton Coldfield. *hc.* H. Frost, Swansea; J. Robinson, Ulverston; J. Johnson, West Bromwich; H. Chawner, Uttoxeter; W. Branton, East Dereham. *c.* C. Coppack; — Holbrook, Derby. *Light*—1, J. T. Hinks, Lumberton. 2, W. T. Storer, Derby. *vhc.* T. Waterall, Lucas Grange. *hc.* J. C. Martin, Chesterfield; W. Thorn; R. P. Percival; Cronall and Sealey, J. Widdowson, Derby; R. E. Horsfall, Liverpool; H. Chawner. **GAME**—*Black Red*—1, C. Spencer, Thulstone. 2, F. S. Godsell, Stroud. *hc.* J. Lane, Burton-on-Trent; E. Clavey, Burton-on-Trent. 3, C. J. A. & H. H. Staley, Burfield; W. L. Blake, Llandaff. *Brown Red*—1 and Medal, H. E. Martin, Southport. 2, F. Sale, Derby. *vhc.* G. Bentley, Rickmansworth; C. W. Laxton, Market Rayson; J. Lane. *hc.* Miss Waters, Elsham; A. Peake, Somerby. *Any other variety*—1, Wingfield & Andrews, Sidbury. 2, F. Sale, *vhc.* E. Bell, Burton-on-Trent; Earl London, Derby; E. Winwood, Worcester. *hc.* J. H. Bradwell, Southwell. *c.* J. A. & H. H. Staley. *Cock*—1 and Medal, W. Ormerod, Todmorden. 2, E. Bell. *vhc.* J. E. Martin, *hc.* J. Calland, Heanor; F. Sale, Crowth; T. P. Lyon, Liverpool. *c.* C. W. Laxton; J. Cook, Worcester.

HAMBOURS—*Gold and Silver pencilled*—1 and Medal, J. Long, Bromley

Common. 2, H. Speakman, Nantwich. *vhc.* J. Smith, Lincoln. *hc.* H. C. White, Sutton Coldfield. *c.* J. Langley, Mickleover. *Gold and Silver-spangled*—1, T. E. Jones, Wolverhampton. 2, S. W. Hallam, Whitwick. *vhc.* J. Long. *hc.* Mrs. G. M. Rolls, Monmouth; M. M. Cashmore, Loughborough; H. C. White. *c.* Mrs. G. M. Rolls, Whitwick; J. Ward, Ashby-de-la-Zouch; C. Pickering, Kirk Langley.

HANTAMS—*Black and other Reds*—1 and Medal, A. Ashley, Worcester. 2, F. Shumach, Southwell. 3, S. Beighton. *vhc.* J. Oseroff; W. Barkerville, Manchester. *F. Sale*, H. V. Smith, *hc.* W. Tomkinson, Smallthorne; W. Griffin; D. Warren, Synton; Wingfield & Andrews; J. Richardson, Loughborough; A. Canty, Barton-on-Umber. *c.* Hockaday & Hearn, St. Austell; W. Branton. *Any other variety*—1, R. H. Ashton, Manchester. 2, Mrs. Wootton, Mapperley. Extra 2, R. Smith, Southwell. *vhc.* J. W. Lloyd, Kingston (2); J. Earnshaw, Rotherham. *hc.* G. Evans, Worcester; F. Shumach; J. Oseroff; S. Beighton; H. C. Holloway, Stroud; M. Leno.

CROSS BREEDS—1, J. Widdowson. 2, W. Kirby, Ashby-de-la-Zouch. **ANY VARIETY**—1 and Medal, Hon. and Rev. C. J. Vernon. 2, H. Yardley, Birmingham. 3, J. Richardson (Malays). *vhc.* Stott & Booth, Bury (Black Hamburgs); W. Cutlack, jun., Ely (Creve-Cœur); H. Chawner, jun. (Hoodan). *hc.* W. Dings, Faversham (Houdans); J. S. Rooth, Chesterfield (Malay); R. A. Boissier (Creve-Cœur); E. Brown, Sheffield (Spanish); W. L. Blake. *c.* Lient-Col. Conolly, Mickleover (Houdan). *Cock*—1, Miss Murray, Thulstone (Dorking). 2, W. Birch, Coventry. *hc.* R. A. Boissier, Penhurst (Houdan); A. and W. H. Silvester, Sheffield (Silver Scherger); C. Graves, Chesterfield (Brahma); R. Barrett, Stroud; H. C. Holloway (Cochin). *c.* W. Morris, Rose.

SELLING CLASS—1, J. Richardson (Brown Red Game). 2, J. Payne, Newark. 3, J. Smith. *hc.* C. Spencer; P. Hanson, Stouchouse; J. Staley, North Collingham (Buff Cochins); M. M. Cashmore (Dorkings). *c.* P. Hanson; J. Atkinson, Newark (Brahma).

DUCES—1, A. & W. H. Silvester. 2, J. White, Whitley, Netherton. 3, Mrs. Wootton. *hc.* S. L. Edwards, Tarporley. *c.* J. Brown, jun., Markfield; J. H. Bradwell.

PIGEONS.

CARRIERS—1, W. H. A. Muller. 2 and 3, S. D. Baddeley, Hereford. *hc.* C. T. Heric, Bandy. *hc.* H. Yardley. *c.* H. Yardley. **POUTERS**—1, W. Nottage, Northampton. 2, — Holbrook. 3, G. Foster, Northampton. *hc.* W. W. Watkin, Northampton; H. Yardley. *c.* D. M. Garalde, Manchester; R. Barrett.

DRAGONS—1, F. Graham, South Birkenhead. 2, A. Boote, Crewe. 3, R. Woods. *hc.* W. W. Watkin, Northampton; C. F. Heriiff, F. Graham (2); A. McKenzie; C. E. Chavasse, Sutton Coldfield (2); R. Woods, Mansfield; A. W. Wren, Lowestoft; C. F. Staunton, Sandy Mount; A. Boote (2). *c.* G. Bentley; A. and W. H. Silvester, *hc.* G. W. Burton, Chester; A. McKenzie.

FANTAILS—1, W. Walker, Burfield. 2, J. F. Loveridge, Newark. 3, H. Yardley. *vhc.* S. Swift; J. Walker. *hc.* W. Morris; J. F. Loveridge; J. Walker (2).

TURBITS—1, R. Woods. 2, A. Riddell, Lichfield. 3, L. Lawson, Preston. *hc.* Hockaday & Hearn; A. Riddell; H. Yardley; H. G. Poole, Bradford; A. & W. H. Silvester. *c.* H. G. Poole; R. Woods.

TUMBLERS—1, J. Peace. 2, H. Yardley. 3, R. Barrett. *vhc.* A. & W. H. Silvester. *hc.* C. E. Chavasse; G. Holloway, jun., Stroud; S. Curzon, Derby; L. Lawson.

ANY OTHER VARIETY—1, H. Yardley. 2, A. Manders, Norfolk (Yellow Jacobin). 3, T. Chambers, Northampton (Foreign Owl). *vhc.* J. Peace; R. Woods (Archangel); A. Manders (Red Jacobin). *hc.* C. F. Heriiff (Black Swallow); Mrs. R. B. Wood, Uttoxeter (Red Swallow); T. Chambers (Foreign Owl); W. Patrick, Kettering; R. Woods (Jacobin); — Thresh, Bradford (Barb). *c.* W. Nottage.

ANY VARIETY—1, L. Watkin. 2, A. Boote (Dragon). 3, J. Currie, Worcester (Black Carrier). *hc.* J. C. Adams, Rochdale; W. Brown, Northampton; J. Karsenaw; R. H. Ashton (2); J. Harrison (Barb). *c.* D. M. Garalde (Carrier) (2); L. Lawson (Trumpeter); R. Barrett; M. M. Cashmore (Carrier).

CAGE BIRDS.

BELGIAN—*Clear Yellow*—1, R. Whitaker, Darley Abbey. *Marked Yellow*—1, W. Woodward, sen., Derby. *Marked Buff*—1, R. Whitaker. *Variegated Buff*—1, W. Woodward, sen.

NORWICH—*Clear Yellow*—1, J. Clarke, Derby. 2, W. Woodward, jun. 3, A. Utton, Derby. *vhc.* H. Watson, Derby; J. Torr, Derby; Johnson & Hinds; J. Evans, Derby. *hc.* J. Bexson, Derby; H. Ball, Castle Donington. *Clear Buff*—1, J. Clarke. 2, Johnson & Hinds. 3, J. Torr. *vhc.* A. Utton; J. Evans; W. Woodward, jun. *hc.* H. Ball.

NORWICH—*Marked Yellow*—1, Johnson & Hinds. 2, J. Clarke. 3, J. Torr. *vhc.* J. Bexson; R. Whitaker. *hc.* C. Bishendon; W. Woodward, jun. *Marked Buff*—1, Johnson & Hinds. 2, J. Bexson. 3, H. Watson. *vhc.* W. Woodward, jun.; J. Torr. *hc.* R. Whitaker; J. Evans.

NORWICH—*Evenly-variegated Yellow*—1, H. Watson. 2, T. Newbold, Burton-on-Trent. 3, W. Woodward, sen. *vhc.* J. Lowe, Long Eaton. *Evenly-variegated Buff*—1, C. Bishendon. 2, A. Utton. 3, T. Newbold.

NORWICH—*Heavily-variegated Yellow*—1, Johnson & Hinds. 2, J. Torr. 3, H. Ball. *vhc.* A. Utton. *hc.* T. Newbold. *c.* C. Legg. *Heavily-variegated Buff*—1, Johnson & Hinds. 2, K. Whitaker. 3, J. Clarke.

NORWICH—*Green Jonque*—1, J. Torr. 2, C. Bishendon. 3, W. Jackson Burton-on-Trent. *Mealy Green*—1, H. Ingman, Preston. 2, F. Edwards.

NORWICH—*Variegated Crested Yellow*—1, F. Woodward. 2, J. Bexson. *vhc.* Johnson & Hinds. 3, J. Clarke. *Variegated Buff*—1, J. Torr. 2, J. Clarke. 3, A. Batelle, Ockbrook. *vhc.* J. Lowe.

NORWICH—*Any variety Crested Yellow*—1, R. Hodgkinson. 2, J. Bexson. 3, J. Torr. *hc.* J. Clarke. *Any variety Crested Buff*—1, F. Woodward. 2, J. Torr. 3, Johnson & Hinds. *vhc.* J. Clarke. *hc.* J. Bexson.

LIZARDS—*Golden-spangled Clear Caps*—1, R. Hodgkinson, Derby. *Silver-spangled Clear Caps*—1, — Legg. 2, — Hyde.

LIZARDS—*Golden-spangled Broken Caps*—1, W. Jackson. *Silver-spangled Broken Caps*—1, R. Hodgkinson. 2, W. Jackson. 3, J. Legg.

CINNAMONS—*Self Jonque*—1, A. Utton. 2, J. Bexson. 3, C. Dakin, Derby. *Self Mealy*—1, J. Bexson. 2, T. Newbold. 3, C. Legg. *vhc.* A. Utton. *hc.* J. Torr.

CINNAMONS—*Marked or Variegated Jonque*—1, N. Banks. 2, J. Torr. **GULDFINCH MULES**—*Marked or Variegated Jonque*—1, J. Bexson. 2, W. Ashworth, Derby. 3, A. Curtis, Burton-on-Trent. *Marked or Variegated Mealy*—1, R. Hodgkinson. 2, W. Ashworth. 3, A. Curtis.

GULDFINCH MULES—*Dark Jonque*—1, J. Bexson. 2, A. Curtis. *Dark Mealy*—1, Rogers & Kerry, Ripley. 2, W. Ashworth. 3, A. Curtis. *vhc.* W. Woodward, jun.; W. Jackson.

ANY VARIETY OF MULE—1, W. Ashworth. 2, A. Curtis. **NORWICH**—*Clear Yellow*—1, Orme & Ashley, Derby. 2, J. C. Salt, Burton-on-Trent. 3, J. Adams, Coventry. *vhc.* J. C. Salt; J. Adams; R. Whitaker. *hc.* J. Winfield, Burton Joyce. *c.* C. K. Cowley, Burton-on-Trent. *Clear Buff*—1 and 2, J. Adams. 3, J. Clarke. *vhc.* J. C. Salt. *hc.* T. Smith, Coventry.

NORWICH—*Marked Yellow*—1, J. C. Salt. *Marked Buff*—1, J. Adams. 2, J. C. Salt.

NORWICH—*Variegated Yellow*—1 and 2, J. Adams. *vhc.* J. C. Salt. *c.* W. Sherwin. *Variegated Buff*—1 and 3, J. Adams. 2, Clark & Newton, Nottingham. *hc.* J. C. Salt.

NORWICH—*Crested Yellow*—1, F. Woodward. 2, C. Hillier, Northampton. 3, Clark & Newton. *vhc.* Doman & Allen, Nottingham; Clark & Newton; Brown & Gayton, Northampton. *hc.* H. Watson. *Any variety Crested Buff*—1, F. Woodward. 2, G. Dutton, Burton-on-Trent. 3, Martin & Griffin, Northampton. *vhc.* Doman & Allen; Martin & Griffin. *hc.* Doman & Allen; W. Sh-rwaa; G. Cox, Northampton.

BELGIAN—*Clear, Ticked, or Variegated Buff*—2, G. E. Russell, Brierley Hill. 3 and *hc.* M. Leno, Markyate Street. *vhc.* R. Hawman.

LIZARDS.—*Golden spangled*.—1, Withheld. 2 and 3, R. Ritchie. *Silver-spangled*.—2, R. Ritchie.
CINNAMON.—*Jouques*.—2 and *hc*, J. Adams. 3, J. C. Salt. *c*, J. G. Edge. (*Mealy*.—1, G. Cox. *vhc*, J. Adams. *c*, J. G. Edge.)
GOLDFINCH MULE.—*Dark*.—1, G. Cox. 2, Miss B. Remrose. *vhc*, R. Hawman.
GOLDFINCH.—1, S. Roberts, Derby. 2, R. Hawman.
LINNET.—*Brown*.—1, R. Ward, Derby. 2, W. Carrick, Middlesbrough. *vhc*, J. Simmet, Derby.
BRITISH BIRDS.—*Any other variety*.—1, T. Newbold (Thrush). 2, H. Nicklison, Derby. *vhc*, E. Sandell, jun., London (Bullfinch). *hc*, J. Harrison, Derby (Robin).
PARROTS.—*Any variety*.—1, T. Gollibutt, Derby. *vhc*, J. F. Barrs.

RABBITS.

LOP-EARED.—1, T. Boyle, Blackburn. 2, T. Green, Moxley. 3, T. Davis, Southwell. *hc*, T. Schofield, jun., Manchester (2). *hc*, W. Canner, Leicester; A. Jones West Bromwich; T. Schofield, jun.; J. Wood, jun., Derby.
ANY OTHER VARIETY.—1 and Extra 3, T. Schofield, jun. (*Silver-Grey* and *Dutch*). 2 and *vhc*, J. Boyle (Himalayan and *Silver-Grey*). 3, W. Brunton (Angora). *hc* and J. Tebbutt (Himalayan); W. Patrick (Angora); J. Owen, Kettering (*Dutch*); A. Cauty (*Silver-Grey*).

GUISBOROUGH BIRD SHOW.

IN cage-bird circles Guisborough has spoken for the fourth time, and the Show of 1874, held on the 30th and 31st ult., has become an event of the past, except the chrouching of the doings at the annual Bird Show held at the Temperance Hall. Guisborough certainly has added to its hitherto-gained reputation during the past four years, even though it be simply no more than the holding of its annual Show. History speaks of Guisborough (in the North Riding of Yorkshire) in another way than with respect to birds. It is stated that the town is celebrated for being the first place where alum was made, but what part of the globe is credited with the discovery of the aforesaid useful article is not just now within my head to decide. Perhaps the Romans knew more about that matter than I do. I think I have seen it stated that it was first obtained from the East, and introduced into England in the year 1595 by Sir Thomas Chaloner. Now this may be all very well in its way, but as I feel somewhat more illumined than aluminous, I will adhere to the question of birds, and give below the details of such who were the fortunate winners with their little fiery-looking wondrous. Canaries now-a-days are wonders in reality—I do not mean all of them; only those which have undergone a certain course of treatment. Fanciers, mark the word "certain." Some undergo an uncertain course of treatment. Such can never be expected to become "little blazing gems of dazzling brightness." I might here ask the question of any breeder of Lizard birds, What success, pray, have you (anyone) had with putting your birds under the cayenne treatment? The answer perchance will amount to this: "It's a mistake, I've put my foot in it; no more pepper for me." Now hear with me with becoming patience, ye impatient fanciers; I'm driving towards Guisborough as fast as I can. One point is beyond all doubt: Sir Thomas Chaloner had nothing to do with the introduction of the Canaries and the numerous other feathered beauties which graced the stages in the Temperance Hall, Guisborough, during the two-days Bird Show. The supplies were furnished by exhibitors from various parts of England. One fancier, so the prize list announced, forwarded fourteen of his Canaries, and gained with them the equal number of fourteen first and second prizes, a feat I never remember being performed before. Lucky "John Adams, of Coventry!" Talk of being "sent to Coventry," I really believe many would like to go there; and if all is true that's whispered, a journey has recently been made with the object of becoming "fly" to the "ins and outs" of the pepper "dodge." It appears there is yet some "secrecy" existing. Respecting the above-mentioned fourteen first and second prizes, the same lucky fancier is not bound to repeat the like performance at every other show betwixt now and the holding of the great Crystal Palace Exhibition. I recollect it being once asserted in print that because one Mr. So and so had "swept the deck" at an exhibition held early in the season, he was "bound to win" at every other show following up to a certain period during that same exhibiting season. Now I consider that a very ridiculous and ill-timed assertion to make. Vain, excessively vain, as far as the writer's opinion of himself was concerned, because judges are not and will not be "bound" to one individual's way of thinking; besides, it exhibited a want of discretion on the on the writer's part.

Norwich.—Clear Yellows counted nine entries, and Clear Buffs thirteen. Mr. Adams took first and second in each class—an easy win. Mr. Stevens's Yellow, a "good 'un," was third, Mr. Winter's Buff occupying the like position, but rather small. Five Evenly-marked Yellow or Buff made up Class 3, the two highest prizes falling to Mr. Adams, and the third to Mr. Cox. Two classes were devoted to the Ticked or Unevenly-marked birds. There were six in each class, Mr. Adams being again to the front for two firsts and two seconds. Mr. Bexson won a third place in the Yellows, and Mr. Tenniswood a third in Buffs. The winning birds were full of fire, and in splendid trim. The Crested birds stood thus—Mr. Hawman's first, Mr. Hampton's second, and Mr. Cox's third.

Lizards.—Both classes mixed, which I entirely disapprove of. Entries scarce, but quality "up to the knocker." The first

prize, a Silver bird, won with the greatest ease, Messrs. Cleminson & Ellerton being the exhibitors of that and the third bird, a Golden-spangled. Messrs. Holdsworth & Oliver's second prize Golden-spangled bird was a fair specimen, barring cap and spangle.

Cinnamons, Jouques, first and second to Mr. Adams—an easy win. Third prize Mr. Burton, but much behind the two others in colour. Buff—Mr. Adams again to the front with two splendid birds, Mr. Cox claiming third place with a very good bird.

Yorkshire.—Two classes for Clear, and one for Ticked or Unevenly-marked. The chief winners were Messrs. Williams, Belk, Stevens, Winter, Rowland, and Garbutt. There were many smart-made, close-feathered birds, and the three classes were well judged.

Clear Green numbered six, Mr. Rowland claiming first honours, Mr. Stevens second, and Mr. Tenniswood third. All in good feather and condition.

Crested Copsy.—Mr. Garbutt's first-prize was well in for the position it justly occupied, and was much admired for its splendid crest. Mr. Belk, who exhibited a tolerably good bird, was likewise a winner in the next class, "Plain-headed." He exhibited a fine-shaped Yellow, and Mr. Thackrey followed up close with a Buff for second place.

Any other Variety.—Mr. Hawman was well in for a first with his Yellow Belgian, Mr. Belk ranking second with a fine yellow-marked York-hire. There were several birds of note in this class besides Messrs. Fryer & Holt's third-prize, some of which, no doubt, will be heard of at future shows.

Mules.—Mr. Bunting was first with a dark Goldfinch specimen, which met with a purchaser, Mr. Cox being second and Mr. Hawman third in the same class. In the Any other variety of Goldfinch Mules Mr. Bunting was again to the fore with a real beauty, full of size, bloom, and condition. Mr. Tenniswood stood next with a clean specimen, and Messrs. Moore and Wynn's Marked Yellow was third.

British Birds.—Here again Mr. Bunting was victorious with a somewhat showy-moulted Goldfinch, a likely-looking breeding bird, cheap too at the catalogue price of 25s. Mr. West was second, and Mr. Bishop third. There were eleven Goldfinches exhibited, but some were backward in the moult. The Linnet class contained twelve good birds, Mr. Burton's bird having the choice of places. Mr. Bunting was second, and Mr. Carrick third. The second and third-prize birds were much in favour. In the Any other variety of British birds there were several capital specimens. A Starling, exhibited by Messrs. Fryer and Holt, was richly deserving of the first place. This identical bird, it appears, had the misfortune of descending the chimney of a farmhouse. The bird was afterwards disposed of for an "old song," and was again re-sold at Stockton Show, where it took a prize. It was again successful as a prizewinner at Middlesbrough. These are the birds to sweep the deck.

There was a Selling class, in which twenty-four specimens were shown. The first prize was awarded to Mr. Thackrey's bird, although a coarse-looking one. Mr. Thomas Cleminson was awarded second honours, and Messrs. W. & C. Burniston third. There five entries in the class for "Cage of six varieties," Messrs. Cleminson & Ellerton being the winners of the first, Mr. T. Cleminson that of second, and Mr. Hampton third. The sixes throughout were very showy, especially the first and second-prize cages.

NATIONAL PERISTERONIC SOCIETY.—The members of this Pigeon Club will hold, between the hours of 7 P.M. and 11 P.M., on Tuesday, the 17th inst., at the Freemasons' Tavern, Great Queen Street, London, a show of Pigeons, including all the high-class varieties and Toys. Admission on presentation of address card.

HIVES: WOOD v. STRAW.

At page 415 Mr. Pettigrew says, "I think it has never been proven that hives with moveable combs are the most profitable." Perhaps not. No doubt as much honey can be got out of straw hives without bars as with them. The same may be said of wooden hives; but on the other hand it may be asserted without fear of reasonable contradiction that wooden hives with or without bars under similar external circumstances are equally profitable with those made of straw. Putting aside the question of mere profit, as to which there is not a pin to choose between the one system or the other, when we come to balance their *pros* and *cons* in other respects, who can doubt that in point of interest and perfect mastery of the science of bee management the wooden and the bar hives carry the day?

As a practical bee-master of the old school Mr. Pettigrew has no equal, but we of a later generation cannot allow the splendid achievements of our more scientific apiarists to be systematically snubbed, in *THE JOURNAL OF HORTICULTURE* too, which has for the last thirty years been the pioneer of all apian progress in England and America. Certainly the results of the recent Crystal Palace Show did not evidence any such practical superiority of the straw and stick hive management as Mr. Pettigrew persists in claiming; indeed it was quite the reverse. Nor

does his question put to "the principal bar-frame dealer" in his neighbourhood, and the answer thereto, settle the matter quite so triumphantly. Curiously enough that veteran bee-master, Mr. George Fox, of Kingsbridge, comes to the rescue, and gives the proof as to the at least equal excellence of the wooden bar-framed hives. His "adjusting" hive, "in which the arrangement of frames in the stock-box and bars in the adjuster have been carefully carried out," is fully the match of any straw hives I ever heard of; 93 lbs. of honeycomb in one year in one such adjusting super, and 112 and 109½ lbs. in two other supers are quite a match for the straw hive weighing "164 lbs. gross," the largest ever heard of by Mr. Pettigrew.

Pray let this controversy cease, and let it be allowed, both to Mr. Pettigrew to prefer his sticks and straw, all very good in their way, and to "B. & W." and others to believe that there is at least equal merit in the results of modern science. I express only the general sense of annoyance which exists at this constant nibbling by Mr. Pettigrew at those who differ from him.—B. & W.

HONEY HARVEST IN NORTH STAFFORDSHIRE.

THE honey harvest in this part of the country has not on the whole been very good; most of the bees being kept in very small straw skeps, and being very weak in the spring, have not done much service; but the few bee-keepers who have commenced using the 16 and 18-inch Pettigrew hives have done pretty well. I had nine such hives, seven of which I artificially swarmed, the other two not being fit at the proper time. One of these became very strong in bees, and filled me an 8 lb. glass super, and has since yielded honey very well; the other still continues weak. The outcome of the whole is three glass supers—8 lbs., 15 lbs., and 16 lbs. respectively; two straw supers, 5 lbs. and 12 lbs. respectively; 83 lbs. of honeycomb, being a 63-lb. hive sold to be run for honey, and 20 lbs. of white comb cut from the outside combs, and I could easily have cut 100 lbs. if there had been a demand for it, and 305 lbs. of beautiful run honey "fit to eat," giving a total of 441 lbs. of honey and 17½ lbs. of wax, besides a great amount of waste, which has been made into about eleven gallons of mead. This I think a very fair harvest from nine stocks in the straw hives so much despised by some apiarists, but which I venture to think the very best hive that is made where the greatest results are required from the least possible trouble and expense.

My present stock consists of five old stocks, one swarm, one turnout, and six autumn sugar-fed stocks—in all thirteen hives, three of the sugar-fed ones being in the so-much-vaunted bar-frame hives, which have been filled with sweet old combs, and I intend to test their merits fairly alongside the Pettigrew straw hive.

Three of my neighbours who have adopted the large straw hives in preference to the small ones have severally:—No. 1, from two spring stocks 65 lbs. of honey; No. 2, from three stocks 120 lbs., and a glass super about 16 lbs.; No. 3, from four stocks 150 lbs., besides a large quantity of refuse honey given to the driven and united bees in each case.—THOS. BAGSHAW, *Longnor, near Buxton.*

CRUDE IVY HONEY.

UNDER this head "B. & W." informs the readers of the Journal that honey gathered from ivy blossoms "tastes exactly like the leaves of the plant when chewed in the mouth, and is equally acrid, only, of course, much sweeter." Then he puts this extraordinary question, "Will Mr. Pettigrew say that this acrid taste is not existing in the crude syrup gathered in the flower, but is developed in the stomach of the bee when the honey has been reswallowed?" I have to say in answer that no intelligent person entertains such a thought. "B. & W." should know that bees have not the power to give the peculiar flavour to any kind of honey. No two different plants yield honey tasting alike; the peculiarity comes from the plant, and exists in the syrup found in its flowers. The bees, however, remove the crudeness, and sweeten as well as thicken the syrup or nectar. After honey has been twice swallowed and disgorged it is perfect, whether found in the combs sealed or unsealed.—A. PETTIGREW.

OUR LETTER BOX.

DORKINGS AT OXFORD SHOW.—Mr. Lingwood informs us that the cockerel in his pen, No. 11, was hatched on the 23rd of February.

HOUDANS (*H. B. P.*).—Your fancier either makes a mistake or does not know the fowls. Houdans are very hardy. It is the La Fleche that die suddenly. You may have twenty to all appearance in perfect health in the morning, and every fowl down before the evening. We consider the Houdans the hardiest of the French breeds. A pair of true birds will cost you from 40s. to 50s.

YELLOW FEATHERS IN BLACK HAMBOURNS (*P. S.*).—In nearly all black-plumaged cocks breeders are exposed to disappointment by finding red and yellow feathers in the backles and saddles, but this is confined to the cocks—Spanish, Cochins, and Polands. Although they are not considered disqualifications in Crève-Cœurs as long as they confine themselves to yellow, yet red feathers disqualify even in that breed, and it is desirable a cock should have

no colour. Nothing of the sort is, however, looked for in hens and pullets. At times a Spanish hen will become first patchy, then white, and we have known one moult black again, but this is a very rare exception. When we are told we are buying prize birds, and when we give a large price for them, we expect purity of breed, and we believe that such will throw pure chickens. If one or two pullets had shown white tips or white feathers we should be disposed to overlook them if the others were perfect; but when it is the rule of the produce we should feel aggrieved, and should complain. If we could not get an answer we should, after due notice given, complain publicly. Even if the seller was not aware they had any bad blood in them, he should offer you some redress. If you bought the pen that took first prize at a certain show, and you had them, you have no ground for complaint. You acted on the decision of the Judge, and bought certain fowls as they appeared in the pen.

RABBIT FOR EXHIBITION (*P. J.*).—Give only dry food—oats, peas soaked and well drained, and slices of carrot. No green food.

FOOD FOR BEES (*T. J. L.*).—Next to honey we prefer a mixture—1 lb. of loaf sugar dissolved in half a pint of water, and boiled for two or three minutes.

TERRIER (*J. W. L.*).—Put a piece of india-rubber court plaster on the wound where the wart was. When healed touch the wart with aquafortis, and repeat until removed. To destroy the vermin in the dog's coat, take enough soft soap to rub into the whole coat of the dog; add to this a teaspoonful, more or less according to the size of the dog, of spirits of turpentine; rub this mixture well into the roots of the hair, adding a little warm water to make it reach the skin. Let this remain on for a quarter of an hour, then plunge the dog into a warm bath, and rub off the mixture with the hand. Care should be taken not to let it get into the eyes, and to wash it completely out of the skin.

REMARKS.

4th.—Fine morning, and till the after part of the day, then not quite so bright, but warm.

5th.—Foggy till noon; then very bright for three or four hours; fog in the evening, but clear after 9 p.m.

6th.—Fine early, hazy at 8.30 a.m.; fine for a short time in the middle of the day, but dark very early.

7th.—Beautifully fine during the whole of the day.

8th.—Foggy at 9 a.m., and very much more so in the middle of the day; but clear at night.

9th.—Rather hazy early, but a very fine day.

10th.—Rather foggy, but bright at times.

A fine autumnal week, barometer higher, and temperature rather lower. Scarcely any rain.—G. J. SYMONS.

COVENT GARDEN MARKET.—NOVEMBER 11.

A CONTINUANCE of fine weather enables the growers of outdoor produce to keep us well supplied, so that very little variation in prices occur during the week. Dutch Hamburgh Grapes are nearly over, and good hothouse in rather better request; but a large quantity of inferior ones are on the market. The first cargo of St. Michael Oranges direct from the islands arrived to-day. The Potato trade is heavy; but samples of blighted ones not so prevalent as they were a week ago.

From observations taken near London during forty-three years, the average day temperature of the week is 43.2°; and its night temperature 34.1°. The greatest heat was 62°, on the 25th, 1863; and the lowest cold 9°, on the 25th, 1853. The greatest fall of rain was 0.95 inch.

THE FLOWER BEDS AT THE CRYSTAL PALACE.—No. 3.

AN important advantage belonging to the enamel bedding is that very few kinds of plants are really necessary to produce an endless variety of these floral pictures; thus, for example, none of the beds which I examined closely were precisely alike, and yet the two or three designs figured in the first paper nearly exhausted the list of plants used here for this purpose. Not that this list is by any means an exhaustive one of available

kinds, for there is a perfect host of alpine and succulent plants—gems of most exquisite beauty, which I hope to see gradually brought into general cultivation for this purpose, as well as for the decoration of rockeries. This is the point to keep fully in view:—A taste for enamel bedding, and a consequent interest in the formation of designs and management of the plants, have now become general; to foster and strengthen this feeling something more than mere variety of design is necessary, and if we only draw our supplies of fresh plants from the rich store that is open to us, the popularity of the system will extend as it becomes more interesting and ornamental, and, what is even more important, the public will become intimately acquainted with a class of plants hitherto neglected, simply from ignorance of their very existence. A single specimen of any dwarf hardy plant rarely attracts more than a passing glance, but a mass of it generally arrests attention, and induces a critical examination. There can, therefore, be no doubt that the enamel style of bedding affords greater facilities than any other for showing not only the intrinsic merit of a plant, but its relative value to others for decorative purposes; moreover, it appears to me that this is precisely such an educational work as comes within the scope of the managers of large public gardens. Popular education is fairly triumphant over the old, dry, cramming process; and when it points to increasing profits and bulky dividends, as it undoubtedly does at the Palace, it assumes an importance that is perfectly irresistible, and to which the duller director has a lively susceptibility.

Thus much of future measures. For the present, or rather next season, it is so important that beginners should clearly understand with how few varieties great things may be done, that I will give here a connected list of the plants now most used in such beds. 1, *Alternanthera amena*; 2, *A. versicolor*; 3, *A. amabilis*; 4, *A. magnifica*; 5, *Tagetes signata pumila*; 6, *Lobelia speciosa*; 7, *Coleus Verschaffelti*; 8, *C. Verschaffelti Improved*; 9, *Echeveria secunda glauca*; 10, *Sempervivum californicum*; 11, *Gnaphalium lanatum*; 12, *Cerastium*; 13, *Geranium Duke of Edinburgh*; and 14, *Iresine Lindeni*.

The border between the upper rosery walk and the wire arches, the arrangement of which is shown in fig. 121, (page 442), was magnificent. The plants were in capital condition, the colours skilfully blended and thoroughly well

balanced, and whether regarded simply as a beautiful border or as part of a grand whole, it was equally satisfactory. Frequent objections have been made to ribbon borders from the air of monotonous formality that is inseparable from a number of parallel lines, and the skilful manner in which this difficulty is overcome here is worthy of attention. The broad mass of rosy *Alternanthera* stretching along behind the pale silvery *Echeveria* loses all the stiffness of a formal band by the graceful way in which it is made to sweep outwards, meeting the curvatures and assuming the character of the central lines, enclosing completely within itself the pretty masses of pale yellow *Mesembryanthemum*; thus imparting breadth, substance, and a full rich harmony to the composition precisely similar in its effect to that of a deep mellow bass in music. Mark, too, the importance of the alternating masses of pink and deep rich scarlet, still developed with tolerable excellence in old *Christine* and *Stella*, and which glow with more than common brilliancy from the fine contrast of the silvery variegated *Geranium*, which is thus effective simply because its flowers are kept picked-off. Then glance across the border, and try to take in its full significance—the bounding line of silvery grey with just a bluish tinge first meets us, quiet it may be in tone, but wonderfully effective; then come the carmine, crimson, and pink of the *Alternanthera*, the soft dreamy yellow of the *Mesembryanthemum*, the deep blue of the *Lobelia*—deeper too and all the more striking from contact with the fleecy *Golden Pyrethrum* that comes in with such wonderful power between it and the deep rich crimson of the *Coleus* over which the eye lingers luxuriously as it passes to the refreshing brightness of the lighter variegation behind; while the masses of pink and scarlet, though detached, yet exercise a very similar effect in the position which they occupy to that of the *Alternanthera* in front; and behind all are the flowers of white *Geranium* nestling so charmingly among the abundant green foliage, and forming with it an appropriate fringe and foil to the more brilliant colours. My object in dwelling at such length upon this border is not only to assist the earnest teachable student, but to show to those who object to such displays, regarding them as a mere “flash of colour,” that there are meaning and expression in every mass, or line, or colour, hidden, perchance, from those who rail at a system which they cannot understand, but fraught with that significance and poetry which invariably belongs to objects of beauty formed or composed upon the sound principles of art, and which the cultivated mind and refined taste never fail to enjoy fully.

I found a good deal of excellent enamel bedding upon the terrace, but it is unnecessary to dwell particularly upon the arrangement of the plants. It was undoubtedly good in every instance; but a description would simply take your readers through a repetition of the plants already named. The beds upon the turf at the upper fountains, consisting of a series of circles and oblongs connected by bars about a foot in length, thus—○=○=○=○=○=○=○, and so forming a continuous chain, have a very pretty

effect. They were arranged in the old style, and I was pleased to see the chaste effect in them of a uniform edging of the pretty *Koniga maritima*, an old but most useful plant. The fine old variegated *Geranium Lady Plymouth* also told well; it is an excellent variety, and, so far as I am aware, is quite distinct from any modern introduction. The vases were in great beauty, being well filled, and with an abundance of blossom upon the plants. Some large circular beds on the semicircular lawn in front of the south corridor, treated in a remarkably bold style, were very fine. The centres contained a mixed mass of Dahlias and Hollyhocks surrounded by a belt of yellow Dahlias, alternating with white in the next bed; this was enclosed by another belt of a fine, dwarf, dark crimson Dahlia, blending beautifully with a band of dark *Coleus* placed in front of it, and with an edging of *Golden Pyrethrum*. There were ten of these, beds and as they were placed singly, and some distance apart, near the margin of the curved part, they embraced nearly the whole of its bold sweep with excellent effect.

A detailed account of the planting in every bed or design

has a nice nutty flavour. The plant is easily grown in a pot in a stove, is about 1 foot high, and has rather pretty yellow flowers. Half way up the stem a root shoots out and turns down to the earth, where it forms a new *Pea Nut*.—W. D. A.

THE SAWFLY ENEMIES OF OUR FRUIT TREES.

Amongst the family of the Sawflies there are numerous species which prove more or less injurious to our fruit trees. Never a season passes, probably, without a certain per-centage of loss arising from these insects, which from their peculiarities of habit are often difficult to deal with. Some cultivators know only too well several species of the genus *Nematus*, allied

has not been given, because it would be neither interesting nor instructive. I have striven rather to impart a critical tone to these papers in order to render them really useful, and I should be glad to take part in a discussion of the various systems of outdoor floral arrangements in the pages of the *Journal*; for I am sure that the very marked advance in taste and culture, or rather in art knowledge, that was evident in these and other public gardens which I have visited this autumn, must inevitably lead to a similar improvement generally. But the mere copyist can never do this well, there must be a thorough knowledge of the principles which rule all art works; and just in proportion to the mastery of this and its intelligent application will be our success in imparting depth, meaning, and fulness of expression to the association of what is elegant in form or beautiful in colour.—EDWARD LUCKHURST.

AMERICAN PEA NUT.—In answer to "Co. ANTRIM," page 408, this Nut is produced by *Arachis hypogæa*, a native of tropical Asia and Africa, and is imported in large quantities to Europe for the manufacture of salad oil; it is used in the United States roasted like Chestnuts, and eaten in theatres, &c. It

to the familiar Gooseberry fly. The parent Sawflies deposit their eggs in clusters on the branches, and the gregarious caterpillars, which seem to feed by night as well as day, make sad havoc with the leaves, and also influence the productiveness of the trees, principally by the obstruction they cause to the due leafage and development: so some have suggested that they actually poison the sap of the trees or plants they attack. Then, also, though fortunately these insects are not so generally distributed, species belonging to the genus *Lyda* visit Apple and Pear trees, *L. Pyri* especially forming disagreeable webs in which the larvæ partially secrete themselves. But not trusting entirely to the protection of this common habitation, each individual forms a separate case for itself, which may be either entirely of silk or partly of rolled leaves, resembling somewhat those formed by some of the small moths of the Tortrix tribe. Scarcely any of these larvæ move with any degree of rapidity, for they are without abdominal legs, though they possess two horny projections at the anal extremity; yet they are not easily extirpated, from their habits of concealment, and there really seems no better way than the removal and destruction of all branches seen to be infected.

Then there is that species which escapes notice on the wing, because it comes forth at a season when flying insects are abundant—namely, in May and June. This has been expressly named the Apple Sawfly, and perhaps it confines its attacks to that fruit; in science it is known as *Tenthredo testudinea*. Professor Westwood tells us that he has watched the females busy amongst the Apple blossoms, but they are so sensitive to alarm that he could not approach near enough to see the deposition of the eggs, which are probably placed in, or close to, the calyx. The fly, which is about three-quarters of an inch across the wings, has the upper surface of the body of a brilliant black, the sides of the head, antennæ, legs, and under side orange freckled with brown. The eggs are doubtless some little while ere they hatch. As soon as the fruit has made such progress as to afford the larvæ food they lodge themselves comfortably within the Apples, and the particular ones they favour of course go to swell the number of "windfalls," since

their proper ripening is impossible, and such infected fruit may be expected to make its way to the ground during July—accompanied by its internal enemy, let it be noted, for the larva sagaciously remains within until the Apple falls, to save itself the trouble of a long and perilous journey to the earth. This event having taken place, it very speedily pierces a hole in the rind, and seeks a convenient spot to bury itself. The larva of *T. testudinea* is directly distinguished from a Lepidopterous larva by its possession of twenty legs, exceeding by four the "regulation" number among the caterpillars of butterflies and moths, which does not go beyond sixteen, though falling as low as ten. Another peculiarity is that the body is very much wrinkled, the ground colour being a dull white with a pink line passing down the back; the head is tawny. As will be surmised, the pupation lasts through the winter.

It is to the species known as *Blennocampa* or *Selandria Cerasi* that I wish particularly to draw attention, because I rather apprehend that it will give us some trouble if we do not watch it. In America species of the genus have been recognised a long time by horticulturalists, and they are popularly called "Slug worms," not unsuitably. Some of them were noticed by Réaumur, who also termed them slug larvae. Of course, any person unacquainted with entomology would hardly credit the fact that flies will be developed from these, the aspect is so entirely different from that any ordinary larva presents. There are upwards of thirty British species of this genus. All do not, however, mask themselves from danger in this peculiar way, for protection is, I suppose, the object of the slimy disguise. Feeding only by night, and remaining on the leaves throughout the day, this exudation shields the larva from the summer or autumn sun, and may also ward off the attacks of parasites to some extent—only to an extent, though, for it may be assumed that *B. Cerasi*, like every other species, has a parasitic foe. How and when it makes an effective inroad upon the slime-clad larva is as yet a mystery. Slug-like as the larvae of *B. Cerasi* look, they are provided with the usual complement of legs, but they are very short, and the head being retractile and drawn under the next segment completes the deceptive appearance. In North Kent and other districts near London these larvae have been abundant throughout the past season, though in many places they seem to limit themselves to the Hawthorn hedges, which presented a sickly aspect, being attacked by *B. Cerasi* ere they had hardly been able to rally from the inroads of the little Ermine Moth (*H. padella*), which, owing to the backward summer we had, spread its unpleasant webs upon the bushes later than usual.

Gardeners and nurserymen, unfortunately, are not sufficiently alive to the necessity of dealing promptly with this species. It is folly to wait until it attacks fruit trees. When it has shown itself upon the Hawthorn we may be sure there is every probability that it will not stop short there, but make its way at last to Plum, Cherry, or even Pear trees, should such be handy. Observations with regard to *B. Cerasi* are as yet too few to enable us to judge as to what influence atmospheric phenomena have upon the species. In some districts in the midland counties it was seen in comparatively small numbers for three years preceding 1869; that year and 1871 it appeared in hosts, and was then noticed to decrease somewhat. In other parts of England it was exceedingly abundant in 1871-72; during the following year we did not hear much about it, and now it has again been troublesome. I am inclined to think that cold winds do not much affect the insect. Heavy rains would possibly annoy or destroy it by removing its exudation, and washing it from the leaves. Powdered hellebore has been proposed as a remedy, but as the editor of the "Entomologist" remarks, this is not a convenient nor a cheap application, even if proved effective. To pick the larvae off would be a hopeless task, and syringing with some of the approved compounds now in use may be deemed as likely a plan as any.—J. R. S. C.

SURPLUS VEGETABLES.

In the Journal of October 29th I noticed a suggestion by a correspondent signing himself "BETA," to the effect that in large gardens where there are so many surplus vegetables, it would be a better plan, instead of throwing them to the rubbish-heap, to sell them to the greengrocer. Now I should like to suggest an amendment to that plan. Very often where there is a large garden there is a farm attached to the estate, and of course there would be a number of men employed; now I think where they could afford to throw so many vegetables away, they could as well afford to give them away; of

course I mean to those employed on the garden and farm. For instance, at the place where I am living till lately all the surplus was thrown away, but now almost everything that is not absolutely required in the house is sold; there are six of us in the garden, and more than that number on the farm, and though we should be glad of a few vegetables, we never have any given us unless we ask, and we are not very fond of begging. As we work from six till six in summer, and from light till dark in winter, we have not much time to enable us to raise any for ourselves, and so we should consider it a great boon to get a few vegetables given to us now and then, and I think the loss would be very trifling to our employer.—F. W.

ANRICULAS.—No. 2.

ALTHOUGH in white edges both edge and paste are circles of white, yet they do not by that similarity lose all powers of contrast. There is always a delicacy of difference between the hoarfrostiness of the edge and the heavy snowfall on the paste. I think there is no lovelier form of the flower than the true white edge. It is the Anricula in her modest glory, in her bridal dress.

But as with the noble green edges, so with the gentle whites, the truly great are few. Smiling Beauty is the best one out. I make that reservation because I possess a plant of a young sort that is destined to beat Beauty everywhere but in her constancy. She is never out of character, and the young sort sometimes sports a little into undue size of its golden tube. But it will lead the beautiful class with its marvellously broad round petal, brilliant snowy edge, laid on as in no other; ground colour rich black velvet, delicately worked upon the pip; paste dense and brilliant; tube bright gold. As I am not the raiser I may say so much for this white seedling. Next to Smiling Beauty comes Taylor's Glory, and although I shall notice some other good whites, these three are the most perfect we have. Glory equals Beauty in its true white edge, but the body colour is a reddish violet plum, while that of Beauty is velvety black. Beauty is always circular in paste, and Glory wavy, by which it loses a point.

The failings of white-edged flowers are not few. Petals in this class are often pointed, and sometimes a little lacking in substance. Smith's Ne Plus Ultra is a really fine white, with rich chocolate ground colour, petals a little pointed. Smith's Ann Smith has a snow-white edge, ground colour a cold blue steel with a dash of violet, petal pointed. Lightbody's Countess of Dunmore is a fair white with chestnut ground, pip too pointed. Smith's League a good white, black body, petal pointed.

In properties of edge a common fault is that it is not dense or white enough. Hepworth's True Briton is fine as a white, but is often only a heavy grey edge; its petal is a model of breadth and smoothness. Such flowers as Trail's White Rival, Hinchcliffe's Lily of the Valley, Lowe's Maggie Lauder, Smith's Lady Sale, and Pott's Regulator are often only grey edges of various intensities; but can all come white, the last two are the best of them. Cunningham's John Waterston is a bold good flower, and classed as white, but like too many of them is frequently a grey. Again, in some varieties the white edge is dingy, or soon turns sere. This last is a fault in Taylor's Favourite and Lee's Bright Venus. In Popplewell's Conqueror and Lightbody's Fair Flora I have never seen a clean white edge at all.

In body colour the fault is mainly that of impurity, the meal creeping over it as in Countess of Dunmore, and notably in that nondescript Fair Maid, which should never have been sent out at all. Lee's Earl Grosvenor has occasionally come impure with me, but is mostly correct, and a very fine sort, and very late. Summerscale's Catharina and Ashworth's Regular are two real white edges, but under-sized. Regular is beautifully correct. McDonald's Miss Arkley is a little small as well, but a glowing flower, the white edge contrasted with a warm crimson ground colour that in certain lights produces an effect upon the flower like that of sunset upon snow. Lightbody's Robert Trail is an enormous plantmaker with rich pips, sometimes white-edged, and often too small and cramped in the two outer zones. Campbell's Robert Burns is fair, and Cheetnam's Countess of Wilton is a good old white.

All that I have named are worth growing, except Maggie Lauder, White Rival, Fair Maid, Fair Flora, Countess of Dunmore, and Popplewell's Conqueror. These are particularly beautiful in habit of foliage, but will not do for the exhibition table. Of the white-edged class, however, as a rule, we

must at present say that with all their faults we love them still, and I am not, therefore, to be understood as utterly condemning a flower because I mention its weak points, only we must naturally prefer those that have fewest.

And now we come to the selfs, or, as the old Lancashire men have it, "self-edged," and that not inaptly, for the breadth which in other classes is a belt of green, grey, or white, is in the selfs occupied by the body colour extending, without change of shade, to the petal edges. Hence the importance in this class of a bright yellow tube and brilliant broad paste, without which the flower has a heavy sleepy look. Selfs are not only a lovely class in themselves, but their effect among the others at blooming time is very grateful. Their quiet colours afford a rest to the eye that is confused by the rich jewelry of unrelieved masses of emerald greens, and pearly greys, and frosted whites. We have black and very dark selfs in Netherwood's Othello, Pohlman's Garibaldi, Spalding's Blackbird, Smith's Mrs. Smith, Sim's Vulcan, Walker's Nimrod, Kay's Topsy, Turner's Master Hole, and King Coffee, a seedling raised here; crimson in Campbell's Duke of Argyll and Lord Lorne; violet in Smith's Garland, Barker's Nonsuch, Smith's Pensioner, Clegg's Blue Bonnet, Whitaker's True Blue, and Turner's Cheerfulness; bluer shades in Spalding's Metropolitan, Lightbody's Meteor Flag, Smith's Formosa, and Hey's Apollo, affectionately called "Old Poll." We have various maroons in Sim's Eliza, Spalding's Bessy Bell, and Miss Brightly and Mary Gray; browns in Campbell's Pizarro and Headly's Petronella; dark crimsons in Lightbody's 172 and Lord Clyde; a lovely carmine lake in Berry's Lord Lee, though it has no paste; and yellows in Gorton's Stadtholder and Goldfinch, and best of all B. Simonites, a seedling of which my friend the raiser has but two plants and I the third.

Many selfs have a pale or watery tube, giving the flower a weak and vacant look. This is a class defect, and must be worked out. Most of them possess also a central depression or notch on the petal edge, whereas they ought to be perfectly Rose-leaved, as in Othello, Garibaldi, Nimrod, and Topsy. All selfs are flowers of thinner texture than the edged ones, and so bloom the earliest and pass away the first. Late-flowering selfs are much needed, and this is a valuable property in Duke of Argyll. It is the latest and one of the best selfs, a substantial crimson flower with splendid golden tube and brilliant white paste, but with the central notch. I have some scores of seedlings from it, and one gem already.

Out of the selection of selfs I have given I will briefly pick the best. Othello, Garibaldi, Blackbird, Mrs. Smith, Nimrod, Topsy, Master Hole, Duke of Argyll, Lord Lorne, Garland, Pensioner, True Blue (old rare sort), Spalding's Metropolitan, Meteor Flag, Eliza, Bessy Bell, Pizarro, Petronella, and Lightbody's 172, that puts aside Lord Clyde. My black seedling King Coffee is a young sort of only four plants. I wait to see if it keeps to its maiden promise of goodness.

In all I have said I have been guided by careful notes made of sorts that bloom in my own collection every year. I have also been intimate with them in other collections too, and I am quite aware that in some details, particularly in ground colours, all growers might not quite agree with me. The fact is that soils, localities, and air so variously affect the exquisite sensibility of the Auricula, that half a dozen growers from different counties might almost as much differ over the precise tint in a variety of the Auricula as the three worthies in James Merrick's familiar poem, who each of them thought that he knew best the real colour of the chameleon.—F. D. HORNBER, Kirkby Malzeard, Ripon.

FLOWERS WHICH OPEN AND CLOSE AT FIXED HOURS.—Sir John Lubbock, M.P., in his very interesting paper read at Belfast at the late meeting of the British Association held there, thus pleasantly alluded to this peculiarity among some of our own wildings:—"Many flowers close their petals during rain, which is obviously an advantage, since it prevents the honey and pollen from being spoiled or washed away. Everybody, however, has observed that even in fine weather certain flowers close at particular hours. This habit of going to sleep is surely very curious. Why should flowers do so? In animals we can understand it; they are tired, and require rest. But why should flowers sleep? Why should some flowers do so and not others? Moreover, different flowers keep different hours. The Daisy opens at sunrise and closes at sunset, whence its name, day's-eye. The Dandelion (*Leontodon Taraxacum*) opens at seven and closes at five; *Arenaria rubra* is

open from nine to three; *Nymphaea alba* from about eleven to four; the common Mouse-ear Hawkweed is said to wake at eight and go to sleep at two; the scarlet Pimpernel (*Anagallis arvensis*) to wake at seven and close soon after two; while *Tragepogon pratensis* opens at four in the morning and closes just before twelve, whence its English name, "John-go-to-bed-at-noon." Farmer's boys in some parts are said to regulate their dinner-time by it. Other flowers, on the contrary, open in the evening."

THE POMMIER DE PARADIS, OR FRENCH PARADISE STOCK.

A FEW years ago Mr. John Pearson, of Chilwell, a gentleman of great knowledge and experience in these matters, expressed an opinion in the pages of this Journal that the Pommier de Paradis of the French nurseries is a plant ill adapted as a stock on which to grow Apple trees in this country. This opinion was at once endorsed by Mr. Rivers, of Sawbridge-worth, a gentleman whose experience on such matters cannot be gainsaid; and both gentlemen gave instances in their experience why they had arrived at that conclusion. A very exhausting statement on this subject will be found by Mr. Rivers in vol. x. of this Journal at page 193.

In the same volume will be found some communications on the same subject by Mr. Scott, a nurseryman at Merriott, near Crewkerne, in which he contradicts the statements of Mr. Rivers, Mr. Pearson, and of the most eminent writers on the subject from Philip Miller downwards. I cannot follow the language he uses to these gentlemen in his controversy with them, but the tendency of his observations is to show that they do not know the true Pommier de Paradis, but that he does, and that he uses it exclusively as the best stock on which to grow Apple trees. He says, "The more I see of the true Pommier de Paradis stock the more I am convinced it is the stock to graft large Apples upon."

Fig. 122.

It was very important that it should be ascertained what the true Pommier de Paradis is, and also what Mr. Scott's Pommier de Paradis is. Mr. Scott communicated to Dr. Masters, of the *Gardeners' Chronicle*, some remarks on his stock, accompanied with specimens of the fruit, and to the kindness of that gentleman I am indebted for a specimen of the fruits, and from which the following figure and description are taken. The Royal Horticultural Society also moved in the matter, and procured from the most reliable sources in France trees of the true Pommier de Paradis, and through the careful management of Mr. Barron at Chiswick they have this year produced fruit. The result of this experiment is to prove that Mr. Scott's stock is not the Pommier de Paradis at all. The accompanying figures and descriptions taken from the respective fruits will convince anyone of the truth of this statement.

THE POMMIER DE PARADIS.

Fruit (fig. 122) with a balsamic fragrance, round, very angular, with prominent ribs on the sides, which extend to the apex, where they form sharp ridges, giving the fruit the appearance of

a small Calville. Skin smooth and shining without any trace of russet, greenish at first, but when kept of a fine lemon-yellow colour, with a faint blush on the side next the sun. Eye closed, set in a deep and ribbed basin. Stalk over half an inch long, slender, and rather deeply inserted. Flesh white, firm, crisp, very juicy, and briskly acid, with a fine balsamic aroma. Ripe in the middle of August.

MR. SCOTT'S STOCK.

The fruit (fig. 123) is small, very much like a russeted Golden Pippin, obtusely conical, even in its outline. Skin yellow, much covered with patches and reticulations of rough brown russet. The eye is very small and partially closed, with very short segments, and is set in a shallow narrow basin. Stalk half an inch long, slender, inserted rather deeply in a narrow cavity. Flesh yellowish, rather soft and spongy, not juicy, sweet. Core very small.

Fig. 123.

It is quite evident, therefore, that whatever may be the merits or demerits of Mr. Scott's stock, it is not the true Pommier de Paradis.—H.

VIOLETS.

I was written to last season by a Violet-grower because I spoke favourably of the Russian variety, when I said something to this effect, "that no other variety would take its place in every way." But I wrote advisedly, although I admit it is poor in shape, in length of stem, and is surpassed in colour; yet for freeness of flowering I have not seen anything to compare with it, if duration is added too. Brandyana is equally free, but only of about three or four weeks' duration.

I have had plants of the old Russian, that, apart from the flowers, could be covered with an egg-cup, with twelve or sixteen fully-expanded blooms at one time, others that could be covered by a teacup, with quite three times that number, so that for pots or in a border it is simply beautiful; but of course there must be culture for this, and then the blooms are generally all erect, which is not the case with many varieties—Devoniensis, Crimean, London, and some others for example. Of course I admit that the old Russian is far surpassed as a market Violet by many others on account of their shape, length of stem, size, and their colour too.

What I am anxious to get is not only size, scent, and colour (this we have in Victoria Regina; length of stem we have in many single varieties, as Devoniensis, London, Crimean, and The Czar), but erect habit and profusion of bloom. I do not dispute that Victoria Regina is the greatest improvement that has ever taken place, but that there is not very much room for improvement even now I must deny. Who would have thought some forty years ago of such a group of Cyclamens as Messrs. Veitch staged last March at South Kensington? Setting aside size, shape, colour, &c., and taking only the number of blooms on a plant, in a comparatively small pot you might have counted from five to nine dozen fully-expanded blooms; whereas the same size plant and pot forty years ago would have been all but a wonder to have had nine or ten, instead of so many dozen; and why may we not hope for something like this in the Violet?

I find Mr. Abbey is not favourable to growing Violets in pots. When I wrote the last paper for the Journal I had not tried to do this, and even now I know comparatively little of pot-culture; but since then I have learned that to produce them anything like passable they must be kept in a cold pit or frame near the glass, with the lights off every fine day, and with as much air as possible when it is raining, with a temperature as cool as can be, so long as it is above freezing. Apart from this there are drawn foliage, small flowers, weak stems—indeed anything but an agreeable sight; and even suppose

it is the temperature only that is too high, admitting that there is abundance of air during the day, you may get a dwarf compact habit of growth of plant but obtain no flowers. Just such were Mr. Mooreman's plants at the South Kensington Exhibition last March. Yet I am inclined to think that with a little practice we might have not only passable but even ornamental plants for the greenhouse or conservatory from November till March, which would, I think, be an acquisition. Of course there must be a supply kept up from cold pits, as the plants would soon become unsightly in the heat. It was intended to offer a number of prizes to promote this result, to begin at the first meeting in the year, to be repeated in February and March, and again in November and December, but I was unwell when written to, and could not attend to it; but if growers of Violets will give their attention to it another season, I may hope for something of the kind.—GEORGE LEE, Clevedon.

THE POTATO SEASON OF 1874.

THE Potatoes have had a very trying season to contend with in this neighbourhood. Frost did not take its final leave of us until after the 21st of June, and then severe drought set in, accompanied by great heat, which nearly prostrated the plant; indeed, the Ashleaf and other early varieties succumbed, and were prematurely ripened. They were taken up in the beginning of August; the crop was good, but they ran small.

The drought at that time had been so severe that the late varieties had scarcely formed any tubers, but from the 7th to the 16th of August we had $\frac{1}{2}$ inch of rain, after which they commenced to grow at the top in a most vigorous manner. In the last week of September the disease began slightly to show itself, and they were at once lifted. The crop was good beyond expectation, and many of the tubers very large, with no disease at the root, and a very slight amount of super-tuberation. They were put up in long narrow graves, in a fortnight were examined, and were then found to be half and in some cases more than that bad, and so rapid had the course of the disease been that many were quite rotten. The Dalmahoya were the least affected; the Pink-eyed Regents, York Regents, and Dunbar Regents being the worst. Sutton's Redskin Flourball, as usual, stood the best, and the quality is better than it is ordinarily, owing, I suppose, to the heat and drought. Those grown in the field surpass those produced in the garden in point of quality. It is becoming a great favourite with the cottagers, who appreciate its heavy-cropping and disease-resisting qualities. In looking over the cottage gardens and allotments for judging on the estate of H.R.H. the Prince of Wales last summer, comprising five parishes, that variety was found to be very generally cultivated, and the growers rather proud to be able to point out a good patch of Redskins.

I have always thought that the Potato was the most subject to the disease at a certain stage of its growth—viz., a short time before arriving at maturity, but I have a pit planted September 4th, the plants now about 15 inches high, and within the last few days they have been stricken very badly, with scarcely a bit of green left.—J. PLATT, Gardener to Sir W. Fjolkles, Hillington.

WHITE FLOWER FOR THE HAIR.

WHITE flowers suitable for decorating ladies' hair, bouquet-making, &c., being somewhat scarce, or at any rate not easily to be obtained all the year round by people who are not aided by a stove or hothouse, the plan which I adopt for supplying a want which is I think frequently experienced is as follows:—Take a bloom of any good white Fuchsia with a white tube and sepals not reflexed; holding the tube between the finger and thumb of the left hand, with the other hand remove the coloured corolla with a dexterous twist and pull. This leaves a beautiful cruciform flower of the purest white, somewhat like a gigantic Jasmine. Half a dozen of these made into a bunch with a little green or white tissue paper and a spray of Maidenhair Fern make a charming ornament for a lady's head, and one which will puzzle the uninitiated immensely. These blooms can also be wired for bouquets, and used in many ways. They are of a good firm texture, and stand hot rooms very well. The few people to whom I have shown the result like the effect of the flowers very much.—SALOPJAN.

[There can be no two opinions as to the beauty of the arrangement, but as it is not every one who could give the

"dexterous twist," we think the corolla might be more safely removed by the agency of a pair of sharp and pointed scissors. —EBS.]

UNHEALTHY PEACH TREES.

IN Mr. Luckhurst's article on Nectarines (see page 395) he mentions triple buds. Am I to understand that triple buds are the only ones that produce fruit next season? If such is the case I shall certainly have but a poor crop. If it is so, am I to prune all the shoots away that have no triple buds? I notice on my Peaches a good many little short stubby spurs about an inch long thickly studded with buds; are these likely to produce fruit? My Peach trees this spring have been terribly infested with a small shining black insect like a fly or very small beetle no larger than green fly, and they have appeared more or less all through the summer. They completely cover the ends of the young shoots. Can you tell me what they are, and advise a remedy? I intended to have the wall well dressed with hot limewash, wash the trees with soap and water, dress them as usual, remove 3 or 4 inches of the top soil, and give a dressing of some sheep dung, covering with some fresh loam.—INQUIRER.

[In doing work and telling how it is done, one strives to exemplify as high a standard of excellence as one can. It was for this reason that so much stress was put upon the merits of triple buds, because an abundance of such buds shows that the trees are in precisely the best possible condition of health and fruitfulness, and that in their culture the happy medium has been attained between a gross crude growth, or sterility, on the one hand, and a weakly diseased condition with under-sized poor-flavoured fruit on the other. The statement of "INQUIRER" shows plainly that his trees are in a very sickly condition. Instead of feeling anxious about obtaining fruit next season, his chief concern should be first of all to get the trees into a robust and healthy state, and depend upon it fruit plentiful and excellent will follow. It may, however, be a matter of considerable importance to "INQUIRER," that his trees should produce some fruit next season, and he may certainly obtain some from the spurs that are "thickly studded with buds," and also from the single flower-buds which frequently abound upon the slender growth of such weakly trees, but none of the fruit will do him credit.]

Bold and decisive measures should be adopted in the treatment of such trees. Let the roots and the soil in which they are growing be thoroughly examined, and if either prove faulty lift the trees. Mark a square space 6 feet by 6, taking out the soil 2 feet 6 inches deep, replace it with a 6-inch layer of stones or other hard rough material, and 2 feet of sweet rich loam; failing which only discard any of the subsoil of a crude sour nature, and enrich the soil with a liberal dressing of some gritty material, such as road scrapings, some broken charcoal, old well-rotted manure, and a little lime, mixing all together thoroughly. Then cut off any diseased or broken roots, and replant. If the situation is low or damp it will be necessary to connect the stations with the garden drains. If, however, in the first instance the roots appear to be healthy, and the drainage all right, the trees need not be lifted, nothing more being required than top-dressing with fresh loam and sheep dung, which should be mixed together and not applied in separate layers. All the very weak shoots should be pruned away and the leading growth shortened; then by applying water abundantly both to foliage and roots in the ensuing season, a better state of things may be confidently expected.

The insect with which the trees have been infested was most probably *Aphis Persicæ*, and the proposed curative will, doubtless, answer very well. Due caution should be exercised in dressing the branches to prevent any buds being damaged or broken off. Once get the trees into a vigorous healthy condition and this pest will not prove so troublesome, weakly trees being much more subject to its ravages than those that are sturdy and robust.—EDWARD LUCKHURST.]

DEATH OF MRS. HOOKER.—It is with great regret that we announce the death of Mrs. Hooker, of Kew, which happened on Friday last, the 13th inst., in the forty-ninth year of her age. Mrs. Hooker was a daughter of the late Professor Henslow, of Cambridge; and inheriting the tastes and genius of her father, was a fitting qualification for her to become the wife of the distinguished President of the Royal Society and Director of Kew Gardens. Mrs. Hooker translated *Le Maout and De-*

caisne's "Traité Générale de Botanique," which was edited by her husband; and we are sure that all who know Dr. Hooker will sympathise with him in his bereavement.

DO GRAPES RIPENED IN SPRING DIFFER IN FLAVOUR FROM AUTUMN-RIPENED?

HAVE any of our foremost Grape-growers noticed the difference in flavour between Grapes forced or ripened in early spring and summer, and Grapes ripened in autumn, the season of their natural maturity? and if so, would some such growers of Grapes, whether for exhibition or profit, inform us how far the flavour is affected, and in what particulars, by the mode and period of cultivation and ripeness? Can Grapes be pronounced ripe, in full flesh and flavour, at any time other than when Nature has decreed? or can Grapes be accepted to be dead ripe ere the fruit and leaf shoots of the Vine are brown ripe, and the foliage varied from green to its autumnal tints?

I am thinking, too, whether seeds from Grapes ripened out of their proper season—autumn, would germinate and produce vigorous plants; and if the pulp, too often wanting in untimely ripened Grapes, is not as essential to maturely-fed seeds as to the piquant taste of each class of Grapes in their season.

I may be venturing too far, perhaps, to question if any Vines forced and steamed, as we are taught, ever furnish fruit at any season of a flavour and substance that can be reported to satisfy the characteristics of the Vines thus treated. But what say our Grape-growers upon a less artificial and more natural course of culture, assisting greatly rather than spurring Nature unnaturally, in reference to the fruit of the Vine, its flavour and season?—READER.

FRENCH NOTES.

As the readers of the Journal have followed me in my wanderings this year, and have been told of the things most notable in a horticultural point of view that have struck me during those wanderings, I would close the account of my rambles with a few notes on what was the only holiday *pur et simple* of the year—my annual visit to Paris and its neighbourhood. In other tours there has been a combination of business and pleasure, but in this it was simply the latter. I could not for many reasons manage it before the end of September, a time when we often have very enjoyable weather; but when the days are short, and to one who is not a theatre-goer, this is a disadvantage in Paris, for, unlike London, there are no other places for spending an evening. However, I managed tolerably well, and, had the weather been a little better during the earlier part of my stay, should have had nothing to complain of. This hindered me, however, from paying a visit to the seed farms of Messrs. Vilmorin & Co., which I was very desirous of doing, but which a very wet day prevented me from. I spent one day, however, in visiting Sceaux, which was holding at that time its horticultural exhibition; and as we have heard a good deal of twaddle lately on exhibiting, and as we are constantly told how much better these things are done in France, I was glad that I had an opportunity of seeing an autumnal show in suburban Paris.

There is no place in the neighbourhood of Paris where an exhibition can be so successfully held, I should think, as at Sceaux. There are the fine fruit nurseries of Jomain and Durand close by, the extensive Rose grounds of Margottin père et fils, the fine nurseries of Thibaut & Keteleer—in fact, nurserymen of all kinds abound here. It was, of course, too late for outdoor flowers, although the very fine autumn had been favourable to the blooming of Roses; still there were some things which one might have expected to see, but I must say in these respects I was miserably disappointed. The Exhibition was held in the park attached to the old chateau of Sceaux, which has passed into the hands of the public and been made a promenade. It was held partly in what is called the "Rotonde," a round building open all round with a canopied roof, in a tent adjoining, and in the open air: this was all in a part divided off from the rest of the park, entered by some fine old avenues of clipped Horse Chestnuts. The Exhibition was open for a week—a miserable mistake, I should think, in every point of view, as the plants and fruits became spoiled, and it was no very edifying sight to see rotten Pears and Apples in every dish of fruit exposed.

And now as to arrangement. I cannot say that there was anything that struck me as worthy of being copied. The Ro-

tonde had a central bed with Cannas, Caladins, and Aralia Sieboldi; and the fruit was arranged on tables that went round the whole circle of the building, and was displayed, as with us, in plates and dishes without the least degree of ornamentation; then bunches of Dahlias, with flowers not one-half the size of those seen with us, were set up in bottles; and Gladioli, the veriest trash, were shown in champagne bottles. But Roses! Ah! here is doubtless something to be gained. Did ever anyone read such a lot of twaddle as has been lately written on the subject of exhibiting the queen of flowers? Well, my old friend Margottin had an arrangement which might perhaps command the consideration of those fastidious gentlemen who are dissatisfied with the present boxes. True, it is cumbersome, would involve taking a truck for oneself and about half a dozen hours to set them up before the show began. But what of that to persons who are wanting a change? It looked pretty, but as to its being natural, why, we won't say anything about that. It consisted of a large framework of zinc about 15 feet long, with six rows of tubes, from which issued, about 6 inches apart, small tube-like sconces into which the Roses were put (see figs. 124 and 125). Placed at the end of the tent it looked pretty enough. Whether it will commend itself to our Rose-growers is another matter. I think I am pretty sure of the reply. Margottin told me that as it was close at home it was possible, otherwise it would not do. There was not a Rose in it above the average merit of our garden flowers. The vegetables were arranged in collections on plates and dishes in

Fig. 124.—Elevation.

Fig. 125.—Front view of one row.

the open air; and as there had been some heavy rain, it was not a very edifying spectacle to see Peas and Kidney Beans floating about in little pools of water. The only really noticeable piece of arrangement was in the entrance, from whence an avenue of trained fruit trees exhibited by Messrs. Jamain and Durand and Messrs. Cronx et fils led up to the Rotonde, the other side being formed of a very poor collection of evergreen shrubs and Conifers. Thus in the much-vaunted arrangements of our neighbours I really saw nothing that we need either envy or imitate. I have ever maintained that it is so. There is sometimes prettiness about them, but of grand and massive grouping there is really nothing. The plants are feeble, and if they have merit it simply arises from the numbers grouped together.

Now with regard to the character of the exhibits. Of flowers there was literally nothing; of stove and greenhouse plants a plentiful scarcity of anything really good; a large collection of Begonias of the tuberous-rooted kinds, but just such as one might pick out of any nursery at the present time. The Dahlias, &c., were simply ridiculous. The fruit, as might be supposed, was very good, but I cannot understand why, after three or four days, there should have been so many specked fruit. Many of these collections were exhibited, not by individuals but by societies, whose members contributed together what made up the display. Thus, in one collection there were 350 sorts of Pears, 75 of Apples, and 45 of Grapes. Amongst the Pears were some fine specimens of *Benrre Diel*, *Triomphe de Jodoigne*, *Benrre Claircean*, *Bergamotte Suisse* (striped), *Duchesse d'Angoulême*, *Bon Chrétien*, *Napoléon*, *Catinka*, *Bon Chrétien d'Espagne*, *Crassane*, *Catillac*, *Uvedale's St. Germain*, *Passe Colmar*, *Doyenné d'Hiver*, &c.; while of Apples, *Emperor Alexander*, *Calville Rouge*, *Reinette Grise*, and *Cal-*

ville Blanche were the most remarkable. As to Grapes I really did not think there was anything worth noting; the bunches were small and the berries also, and the names placed to them were utterly unknown to me.

Neither, then, in arrangement nor in the quality of the articles exhibited do I think that we have anything to learn; and I cannot but say that I felt somewhat pleased, after all that has been said on the subject, to have my often-expressed opinion thus confirmed—that of whatever other things it may be true, it is unquestionably not of horticultural exhibitions, that they do these things better in France.—D., *Deal*.

THE ROYAL HORTICULTURAL SOCIETY'S CHRYSANTHEMUM SHOW.

THE present Council, being amenable to reason and common sense, took the advice of those best acquainted with the growth of this favourite autumn flower, and instead of having their Show so early in the month that none were in flower, fixed it for the 11th; and as the season was a remarkably early one they were rewarded by seeing gathered together the finest collection that ever was collected in the conservatory and arcades in November; and as they had wisely, too, offered some good prizes, there was a spirited competition both amongst nurserymen and amateurs.

There will always be differences of opinion relative to the training of these plants, some preferring those grown on single stems and holding three or four blooms, others those trained on the broad flat system, and others as pyramids. The latter seems to be the most natural, and, as far as my own judgment goes, the six which obtained the first prize amongst amateurs in the Pompon class were the prettiest plants in the Exhibition. Then as to cut blooms, what grand specimens there were there! but how wonderfully dressed! Now, I cannot for the life of me see why, if it is disqualifying to gouge out the eye of a Dahlia, it is pardonable to do the same with the Chrysanthemum. The result was, however, very fine, and finer blooms than some of those exhibited on this occasion were probably never seen.

In Class 1, for twelve plants, there was a very close run between Mr. James and Mr. Cutbush, the former taking first and the latter second. In Mr. James's collection were Prince Alfred, Pink Perfection, Mrs. Halliburton, Jardin des Plantes, Julie Lagravère, Fanst, Empress Eugénie, Golden Eagle, Mrs. George Rundle, Lord Derby, Antonelli, Eve. Mr. Cutbush's plants were Mrs. Sharpe, Annie Salter, Princess Louise of Hesse, Hermine, George Glenny, Mrs. Rundle, Julie Lagravère, Her Majesty, Abbé Passaglia, Prince of Wales, Gloria Mundi, and Christine. In Class 2, for six large-flowered Chrysanthemums, amateurs, the first prize was won by Mr. Hall, gardener to W. Stevens, Esq., Brixton, with fine plants of Golden Nugget, Prince of Wales, Gloria Mundi, Mrs. George Rundle, Lady Harding, and Mr. Gladstone. Mr. Douglas was a capital second with White Venus, Prince of Wales, Her Majesty, Venus, Aurea Multiflora, and Mrs. George Rundle. In Class 3, for twelve Pompons, Mr. Douglas took the first place with beautiful plants of Lilac Cedo Nulli, James Forsyth, Golden Circle, Aurore Boréale, Hélène, Cedo Nulli, St. Michael, President, Golden Cedo Nulli, Madame Martha, Antonius, and Brilliant. Mr. Cutbush had a fine lot of nearly equal merit, comprising Cedo Nulli, Mr. Astie, Mrs. Rundle, Salomon, Brilliant, Andromeda, Madame Martha, Mrs. Hutt, Miss Julia, &c. In Class 4, for six Pompons, amateurs, Mr. Harding, gardener to the Rev. W. Arthur, Clapham Common, was first with beautifully-grown plants of Astræa, Cedo Nulli, Bob, Calliope, Antonius, and Golden Cedo Nulli. Mr. Butcher, gardener to R. A. Glover, Esq., was second with larger but more artificial plants of Andromeda, Calliope, Bob, Cedo Nulli, Antonius, and Golden Cedo Nulli.

Passing by the specimen plants, let us look at the magnificent cut blooms exhibited by Mr. James Cutbush. The flowers were Empress of India, Mr. Howe, Hero of Stoke Newington, Queen of England, Princess Teck, Plenipo, John Salter, Prince of Wales, Lady Slade, Jardin des Plantes, Nil Desperandum, Nonpareil, Cherub, Lady Talfourd, Antonelli, Miss Marechaux, Mrs. Halliburton, Thais, Princess Beatrice, and Isabella Bott. In twelve cut blooms, amateurs, Mr. E. Smith was first with Novelty, Alfred Salter, Golden John Salter, Empress of India, Jardin des Plantes, Mr. Drudees, Princess of Wales, Baron Beust, White Venus, Venus, and Mrs. Heale. In these collections we shall not be far wrong in saying that the very best Chrysanthemums for exhibition purposes are to be found. There are some others, of course, but an exhibitor may well depend on the flowers named for all purposes. There were some fine blooms of these curious but, in my opinion, most effective flowers, the Japanese varieties, Mr. Hannell taking first and Mr. Douglas second. The latter exhibitor's stand contained *Ereeta Superba*, *Fair Maid of Glastonbury*, *Ap. No. Rosea Punctata*, *Garnet*, *Bismarck*, *James Salter*, *Meg Merricks*, *Magnum Bolum*, *Prince Satsuna*, *Bronze Dragon*, and *Grandiflora*. There are other exhibitors of this flower coming in, and

those who wish to add to their collections had better be on the look-out, although very little of novelty, as Mr. Douglas observed in last week's Journal, has been added since our good old friend John Salter had to give up his cultures, those which have been brought forward being only sports of older kinds, and not new seedlings. No flower is more easily grown; but let no one imagine that such blooms as were exhibited at Kensington are to be obtained by the slipshod system of cultivation to which the flower is too often subjected, nor in truth would I for one care to grow them thus. I much prefer a quantity of medium-sized blooms to three or four, or even one large one, on a plant. This will satisfy the many; the exhibitor will "gang his ain gait," and produce these large flowers with which he in truth astonishes the natives, and would most likely astonish the Celestials themselves.—D., *Deal*.

It is many years since an exhibition of this flower has been held in London at all approaching in extent to this, which quite filled the centre of the large conservatory and overflowed into one of the arcades. The collections of plants in pots were the subject of much criticism; the style of training is considered too formal, the method of tying the growths down to produce dwarf specimens being objected to. One or two of the collections were very bare of foliage, which brought into rather prominent notice the sticks and matting used in training—indeed one or two specimens were as nearly dead as possible; and if exhibitors thought they were worth the cost of conveyance to the Show they were certainly not worth carting home again, as they were not adapted for any decorative purpose whatsoever. But this was a very small matter in an Exhibition where there was so much to admire that was really good, and that displayed no small amount of horticultural skill.

First in the schedule was the large-flowered section, divided into classes for nurserymen and amateurs, and some of them being wisely left open, so that amateurs and the trade could enter the lists in friendly combat, the former, as the prize list proclaimed, proving the victors. For twelve specimens Mr. James, gardener to W. F. Watson, Esq., of Isleworth, was first; and this exhibitor does not so much try for large plants as for quality of flowers, and the plants well furnished with healthy deep green foliage. Messrs. J. Cutbush & Son, of Highgate, showed well in this class, as did Mr. J. Herrington, gardener to J. Price, Esq., of Clapham Park. But the best specimens in the Show were exhibited in the next class, which was confined exclusively to amateurs. Those holding the highest position came from Mr. W. Hall, gardener to W. Stevens, Esq., of Brixton; Mr. J. Douglas, gardener to F. Whitbourn, Esq., of Ilford, being placed second, and Mr. James third. The best specimen in the nurserymen's class was a very fine one of George Glenney. Mr. Douglas had a well-flowered specimen of Mrs. G. Rundle, which had the highest award in the amateurs' class.

In the open class for twelve Pompon sorts Mr. Douglas had the first prize, Messrs. Cutbush being second, and Messrs. S. Dixon & Co. of Hackney third. The amateurs' class was exceedingly well filled, but as all the prizetakers' names were published in your advertising columns last week it is not necessary to enumerate them again. A passing remark may be made about the size of the pots in which the plants are grown. At Stoke Newington, Stratford, and other local centres a limit is made, and this has the advantage of causing a uniform growth; exhibitors likewise compete on more equal terms. At Kensington I was told that three plants were potted in one pot in some cases. My own plants were grown with only one in each pot, and so that the stem could be distinctly seen above the soil; the Pommpons in 8½-inch pots and the large-flowered specimens in 11½-inch, except in the case of the large single specimen, which was grown in a 17½-inch pot.

Cut blooms were very numerous and of excellent quality. I do not remember to have seen better specimens than those exhibited by Mr. E. Smith, gardener to T. D. Galpin, Esq., of Putney Heath. Mr. J. H. Hennell, gardener to F. A. Davis, Esq., Surbiton, had also very fine examples, and his first-prize Japanese flowers were the best ever exhibited. Messrs. Veitch, of Chelsea, had some good flowers of both sections, but the best were over before the Show, as, fine though their flowers were, they were not equal to some I saw at Chelsea more than a week previous. The same firm also exhibited some very distinct new varieties; amongst them a hybrid between a large-flowered Anemone and a Japanese; it seems to have some of the Jane Salter blood in it. The disc is rosy lilac, the florets shaped like those of Jane Salter, but pure white; if it is from this variety the colour is in the disc. Altogether it is a very distinct plant, and may be the forerunner of a new class. Gold Thread has a tuit of slender golden-bronze-coloured florets, and is very distinct and attractive. These two and one named Cossack had first-class certificates awarded to them.—J. DOUGLAS.

THE ROYAL BERKS SEED ESTABLISHMENT ANNUAL SOIRÉE.—The annual *soirée* given to the *employés* of Messrs. Sutton

and Sons, seed merchants, Reading, took place on the 9th. This year, owing to the increase in the number of hands, the annual dinner was served-up in one of the spacious seed-stores in the new buildings, which was fitted-up for the occasion, instead of in the Abbey Hall, at five o'clock. An excellent and substantial dinner was partaken of by about 160 *employés*.

EARLY ENGLISH WRITERS ON GARDENING.

No. 1.

THOMAS HILL.

In the sixteenth century a taste for gardening had become so widely diffused among the higher classes of society, that they sought for information concerning its practice. Practical gardeners were totally uneducated, and the only men capable of publishing information were those who would write upon any subject for which the booksellers would pay them. Thomas Hill was one of this tribe, and as he knew nothing of gardening his only resources were the old Greek and Latin authors. These he translated, and unreservedly acknowledged that they were the sources from which he drew his particulars.

Thomas Hill seems to have been born in the year 1543, for his portrait prefixed to his "Pleasant History declaring the whole art of Physiognomy," states it represents him in his

Fig. 126.—Thomas Hill.

twenty-eighth year, and the volume was published in 1571. He is described on the title-pages of his publications "citizen of London" and "Londoner," but whether those designations indicate his birthplace as well as residence I cannot determine. It seems evident that he adhered to the Protestant party, for his first publication is dedicated to Sir Henry Seymour, of Marwell in Hampshire, who was enriched by many grants of conventual lands before his death about 1578; his translation of Coele's work on "Physiognomy" is dedicated to "the Right worshipful Master George Keable, Esquier," another Protestant; and his posthumous work, "The Gardeners' Labyrinth," is dedicated by his friend and editor Henry Dethicke to Cecil, Lord Burghley, Queen Elizabeth's leading statesman.

That Hill was of gentle blood is intimated by his liberal education and by his friendship with such a man as Henry Dethicke, who was the third son of Sir Gilbert Dethicke, principal King at Arms and an antiquary. His brother, Sir William Dethicke, was one of the antiquaries who in 1593 originated a Society that was the seed of our Society of Antiquaries. Henry was a sizar of Gonville Hall, Cambridge. His various promotions are detailed in "Notes and Queries," 2 series, xii., 383. He died in 1613.

Hill's first publication appeared in 1563 in the form of a small duodecimo entitled, "A most briefe and pleasant treatise teachynge how to dress, sowe, and set a Garden." This was enlarged by degrees to the quarto volume, "The profitable Arte of Gardening, to which is added much necessarie matter and a number of secrets, with the Phisicke helps belonging to each hearbe, and that easily prepared. To

this is annexed two proper Treatises, the one entitled *The marvellous government, proprietie, and benefite of Bees, with the rare secretes of the honnie and waxe.* And the other, *The yerely conjectures meete for Husbandmen.* To these is likewise added a Treatise on the *Arte of Graffing and Planting of Trees.*" The first edition of this was published in 1568, and how acceptable it was, and ministered to the growing taste for gardening, is shown by other editions appearing in 1571, 1579, 1586, 1593, and 1608, of which copies are in the library of the British Museum. The edition of 1586 is the last which appeared in Hill's lifetime; for we learn from Dethicke's dedication of "*The Gardeners' Labyrinth,*" published in 1591, that its author, his friend, was "lately entered."

Although all that Hill published relative to gardening are confessedly translations of the Greek and Latin writers, yet

there are mingled with them notes of what he saw and heard of the gardening of the years in which he lived. Some of these notes are here republished, but they will be as he published them, without any system, for the gardens in his days combined the kitchen, flower, and physic departments.

Mazes were then thought clever inventions, and he gives three plans of them. "One of them, which liketh them best, may be in that voyd place of the garden that may best be spared for the onely purpose to sport them in at times."

Lavender "at this day growing in most gardens, is occupied in baths and in the washing of hands, for the sweetnes of smel, therefore of most men named the Lavender," implying that it was derived from to lave or wash.

The "Lillie of the Valley is a flour mervalous sweete—now

Fig. 127.

for the great commoditie and use known of the floure of late yeares is brought and planted in gardens."

Radishes were then, as now, a popular vegetable "well known both unto the rich and poore, so that as well the husbandmen as the eittizens doe at this day eate of the Radish, the same before being well scraped, cut into thin round slices, and dipped in water and salt."

I have spoken of "*The Gardeners' Labyrinth*" as one of Hill's publications; and it is so, for although on its title-page the author is named "Dydymus Mountain," I pointed out some years since in "*Notes and Queries*" that Didymus is a synonym of Thomas, and Mountain an exaggeration of Hill. However, all doubt upon this is removed by Hill's contemporary Edmund Southerne, who states in his book on bees, published in 1595, "*Thomas Hill of London*" was author of "*The Gardeners' Labyrinth.*" This is only an amplification of "*The Arte of Gardening.*"

It contains more woodcuts of the flower-knots, rude precedents of our bedding-out; the construction of arbours, then called "herbers;" the arrangement of beds and modes of watering. One woodcut showing their water-syringing so illustrates the whole that we have had it copied (see fig. 127).

It does not show that our garden implements were then much improved either in workmanship or by new inventions,

except that watering engine; but all the Roman implements were introduced into England during its four-hundred-years occupation, and we have drawings of many in the Anglo-Saxon MSS. Scarcely one of the chief implements we now use were unknown to them. Baskets made of osiers; bills, "crooked hatchets;" pruning books and pickaxes; brooms made of twigs; flower pots of earthenware; knives with crooked blades for pruning; rakes, the Roman had but four teeth, but the Anglo-Saxon was like that now used in haymaking; saws; scythes, but the stale was straight and without handles; apades with demi-oval blades, and an iron above to put the foot on when digging, and these were the same when the annexed cut was drawn; hoes, and one combined with a rake. Watering pots seem to have been employed by the Greeks, but we do not remember any notice of them by Roman writers. One of the earliest mentions of them is by Shakespeare, who puts the phrase into Lear's mouth, "To use his eyes like garden water-pots for laying autumn's dust." Wheelbarrows also appear to have been unused by them.

Contrary to modern usage, then "the Beete was more often eaten at poore men's tables;" and Endive was blanched by binding the leaves together "with a browne thread and covering them after with a pot of earth."

I might quote many more instances of the gardening of three

hundred years ago, but have referred to a sufficiency to show the early commencements of our modern practices.—G.

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

PASSIFLORA (TACSONIA) MANICATA. *Nat. ord., Passifloraceæ. Linn., Monadelphia Pentandria.*—Flowers scarlet. "This lovely plant has been for many years cultivated in England, though not so extensively as it deserves, having had the reputation of not flowering freely. It was introduced previous to 1850 by the Horticultural Society, through its collector Hartweg, who found it in hedges near Loja in Peru, where, indeed, it was discovered by Humboldt and Bonpland half a century previously. It is also a native of the Andes of Ecuador and New Grenada, where it was found by Purdie on the arid plains of Suta Marchan, and is there called Ruruba de Senene. A similar undescribed species, or perhaps a variety of this, with white flowers, was gathered by Pearce at Puquina (in Peru?), at an elevation of 10,000 feet."—(*Bot. Mag.*, t. 6129.)

CERINTE GYMNANDRA. *Nat. ord., Borraginæe. Linn., Pentandria Monogynia.*—Flowers yellow and purple. "A very rare European plant, hitherto found, as far as I am aware, only near Naples, whence I have seen specimens collected by Heldreich; it is, however, common in some parts of Western Algeria, as at Oran and Elidah, growing in sandy places, and in Morocco. Though hardly different from *C. major* (Tab. nost. 333), as pointed out by Wilkemm and Lange, it is a very beautiful form of the genus, well worthy of cultivation, but unfortunately annual. One of its most striking characters is the discoloration of the tips of the leaves; these in all our specimens are of a fine pale glaucous blue, except at the very end, which is pale greenish-yellow, bounded towards the midrib by a dull dark purple band; thus the colouring of the leaf-tip is a repetition of that of the flower, and gives a bright appearance to the whole plant. From the above-quoted figure of *Cerinte* the major in this Magazine, the present differs in the yellow tubular terminal portion of the corolla, the narrower sepals not cordate at the base, and foliage. But little dependance can be placed on these characteristics in so variable a genus.

"Our specimens were raised from seed sent by Messrs. Haage and Schmidt, and flowered in July."—(*Ibid.*, t. 6130.)

MELALEUCA WILSONI. *Nat. ord., Myrtaceæ. Linn., Polyadelphia Polyandria.*—Stamens deep lilac. "This is one of that large class of hardwooded Australian plants which, if properly cultivated, would ornament our conservatories and greenhouses at seasons when little else worth looking at meets the eye, but which have almost throughout the country succumbed to the treatment they have received—namely, of watering in season and out of season. The genus to which it belongs contains just one hundred species, scattered over all parts of Australia, amongst which are some of the most brilliant-coloured plants of that gay Flora. The present is essentially a dry-country species, inhabiting the desert of the Tattave country, Port Lincoln, &c., in South Australia, as also the country around Lake Hindmarsh in the colony of Victoria. It was raised at Kew from seeds sent by Baron Muller from the Melbourne Botanic Garden, when he was director of that rich botanical establishment; and was named by him after Mr. Charles Wilson, through whose aid, he states, this very beautiful species was discovered."—(*Ibid.*, t. 6131.)

IRIS LÆVIGATA. *Nat. ord., Iridaceæ. Linn., Triandria Monogynia.*—Flowers deep reddish purple. "This beautiful hardy plant is likely to become as great a favourite in England as it is said to be in Japan. It was originally introduced by Von Siebold from Japan, and flowered in Verschaffelt's establishment at Ghent in 1857, when a very pale variety of it was figured by Lemaire in the 'Illustration Horticole.' As it there appeared under the name of *I. Kempteri* of Siebold, I suppose that this latter author identified it with the *Sziti* or *Itz falz* of Kämpfer (Amen. Exot., p. 873), a plant which Kämpfer describes as an Iris with large double flowers, and which flowers during many days. Hasskarl (Miquel Protus., p. 306), says that it is the *Itsi Katsi* of the Japanese. Whatever may be its Japanese name or the history of that of Kämpfer, it was no doubt first long previously described from Eastern Asiatic specimens by Fischer as *I. lævigata*. It is a native of East Siberia from the Baikal and Dahuria to Kantschatka, the Amur district, and Korea, and it thence extends to the northern parts of Japan."—(*Ibid.*, t. 6132.)

POLYGONATUM VULGARE var. MACRANTHUM. *Nat. ord., Smilacæe. Linn., Hexandria Monogynia.*—Flowers white, tipped with green. Native of Japan. "The size of the flower is perhaps the most noticeable feature of the plant here figured, though in that it is rivalled by both European and North Asiatic specimens; the inflation of the corolla above its middle and its slight contraction at the throat are other characters, which, however, disappear as the corolla withers and its lobes connive. Decaisne and Morren observe that the style exceeds the stamens in their *P. japonicum*, which is no doubt a sexual difference. In the form of its foliage it agrees best with the North America *P. commutatum*, Dietr. and Otto, which has a terete stem. Lastly, having regard to the variability of the alternate-leaved *Polygonatums*, it would not surprise me to find that all were referable to two, the *P. vulgare* with a grooved stem, and *P. multiflorum* with terete stem.

"The subject of the present plate has long been cultivated at Kew under the name of *P. japonicum*, and it flowers in April."—(*Ibid.*, t. 6133.)

BLUMENBACHIA (CALUDORA) CONTORTA. *Nat. ord., Legum. Linn., Polyadelphia Polyandria.*—Flowers scarlet. "It is a climber, native of Peru and Ecuador, where it ascends to an elevation of 12,000 feet; should it prove as hardy as the charming *B. lateritia* (*Loasa lateritia*), it will be a very ornamental wall plant in most parts of England. It is probably, like that plant, a biennial. It was raised from Peruvian seeds by Messrs. Veitch, and flowered in their grounds in July of the present year."—(*Ibid.*, t. 6131.)

LILIUM WASHINGTONIANUM PURPUREUM "is a beautifully tinted variety of *L. Washingtonianum*, described as being smaller in stature and more slender in habit, with a stem of 1 foot to 1½ foot high, furnished with oblanceolate leaves from 1 inch to 1½ inch long, and crowned by a raceme of from four to eight or more very handsome flowers. The perianth is bell-funnel-shaped, with the segments very much reflexed, white stained (more deeply in the older flowers) with wine-purple, and dotted all over with minute spots of blackish-purple. It also flowers in July.

"The introduction of this variety is due to Mr. W. Bull, by whom it was imported, and distributed in some quantity at Stevens' Auction Rooms in the latter part of last year, under the name of *L. purpureum*, which was attached to it in accordance with the descriptions received from California, where it is found in the Yosemite Valley. Mr. Bull observes that he has never found *L. Washingtonianum* to bloom in the precocious way that this variety does; the bulbs, moreover, are different. Another distinction is, that *L. Washingtonianum* grows 6000 feet above the level of the sea, where the ground is covered in winter with from 15 feet to 20 feet of snow; whereas *L. Washingtonianum purpureum* is found in Humboldt county, in a climate of perpetual spring. The flowers are fragrant, and from twelve to sixteen are produced on a stem."—(*Florist and Pomologist*, 3 s., vii., 256.)

LITTLE TROT SILVER-EDGED BEDDING GERANIUM.

THE season of summer-flowering and fine-foliaged bedding plants being over for the year, let us take a retrospect and compare those which have tended to embellish our flower beds with others that were similarly used a dozen or twenty years ago, and we shall find that a great change has taken place. Into the causes of this change as well as its effects it is not my present purpose to enter, my object being to call attention to one class of plants that came into use as soon as the mass-bedding system in its present form started into existence; and here I may observe that it is perhaps more popular now than it ever has been, and taking it in all its bearings it is not likely to go out of fashion. The plant to which I especially refer is the Geranium or Pelargonium, on which latter name some fastidiously insist, but by the plain practical man the term bedding Geranium is sufficiently well understood. We need not go far back into the history of the bedding Geranium to find out what great improvements have been effected in its varieties, and yet new ones keep flowing in, and some of these, it must be acknowledged, present but little if any improvement on older ones. Occasionally, however, old varieties that have been discarded have been restored to favour, and enjoyed a higher reputation than before. Nevertheless, it must be admitted that great improvement has been made, and the choicest kinds that could have been brought

together twenty years ago could not compete with those we now have. This remark may appear superfluous, but if we turn to the *Dahlia* I imagine the best stands exhibited twenty years ago would quite equal those of the present time.

New kinds and new features in the *Geranium* have been strongly advocated, and to some extent secured, whilst in some other cases there has been a decline, as with those belonging to the class of which Mrs. Pollock may be regarded as the type, which are less patronised than before, owing to some of the best-marked sorts being only shy growers. A more robust class, the Gold and Bronze, have been more extensively grown. There is, however, one more class to which I intend more especially to call attention, and that is the Silver-edged section as it is called. From the first I have always regarded the White or Silver-edged class as more important in the general parterre than the Golden one; for in the distance, when surrounded by greenery, it looks better, and especially as compared to the many-coloured varieties, of which Lady Cullum, Lucy Grieve, and others were at one time the cream. This remark, of course, is meant to apply where plants have to be looked at from a distance, or where in conjunction with green foliage of other kinds.

But it is not necessary here to urge the claims of one class against another, rather let us see what has been done in the Silver-edged section; and here it must be confessed the improvement for a great many years has been very small indeed, for it is not unusual now to meet with one of the very oldest class, Flower of the Day, which has borne the test of fully a quarter of a century, and is still admired by many. Others, however, insist on one having a clearer white margin—that of Flower of the Day being a soft creamy white; while some also want bright scarlet flowers, and these, too, of fair size. All requirements have not been supplied by any great number of varieties, and it is not unusual to see in a garden, which boasts of its hundreds of flowering *Geraniums*, only one Silver-edged variety, and this often so much neglected as not to be dignified with any other name than the Silver-edged one. Fortunately, however, for the guidance of those who have not the means of growing many kinds, and also to afford the public the benefit of the judgment on the merits of new kinds of those best qualified to give it, the Royal Horticultural Society has for some years been in the habit of planting-out in their own garden all the varieties sent to them for trial, and these being all grown under the same conditions, and their merits or failings duly chronicled, the report on them is of great value to those who grow the *Geranium*. The commendations are by no means scattered broadcast, but sometimes a certificate of merit is awarded to a choice variety in its section, as was the case the present season to one that I have had the opportunity of seeing in a growing condition for two or three years. It is of the Silver-edged section, and was, I believe, named Little Trot by Mr. Davis, its successful raiser. Mr. Davis has the management of the grounds of the Maidstone Cemetery, which he has embellished in a manner that far excels anything of the kind I have ever met with elsewhere, and he has for years been in the habit of raising hundreds of seedling *Geraniums*, and amongst them was Little Trot. This, from its compact habit, its neat foliage of a uniform size, and rather less than in the generality of such kinds, added to the clearness of the white of its margin, was admired by all who saw it, and Mr. Davis was advised to subject it to the test of the Horticultural Society, and it has been awarded a certificate of merit. I have no doubt it will become a favourite with all by whom it may be grown, as it seems well adapted to fill those spaces in panel beds that require a Silver-edged *Geranium* of neat but not stunted growth. It is a well-branched kind; the branches are of horizontal rather than upright growth, and the foliage nicely spread over the whole rather than collected in a tuft, as was the case with a dwarf kind fashionable some years ago, and which, by-the-by, looked badly when wet weather set in, as much of the foliage decayed; but Little Trot rain seems only to make brighter, and to show it to better advantage. It is certainly an advance on all the dwarf Silver-edged *Geraniums* I have hitherto met with, and for lines of edging, panel work, or any other purpose where a medium dwarf growth is required it will be found to be just what was wanted.

By those to whom the difficulties of raising seedling *Geraniums* seem beyond their means, the way that Mr. Davis accomplishes the object is well worth copying, for with the aid of very little glass he sows the seeds in a slightly-prepared hot-bed in March. He thinks it is not so well to sow sooner, and

when the plants will bear handling he pricks them out into a nursery bed sheltered and sunny, and the largest of them are afterwards transplanted upon rather poor ground, when many of them will be found to flower in September. Those which do not and show no signs of bloom have their heads taken off as a cutting, and the old plant left to perish (if it be not an ornamental-foliaged one), and the cutting with other strong ones is retained for another year. Mr. Davis gets many to flower the first year, and by his superior way of managing them asserts that there is no more difficulty in raising seedling *Geraniums* than there is in Lettuce, and most of his flowering plants are of his own raising, and possibly his stock may turn out another Little Trot in some other form, for he has plenty of good seedlings.—J. ROBSON.

NOTES AND GLEANINGS.

IN the notice of the LINDLEY MEDAL which we gave last week, a printer's error occurred, by saying that the portrait of Dr. Lindley was "enamelled" with a Laurel wreath instead of "encircled" with a Laurel wreath.

— We regret to hear that Mr. JAMES SMITH, late of Exton Park, Rutlandshire, is leaving the management of the gardens of Lord Dartmouth at Patshull, Wolverhampton. Mr. Smith had only recently entered on the situation, but he finds it not in accordance with his expectations, and hence he has sent in his resignation. Any nobleman or gentleman wishing the services of a highly experienced gardener of the greatest integrity will find in Mr. Smith such an one as they desire.

— A REMARKABLY rapid-growing tree is a variety of the Cottonwood (*Populus canadensis*), and in Messrs. Waterer's nurseries at Knap Hill it has grown 20 feet in three years.

KNEBWORTH PARK,

THE SEAT OF LORD LYTTON.

To every student of English literature the name of the late Lord Lytton is familiar. Few there are who have not read the charming productions of his pen; and though he has passed away, he has made for himself an enduring name apart from all inherited or bestowed. But though his works have been read by myriads, yet, except by those who live in the immediate neighbourhood of his ancestral home, those who have seen his residence and its gardens may be counted only by hundreds. He was a man of taste, and hence it might be expected he would by no means neglect his garden; and though in size and appliances it has no pretension to rival our great establishments, it is, nevertheless, one of the prettiest gardens we know.

Knebworth Park is three miles from Stevenage station on the Great Northern Railway, and covers about three hundred acres of nearly the highest ground in the county of Herts. In Anglo-Saxon times the manor was part of the vast domains of Eudo Dapifer, but in the time of Henry II. it was in the tenure of one of the De Ous, who probably was an ancestor of Robert de Hoo, who was Lord of the Manor in Edward I.'s time. By marriage it passed into the possession of various families until Sir Thomas Bouchier, in the seventh year of Henry VII., sold it to Sir Robert Lytton, and it has continued in the possession of his descendants. The ancient manor house was pulled down in 1811, and the present mansion erected on nearly the same site. Of the west or garden front of this, the accompanying engraving (*fig. 128*), from a photograph by Mr. A. Elsdon, of North Crescent, Hertford, is an accurate representation, and owing to the elevation of the site the tower, which forms a prominent feature in the architectural design, commands the view of a wide range of the surrounding country. Extended before it is a flower garden on grass, the beds framed in gravel, plentifully embellished with vases and statuary, and covering altogether about four acres. The design is somewhat complicated, and from its character difficult to plant so as to combine harmony of colour with variety, while the number of plants required, some 36,000, is large for the means of producing them. The effect, however, as will be seen from *fig. 129*, also from a photograph taken by Mr. Elsdon, is excellent; and though at the time of our visit the glory of the flower beds had departed, enough of their beauty was left to show what it had been when they were in their pride. The lawn surrounding the beds is beautifully kept, and extends on both sides of the broad central walk to the high Laurel hedges which form the boundary of this garden.

It is dotted with some fine Araucarias, Wellingtonias, Cryptomerias, and other Conifers. Some of the Araucarias after the dry summer of 1866 appeared to be dying, but Mr. Kipling, the gardener, gave them a good mulching of loam, leaf soil, and a little well-decayed manure, and they improved wonderfully. The Ivy-covered summer-house on the mound on the south-west side, and which forms a conspicuous object in *fig. 129*, commands a good view of the flower garden and mansion, and, in a clear day, of the surrounding country.

At Knebworth we have not one but many gardens to deal with; some of them are very charming, though none very large. Thus we have the bowling-green, another Laurel enclosure of smooth lawn, such as that half-forgotten game requires, and in a sheltered secluded spot a hardy fernery. From this, looking through an oval opening in a trellis-

work, a view is gained of a Heath garden, most noticeable in which are clumps of the Mediterranean Heath; and passing from this into the adjoining garden, in which is a small temple, we again find lawn surrounded by evergreens and studded with shrubs, and notably the Golden Arbor-Vitæ, of which there are several handsome specimens. Here we gain—chiefly through peepholes, which to our taste are somewhat too artificial, and certainly so in their present state—views of the park with its scattered Oaks, its clumps of Elms, its old Horse Chestnut and young Lime tree avenues, and its woodland masses of Oaks stretching far into the distance. Next comes an old-fashioned Box garden with polychrome walks, which is a deal of trouble, and—but tastes differ—of no great effect. It is quaint but not old enough to strike one as a relic of the olden times, and owing to the failure of the coloured

Fig. 128.—KNEBWORTH.

materials which are employed, as in the case of spar and broken bricks, &c., wherever used in superseding Nature's inimitable tints, it may be questioned whether these would not be much more advantageously and pleasurably substituted, especially in a case where no great antiquity can be claimed. Through the Laurel-surrounding of this garden in an eastward direction is seen the tower of the mansion at the end of a long vista. In an adjoining garden are a number of fine common Laurels of large size clipped into a circular haystack shape, with handsome low standards of the Portugal by the side of the walk. Ivy baskets and marble busts are also freely introduced, the latter among Yews. Into an adjoining maze we did not enter.

On the south-west side of the mansion, and entirely shut out from every other part, is what is called Horace's Garden, intended to represent that of a small Roman villa. It is plentifully adorned with busts, as of Augustus Cæsar, Horace, Virgil, and other classical celebrities; but the Italian Vines have had to be substituted by Hops on the rustic poles on one side of the very poor piece of water running through it. The whole of this somewhat limited area is surrounded by Spruce, Scotch Firs, and Oaks; and as an ideal of what has long since ceased to be, notwithstanding some vegetable anachronisms, is a pleasing-enough spot, and would be all the more so were the water to rival in purity that of the fountain which Horace so lauded.

An old flower garden has been turned into a rosery, in which it is contemplated to carry pillar Roses on arches over the surrounding walks. A good deal, however, will have to be done by the gardener, for near here the chalk crops out to the surface, and Rhododendrons and other chalk-abhorring subjects cannot long survive unless provided with peat. Portugal Laurels, of which there are some nice dwarf standards, seem to do well.

The kitchen garden is by no means neglected, but sadly needs remodelling. The glass houses are too few for a place of such size, and most of them must ere long be replaced; still in such as there are we noticed good Muscat and Hamburgh Grapes, and we believe Strawberries are forced in considerable numbers. Considerable extension of the glass and a rearrangement of the two kitchen gardens would add much to the resources of the place, but to keep twelve or thirteen acres of flower garden and pleasure grounds, and two acres of kitchen garden, in the order in which Mr. Kipling does, with the means at his command, must be no easy task.

NOTES ON VILLA AND SUBURBAN GARDENING.

FLOWER GARDEN.

THE recent frosts have rendered it quite necessary to clear the beds of their summer occupants; and, in fact, the whole garden must be at once gone over. In the first place, if previous

a lvice has been acted upon, all plants which will be wanted again have been put under protection. The last to be secured are the Dahlias, Marvel of Peru, and Echeveria secunda glauca, a plant perhaps more generally used for edgings for flower gardens than any other; but it is not quite hardy, and should therefore be put in a place of safety at once. This need not be under glass, but simply under a wall or in any other sheltered spot. Last winter, which was a very mild one, many of my plants had no protection; but the season before that, and also at the present time, I dug out a trench 4 feet wide and 1 foot in depth, and laid 3 or 4 inches of sandy soil at the bottom. The plants were taken from the garden, put in thickly, and covered with hoops and mats at night; and if the weather proved severe the usual protection of rough fern was thrown on. Unless it froze the whole day they were always uncovered, if only for an hour or two. Dahlias and other similar-rooted things of the same degree

of tenderness were taken up and placed in a cool dry shed, with their roots covered in dry earth.

Take up bulbs of *Gladiolus* if not already done. The commonest sorts, such as *Brenchleyensis*, may have their bulbs packed in sand or dry earth; and other sorts, such as the choice named ones, should be wrapped in paper with the names attached, and placed in the storeroom. Clear every bed and border; dress the surface of the ground, and mark out all vacant places, so that other subjects may be planted for spring-blooming without delay.

Carnations in frames must be made secure from frost, and in mild weather, or even when the thermometer is a few degrees above the freezing point, give air freely; and when watering the plants do it carefully, so as not to wet the foliage. Take care also that the roots do not run through the bottom of the pot and take hold of the soil.

Fig. 129.—THE FLOWER GARDEN AT KNEEWORTH.

Cinerarias that are to bloom in small pots should have the side shoots picked off. If one flower stem only is left, and that the centre or largest one, it will produce a very fine head of bloom, and be more satisfactory than if there were more of them.

GREENHOUSE AND CONSERVATORY.

Fuchsias done blooming should have their most straggling shoots shortened, and be gradually dried-off. Achimenes of sorts should also be stowed away, but neither these nor Fuchsias will need any water for three weeks, and if on a damp bottom not for six weeks, or even longer. *Solanum Capsicastrum* will now be very pretty with its scarlet berries, and should be set in the most conspicuous places. *Chrysanthemum*, too, must not have any water dashed over their flowers, for this will cause them to rot. *Primulas*, the forwardest of which will now be coming into flower, must stand where they can dry themselves freely after being watered: it is the stagnation of water about their necks which causes so many of them to damp-off. *Adiantum* and *Lycopoda*, as well as many other of the tenderest greenhouse plants, must be placed in the warmest end of the house; and slugs, which are exceedingly fond of the young fronds, must be regularly looked after. They will be best found at night, as they will then be at their work of destruction. Heaths of the *hyemalis* type, as well as *autumnalis* and others, will now be coming into bloom, and must be placed where there is a free circulation of air; a want of this provision often brings mildew, which is so destructive to this class of plants and so very difficult to get rid of. *Pelargoniums* will also need careful tending to guard against damp. There is a disease which appears on

the leaf called the *spot*; to prevent this they must have a dry foliage when the sun shines on them. These and the *Cinerarias* will need frequently fumigating with tobacco paper, but always when the foliage is dry—a rule which should be observed on all plants that have to undergo this process. *Lachenalias* of sorts which are started well into growth should be brought near the glass; and the same may be said of *Cyclamens*, which are now advancing, and must have air freely, but at no time a close damp atmosphere.

Gesnera zebrina and others are all handsome-foliaged plants. If they do not flower in a cool greenhouse their foliage makes them attractive objects on the dinner table as well as for general decoration; but in a warm house, not a stove heat, they may be expected to flower fairly.

Some of the early *Hyacinths* potted some time ago will no doubt be making a growth, if allowed to remain under the covering much longer they will become injured; so with early *Tulips*: therefore take all such out, place them either in a frame or under a stage out of the full light for the present, and cover them over in the daytime with pots of the same size, taking these off at night. After a few days, when it is seen that the growth is gradually becoming green, the pots may be left off altogether.

The variegated section of *Pelargoniums*, which includes gold and silver-variegated, the bronze section, the gold-leaved, as well as the ordinary variegated sorts—if any of these are in frames they should be moved to drier quarters, if possible in the greenhouse, so that their foliage may keep good, which it seldom does throughout the winter in damp cold frames. These, with

the old plants of Mrs. Pollock, may be preserved two, three, or even four in a pot of dry earth when only required for bedding; but if needed for specimens for pot-culture they must have a little more than the ordinary care bestowed upon them.—THOMAS RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN GARDEN.

THE weather up to the middle of last week had been very mild, which caused the fruit-buds on all trees to grow or plump-up rather more than usual; indeed, in mild weather all through the winter months, Apple, Pear, Cherry, Plum, and other fruit trees are making progressive movement. On Wednesday, the 11th, the thermometer registered 5° of frost, and on the evening of Wednesday a stiff north-easter sprung up, with a few degrees of frost and a dry bracing atmosphere, which continues as we write. Of course as the alleys were quite hard, wheeling manure and trenching were the order of the day. We had been cutting the lawn early in the week, and up to that time had been regularly cutting it. Some portions of our kitchen garden had been made up at different times, and has therefore sunk in places. An opportunity has been taken to fill these up with soil excavated to enlarge a Vine border.

Celery in our light soil is extremely liable to decay at the heart; but it would almost seem to be the atmospheric conditions which have most to do with it. As earthing-up with some other material does not make very much difference to us, cocoa-turf fibre refuse was tried fresh from the works, and in this clean material, which had been found to answer in other places, the result was even more unsatisfactory. A plan has been tried by which a cord has been fixed above the row, raised, say, a foot above the top of the ridge, some good wheat straw is placed over it and bent at the middle, so that a light thatch is made; elevated as it is above the ground by the cord, very little rain can get to the centre of the plants.

We will, if possible, have the *Raspberry* plants pruned, and the ground between the rows dug with a steel fork this month. The plants are trained in two ways, but preference must be given to that by which the canes can be tied to a wire fixed in a horizontal position about 3 feet above the surface of the ground. When this method of training is adopted the plants are in rows 18 inches apart, or for the strongest-growing sorts 2 feet are allowed; the canes are then tied to the wire, allowing about 6 inches between each cane. The rows must be not less than 4 feet apart to allow of the fruit being gathered readily, and no advantage would be gained if the rows were closer, as sun and air would not be freely admitted to them. Fresh plantations may be made now.

If *Carrots*, *Beet*, *Parsnips*, *Salsafy*, *Scorzonera*, and other roots have not been stored, no time should be lost now if frost will permit of its being done. Many persons have had their roots stored weeks ago, but nothing is gained by storing them very early, as the quality does not improve after the roots are taken out of the ground; indeed, in the case of *Parsnips* we would not take them out of the ground at all, but when hard frosts set in it is troublesome to get at them, and altogether it is most convenient when all are packed together in sand in a cool shed. The person who has to cater for the kitchen supply of vegetables will always approve of this arrangement.

VINERIES.

It was stated in a contemporary two years or more ago of some Grapes which were cut with the branch, the end of this inserted in a bottle of water in the usual way, and the whole placed in a fruit-room in the manner so frequently practised within the last few years, that during a severe frost the Grapes were frozen, and even the water in the bottles had ice upon it, and yet the fruit kept good for some time after—in fact, all the better, it was said, for the freezing. Now that is contrary to all the experience we have had with Grapes in the vineries. If the thermometer falls to the freezing-point the fruit decays more rapidly afterwards. It is therefore our endeavour to keep the temperature up to 40° at night at present, removing all decaying leaves and mouldy berries; the moisture evaporating from leaves in the process of decay tends more to spoil the appearance of the bunches than the atmospheric conditions existing outside, bad as these are in the neighbourhood of London, Manchester, and other large cities. With care fogs may be guarded against, but a little forethought is necessary. It is no use getting-up a brisk fire in the morning and opening the ventilators when King Fog holds sway. If any ventilators are open the damp air will get in, and will continue to pour in while the fog lasts. The best way is to keep doors, windows, and ventilators closed, and only sufficient heat in the hot-water pipes to maintain a proper temperature in the house.

We have not yet started the early vinery, but those who have must not maintain a high temperature at night; they should shut-up early in the afternoon, and allow the pipes to become just milk warm, unless it is a sharp frost, when the heating apparatus must be warmed more, but not so as to have the house up to a certain temperature at all hazards.

In previous numbers we have recommended the use of some fermenting material in vineries. In country gardens at this season fallen leaves can be obtained in quantity, and if a good bed of them can be made-up in the house they throw off a sweet heat and sufficient moisture. Our own system is to save the droppings from the stables, wheel-in a barrowload every alternate morning, and this fresh material is mixed with that which has become sweet by frequent turning, so that little danger arises from an excess of rank steam. When preparing the Vines for forcing at this early season the rods should be bent down, so that the ends of the canes may be brought near the front sashes. Unless this is done the buds nearest the top would start first, and those at or near the base would start weakly.

FLOWER GARDEN AND SHRUBBERY.

We have run the mower over the lawn, we trust for the last time this season. All the edgings were neatly clipped. The beds intended to be planted with spring flowers should be filled with them as soon as possible if it is not already done, and beds not planted ought to be dug up, forked over, or neatly raked. Shrubberies may have the open spaces planted with bulbs or flowering plants. Some of the different species of *Lilies* are well adapted for this purpose, and nothing thrives better than the different species of *Convallaria*. *C. Polygonatum*, or, as it is popularly called, Solomon's Seal, grows more freely in certain positions amongst shrubs than it does when more freely exposed. How sweet also is the *Lily of the Valley* for such purposes! *Phloxes* do well if not shaded too much, but the ground for such gross feeders must be rich, and the plants should be renewed every second year. Another plant that is not seen so often in prominent positions in such places is the *Tree Paeony* (*Paeonia arborea*). There are now scores if not hundreds of distinct varieties, and the different shades of colour in the noble flowers, from delicate rose to deep red, are set off to great advantage by the deep green of the background. A few of the best sorts should be cultivated in all gardens.—J. DOUGLAS.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

[SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held. Although we cannot report them fully, we shall readily note anything especially excellent, and we wish for information on such specialities to be sent to us.]

	NOVEMBER.	DECEMBER.
Cheltenham (Chrysanth.)	23 and 24	Birmingham (Chrysanthemum)
Royal Hort. Society of Ireland	26	1 and 2
	DECEMBER.	York
Manchester	1 and 2	1, 2, and 3

TO CORRESPONDENTS.

* * All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

SUPPLEMENT (*A Young Subscriber*).—You did not count the number of pages in each—there are four supplemental.

RASPBERRY PLANTING (*F. E. R.*).—You may plant now and until early in February. The following are superior:—Carter's Prolific, red; Fastolf, purplish red; October Red, Sweet Yellow Antwerp, and October Yellow.

GUERNSEY LILIES (*G. D.*).—The bulbs can be purchased of any of the florists who advertise in our columns.

GRAPES SCALDING (*B. G.*).—We think what you so name must be the "spot." If so, watering the roots with tepid very weak liquid manure during the growing season would probably remove the evil. If you sent us two or three berries in a box we could be sure of the disease required to be avoided.

SPIT MANURE (*Dan*).—Any thoroughly-decomposed manure that can be dug with the spade is so designated.

POTATOES.—"I have grown Sutton's Hundredfold Fluke this season, and for table use find them white, mealy, and of good flavour. The circumstances under which "D. W. W." has grown or cooked them may have had a great deal to do with the waxy condition.—J. KNOWLES, *Blackburn*."

"I am of the same opinion as your correspondent, "D. W. W.," respecting the Hundredfold Fluke. Mine are waxy and rather strong to the taste, though my soil is excellent for Potato-growing. It is a good cropper, also of a good shape. I intend giving it another trial next year, and am inclined to think they will be better if kept a while longer.—M. B."

REPLACING VINES—BORDER FOR VINES (*B. E.*).—The Lady Downe's which you wish to remove and replace with Black Hamburgs would be best cleared away, the soil renewed, and young canes planted between the present time and your commencing to start the Vines. We should do this as soon as possible. The Vines will not do any good with their roots under the paved floor, and as you cannot have a border outside without grassing it we should prefer the latter. The border should be 3 feet deep, well drained, and consist

of turfy loam, about a sixth part of old mortar rubbish, and a tenth of half-inch bones, well incorporated. It would be well if you could raise the border and form it into a terrace, especially if the soil is wet. Plant early in March, but we should form the border at once. If the loam is poor it may have a fourth of well-rotted manure added to it.

WINTERING PLANTS IN A FRAME BLUE-HEATED (G. P.).—It will not answer to fill-in against the sides of the frame, as that would deprive you of the heat from the sides, but they should be kept clear, and you may have a wooden stage for the plants, a lattice stage being best. Flags or slates answer well, but sheet iron, unless galvanised, is soon corroded, and is, besides, costly and unsuitable. The supports for the stage ought not to rest on the due, but be clear of it to prevent fire in case of overheating.

PAMPAS GRASS—ALPINES FOR ROCKERY (Agapanthus).—Pampas Grass would not succeed in a border shaded by trees and exhausted of its moisture by their roots; but if the trees do not injuriously affect the border in the above way you may plant with a fair chance of success; they are best planted in spring before growth commences. As Ferns and Ivy grow well, it is evident they, and not subjects which require sun, are most suitable. A few Alpines for the rockery are *Alyssum saxatile* compactum, *Antyllis emacina* (pale blue), *Arabis alba*, *Anubria Campbelli* (blue), *A. deltoidea grandiflora* (blue), *Campanula garzatica* (bluish purple), *Cheiranthus longifolius*, *Cistus argenteus*, *Cyclamen coum*, *Dianthus neglectus*, *Draba aizoides*, *Erysimum pumilum*, *Globularia nana* (pale purple), *Phlox Nelsoni*, *Santolina alpina*, *Saxifraga affinis*, *S. ceratophylla*, *S. granulata*, *S. longiflora vera*, *S. palmata*, *Sedums acre*, *cyaneum* (purplish blue), *Strepurpurnum*, *glaucom*, *pallidum roseum*; *Sempervivum arachnoideum*, *S. californicum*, *Silene pumilio*, *Statice alpina*, and *Veronica prostrata* (blue).

POTATOES AND RADISHES IN A PIT (P. S.).—You do not say whether you propose to cover the pit with lights, but if not you will need a sort of framework to support the protecting material. We presume you have some kind of fermenting matter to afford a gentle warmth, and we should place it in the pit at front to the depth of a foot, and at back 24 inches deep, which will leave you a foot to the glass. Leaves will answer, and with 6 inches of soil upon them will be so firm as to leave you a foot clear in a short time. The soil should be rich loam, light rather than heavy, and when it is a little warmed you may plant the Potatoes in rows 15 inches apart, and the sets a foot apart in the rows, placing them 4 inches deep. Radishes may be sown over the surface, and the seed be either raked in or covered with half an inch of soil. All the treatment required is to expose fully when the weather is mild, and protect from frost by mats and straw coverings in severe weather, not removing them in continued severe weather until a general thaw. If you can command an abundance of protecting material commence at once, but if not we should defer planting until early in February, in the meantime having the sets in a suitable place to sprout. When they have pushed shoots from one-half to three-quarters of an inch long you may plant. We grow in frames Sandringham Ashleaf, Myatt's Prolific Ashleaf, and Veitch's Ashleaf. The first is earliest, but the last two are better croppers, and for your purpose would be most suitable. We have no book treating of Potatoes.

PEARS FOR WALL—SELECT AZALEAS (J. W. L.).—Pears: *Beurré Superfin*, *Conseiller de la Cour*, *Marie Louise*, *Beurré Diel*, *General Todtleben*, and *Gloir Morceau*. Azaleas: *Criterion*, salmon pink with white edge, spotted lake; *Duchesse Adelaide de Nassau*, rosy scarlet, tinged violet; *Mars*, orange scarlet; *Kinghorn*, rosy lilac; *Mdlle. Marie Lefebvre*, white, semi-double; and *Mrs. Turner*, pink, margined white, upper petals spotted purplish crimson. *Camellias*: *Bonomiana*, white, flaked carmine; *Mathotiana*, crimson; *Valtevedro*, rose; *Mrs. Cope*, white, striped crimson; *Fimbriata*, white; *Storvi*, rosy pink.

BURN KNOT APPLE.—"E. P." would be obliged by being informed where this Apple tree can be purchased.

GOOSEBERRIES FOR GREEN JELLY (Amateur).—Grow the following varieties as you wish them to be late:—General, Shiner, Telegraph, and Thumper.

GRAPES NOT KEEPING (A. B. C.).—Grapes are not keeping well this season, and it is likely your house is too moist, and the size of the berries and want of colour show they have not ripened perfectly, which is against their keeping. The want of colour is probably due to too heavy cropping. The remedial measures to be taken will be to keep the atmosphere drier, to apply fire heat only by day after the Grapes are ripe, with abundance of air, and leaving a little air out at night, but no fire; having the border covered with shutters to throw off the rains, and so keeping the roots from throwing too much moisture into the berries; whilst a less crop, with more air, and probably a lower temperature when ripening, would give you a remedy for the want of colour.

VERONICA AND SOLANUM LEAVES BLACKENED (S. E.).—The leaves are covered with a black fungus, a consequence of honeydew being deposited upon their surfaces by the insects the plants have been or are infested with, and which we think in the case of the Veronica are brown scale. In that of the Solanum the evil may arise from aphides infesting the points of the shoots. The aphides may be destroyed by fumigation with tobacco; and the brown scale may be destroyed by a solution of soft soap, half a pound to two quarts of water, to which add about a wineglassful of spirits of turpentine, and apply with a brush at a temperature of 120°. The scale will be removed at once, and the plant in about three hours afterwards should be laid on its side and thoroughly syringed. The solution should be kept from the roots. It will destroy every species of scale. The white scale on Acanthias it browns and removes.

LILIUM AURATUM SEED SOWING (Rush).—The seed should be sown at once in pots or pans filled to within half an inch of the rim with a compost of equal parts sandy peat, leaf soil, and fibrous loam, well drained. Level the surface and scatter the seeds evenly, and cover about a quarter of an inch deep with fine soil. Water gently, and place on a shelf or in a light airy position in the greenhouse, and keep moist, but avoid making the soil sodden. In due course the plants will, if the seed be good, appear, and then water as required to keep moist and promote a free growth. By next autumn the seedlings may be shifted into other pots or pans, placing them with every root carefully about 2 inches apart, and about an inch below the rim, so as to allow for a light top-dressing of soil in spring; and, being duly attended to with water, they will by the following autumn be fit to pot-off singly in 7-inch pots, and after another season's growth they will be of a flowering size. The soil only needs to be kept moist in winter.

SHUTTERS FOR SHELTER ON SEA COAST (Della Rocca).—We should not confine ourselves to evergreen shrubs or trees, but have deciduous as well. At the most distant point of view we would have a line at least of Sycamore at 15 feet apart, with Mountain Ash midway of the distance, and between

these a yale and the Sycamore, at 4 feet distance of course, the scarlet-berried Elder (*Sambucus racemosa*), and in front of these inwards a row of Gaudier Rose at 4 feet apart. We should then commence with evergreens, and have Austrian and Corsican Pine at 8 feet apart, and fill-up to 4 feet apart with Tamariusk. These will give you a good background, and you will need to arrange for the front next the house, forming curved lines, and so as to have groups or clumps, or what will appear as such, with a few specimen and taller subjects dotted here and there. The Chinese Juniper, *Pinus insignis*, Evergreen Oak, and Broad-leaved Holly are desirable for specimens. *Alaternus*, *Arbutus*, *Laurustinus*, and the different kinds of *Hollies* do well; also *Broom*, *Cotoneaster*, especially *Simmonsii*, *Double Gorse*, *Escallonia macrantha*, *Garrya elliptica*, *Evergreen Privet*, *Eugonymus*, and *Sweet Bay*. These, or some of them, judiciously arranged will give you all you require; but we cannot instruct you as to their arrangement for effect, as this would require to be done by someone on the spot.

WATERING PLANTS IN WINTER (J. W. L.).—It is not necessary to water plants in winter so much as in summer. Some of them will be at rest, as *Fuchsias*, and only require water to keep the wood from shrivelling, and the same remarks apply to all deciduous subjects. Evergreens, as *Camellias* and *Azaleas*, with *Acacias*, will require to have the soil always moist, watering only when they need it, which at this season may be twice a week, or oftener, as the weather and fullness of the pots with roots may determine; whilst subjects which are growing freely, as *Cinerarias*, *Cyclamens*, and bulbs will need to be kept well watered. Before the foliage falls, a thorough watering should be given, sufficient to show itself at the drainage. This is the whole and sole art of watering for evergreen and deciduous plants in a growing state. In watering we must be guided by circumstances. Syringing is not necessary for greenhouse plants in winter. You will find the treatment of most greenhouse plants in our new edition of the "Greenhouse Manual," which may be had by post from our office for 19d.

ARRANGEMENT OF FLOWER BEDS (A Very Old Dublin Subscriber).—Convert the parallelogram into an oval for the Roses, surround it with a band of beds composed of four curved oblongs, alternating with four circles, keeping a strip of turf 5 or 6 feet wide between the oval and the enclosing beds, which should be about 5 feet wide. Flowers may be planted among the Roses without hurting them provided the soil has an annual dressing of manure.

INSECT IN APPLE TREE (W. L.).—The caterpillar which has completely eaten through the whole length of the stem of your Sturmer Pippin tree is that of the well-known and very destructive Wood Leopard moth, of which a description and figure, with an account of its habits, were published in No. 485 of this Journal.—I. O. W.

NAMING PLANTS FROM SPRAYS (A Constant Reader).—We do not recognise the spray of the shrub, but it resembles an *Alaternus*. For identification, flowers as well as leaves are necessary.

NAMES OF PLANTS (E. Cornelius).—1, *Eryngium virginicum*; 2, *Muhlenbeckia complexa*. (D. Thomson).—Owing to the very imperfect material we can only name your Conifers approximately. 1, *Taxus Menziesii*, *Dougl.*; 3 and 5, two species of *Abies*; 4, *Biota (Thuja) orientalis*, *L.*; 6, *Libocedrus chilensis*, *Endl.*

POULTRY, BEE, AND PIGEON CHRONICLE.

TRIMMED HAMBURGHS AT THE OXFORD SHOW.

MR. HEWITT has received a letter from Mr. Long containing the following as an explanation: "The second bird examined was May's bird, the same man who originally bred and showed mine. I wished it to be seen to show that the original breeder was the clipper. He sold it to Hyde, and Hyde to Duckworth; Duckworth, not long before Oxford, writing me to sell it to him again. He knew of the clipping, or how did he manage to enlighten me?" Mr. Hewitt adds—"No one can possibly be more regretful than myself to say even a single word to wrong anyone, and Messrs. Duckworth I never saw nor corresponded with in my life; and I will add that, so far from being a rare matter, any general judge knows that prize pens of poultry are constantly being shown, first in one name, then in a week's time in quite a different name, and as rapidly get transferred back again to the original owner."

THE POULTRY-KEEPER.—No. 27.

THE PADUA BREED—DUTCH CRESTED VARIETY.

IN the most of these varieties the hen has much richer and more characteristic plumage than the cock, and as the principal interest attached to them is the pleasure they give by their appearance, I shall begin by describing the female first, as it is with her we find the most striking points. Though these varieties are almost entirely selected as being ornamental, they are not less good for the table. Their flesh is very fine, and they are generally excellent layers. The chickens are very precocious, but their tenderness renders them very difficult to rear. But after several generations in the same country they become more hardy.

PADUAS OR FOLANDS.

This variety is one of the strongest among the fancy varieties. The flesh is delicate, their laying very good, and they are non-sitters. It is remarkably well crested, which forms its principal ornament. Its plumage is one of the most rich as well as variegated, and wonderful in regularity. Three essential characteristics are—the crest, the plumage, and the complete absence of comb, the ear-lobes and cheeks being what amateurs call

"without flesh." The cheeks only appear a little with the cock. The crest, very largely developed in both sexes, is not always alike. With the cock it is composed of lance-shaped feathers like a parasol, and altogether much larger than the hen's, which is perfectly rounded and separates in two parts by a sort of cleft, which goes down the beak and disappears at the back of the head. The crest is very large, grown on a fleshy mass called "the mushroom," which covers the skull and is a little thrown back behind, so as to be off the eyes. This "mushroom" should be very much developed in well-bred birds. Each feather of the crest is in bands of colour; in the Silver

Fig. 130.—Crest Feather.

Fig. 131.—Hackle Feather.

variety surrounded with white, then marked with black, then white in the middle (fig. 130). After the second and third moulting a part of the crest feathers becomes white, which always increases as they get older. The feathers of the hackle (fig. 131), are like those of the crest, but less pointed.

CRYSTAL PALACE POULTRY AND PIGEON SHOW.

A FEW INTRODUCTORY WORDS.

THE extraordinary increase of the fancy for poultry and Pigeons may be seen in the fact of the notice and space now given in the London daily papers to the shows held in various parts of England. Until recently it was not so; there were the poultry papers, dear to every fancier, read and re-read by them, but they "were caviare to the general." Now, however, the daily paper which caters for the many is obliged, so to speak, to give space to poultry matters, because the many, not the few now, are interested in them. Then, too, this interest and love is no mere mania, for a mania dies away full speedily, it makes a rapid growth, and then its object is even despised; but this love of poultry has lasted for many years. All this the press knows well, and in giving striking details one diligent writer, who has a head for weights and measures, tells us that in regard to the Crystal Palace Show of this year, "If the pens were placed side by side they would reach a distance of three miles, and the weight of the cages alone is upwards of ten tons." This, I dare say, is all true. The Show is of vaster proportions than ever, but neither judges nor critics wish it to be larger; on the other hand, speaking for myself as an ardent fancier, I would say, May the quantity rather diminish than increase, but may the quality improve yearly. Last year the number of pens were 3605, this year they are 4100, in other words 800 more, and 800 would themselves form a show. To speak in praise of the Palace as a show-room would, indeed, be foolish—there is no show place equal to it, and there never can be a better. The noise of the crowing under that high roof is reduced to a minimum; and when the organ is rolling is, indeed, unheard. Everyone seems, as in former years, to be very courteous and attentive, from Mr. Wilson down to the humblest attendant. I wish the Pigeons could be fed in troughs rather than have the food scattered on the floor, and that the water vessels were outside the cages; then the birds could not either eat food soiled with manure, or defile the water and spoil their own plumage by attempts to wash, as I saw one of the Black Trumpeters doing in one of the four grand pens. Still this is but a small thing, and we must, in finding fault, however justly, remember the vast amount of labour entailed by this vast Show, and I can only be surprised at the few blots and the excellency of the general management. The well-arranged chrysanthemums in front of the theatre and under the dome gave brightness

to the scene. (Ah! what should we do without flowers? All honour to old Adam's trade), while the evergreens soothed the eye, and made glittering shops less glaring. In short, there is but one Crystal Palace, so also there is but one Show—that held within its glassy walls. So much for introduction—WILTSHIRE RECTOR.

TO-DAY is the last day of the grand poultry tournament of 1874. Twenty years ago anyone would have laughed at the bare idea of 4400 pens of prize poultry existing, but close on that number are on exhibition at the Crystal Palace to-day, and have been since Monday last—on exhibition at one Show, in one building, at one time! The very fact seems incredible, but a fact it remains. The question must arise to all, Is this the end, or is this the beginning? Has the poultry mania really reached its height? Will it keep as it is, or will it, having climbed the mountain, quietly come down the other side? We think not; nay, we may almost say we feel sure not. For though annually perhaps two or three of the good old stagers may retire, still the new comers are legion. We only have to glance at the prize list below to see this. New names are thickly strewn among the winners. New names abound in the catalogue. We like to see old friends win, but we also like to see the younger exhibitors doing the same; and to win at a show like this is winning something. Why, many value a high commendation at the Palace more than a first at a local show, though the result may not be so satisfactory in the pecuniary view. We think, considering the gigantic proportions of this monster Exhibition, that the judging has been very fairly satisfactory. Everyone cannot win. When there are a hundred pens in a class, and only six or eight prizes, some must be left out in the cold. We must remember that—

"Times go by turns, and chances change by course
From foul to fair, from better hap to worse."

The Crystal Palace Show is always a great place for sales, and one may come to the Palace and satisfy his requirements, be the breed what it may. And those who simply come (as by-the-by so many do) on purpose to buy some specimens of prize poultry to start for themselves, and hardly know what breed to go in for, why, they can take the showman's advice: "Pay your penny, ladies and gentlemen, and take your choice." We think we may almost call the Palace Meeting the poultry's "at home;" for certainly never anywhere else do we meet so many friends and fanciers, and we do not wonder that they come apart from the actual pleasure of meeting friends, and enjoying a good poultry chat, which pleasure we know to be very great. Still we say we do not wonder at their coming themselves, for how lonely they would be at home! The runs empty; the exhibition pens empty; no crowing at early morn; no favourites to watch; not even, perhaps, in many cases, a stray empty show basket to cheer up a lonely spirit. No, we do not wonder that all attend this Exhibition.

The management here is always good, and the Secretaries, whose names we all know so well, are always courteous and ready to do their best. Somehow at the Palace everything seems bathed in *couleur de rose*. The pens look all so clean and so well grouped, and the long avenues of birds so pleasing to the eye; but we must not forget that in these avenues there are close on 4400 pens of birds, and that though the poultry world has met to look at them, we have come to criticise.

DORKINGS.—In cocks there were fourteen entries. First, a very perfect dark-coloured bird with a splendid comb. Second, a huge rose-combed bird of great breadth and bone, his only weak point being his comb. The third-prize bird occupied the same place last year, but his comb has given way in the meantime. Mr. Parlett's was a large bird, with good feet but indifferent comb. No. 8 (Arkwright), light in colour and grizzly on the thighs.

Coloured Hens.—First was a very large dark bird, good in colour and feet, but with an indifferent comb; however, she was well first. Second, a thorough Dorking. Third, a very nice rose-combed hen. Pen 17 (Walker), large but crooked in leg. Pen 22 (Sapwell), a good hen if in better condition. Pen 36 (Col. Lane), very good, but unnoticed. Pen 37 (commended) was in dreadful condition, having lost all the feathers off her back. Pen 40 (Lingwood), would be very good except for corns on her toes.

The cup **Coloured cockerel** was very large in body and good in comb, but rather in-kneed and crooked in the big toes. The second-prize cockerel was the cup bird at the Birmingham summer Show; he is a very smart bird with a beautiful comb, but had caught a bad cold in his eye. The third cockerel was good if we except his comb. Fourth, large, but a little round in the back. Fifth, a nice dark, short-legged bird, but with very white ears. Pen 51 (Burnell) was a very broad bird with good comb and plenty of bone. Pen 72 (Raines) was, like the cup cockerel, rather inclined to be gouty. Pen 76 (Bartrum), very large, but with a very bad comb and pink legs, otherwise he is huge. Pen 79 (Wren), a good-bodied bird. Pen 83 (White), should have been in the prize list.

The cup **pullet** was broad and deep, with a good comb. The

second pullet will soon be bumble-footed. Third rather light in colour. Fourth was a mistake, as she had very sooty feet and yellow toe-nails. Fifth a bad colour, but large and good in feet. Pen 113 (Ruttlidge) was large and dark, and should have been in the prize list. Pen 117 (Batruan), good colour and comb, but sooty feet. Pen 121 (Pillington) fourth and fifth toes joined, otherwise a very good bird.

Silver-Grey cocks as usual did not muster very strong. The first cock was good in comb, colour, size, and feet, but he had one bad fault—his right spur was outside. The second cock was rather grizzly on the thighs.

Silver-Grey hens were a good class. The first large and perfect; she occupied the same place last year. The third hen was not very clear on the wing, but was good in size.

In *cockerels* Mr. Cresswell brought out an immense young bird, which easily took the cup. Two second prizes were given, and both to good birds. The third-prize cockerel was particularly good in comb, but was not equal to Mr. Cresswell's highly commended pen, the Oxford cup bird. Pen 147 (Pasley), small but perfect. Pen 155 looked old for a cockerel.

The first *Silver pullet* was well placed, large, silvery, and with a particularly good robin breast. The second-prize was a mistake, as her spur showed badly on the outside; however, she was bought at the auction by some lucky individual. The third was a much better bird.

In the *Cuckoo Dorkings* the awards did not generally please. Pen 186 (Young), were good. Pen 187 (Allen) should have been second. Pen 188 (Gamon), was the Oxford cup pen, but here unnoticed; they were thought by many to be the best pen in the class. Pen 190 (Howard), contained a very perfect cock, but not quite large enough; he had the best comb in the class. Pen 193 (Darby), were large and bright in colour. On the whole, this class was an improvement on last year.

White Dorkings still run too yellow in colour. The first were neat, but not large enough. Second, a very good pen in comb, shape, and colour. Third was a grand old cock. Pen 196 (Williams), should have been noticed. Pen 197 (Hayne), large but yellow. Pen 205 (Countess of Dartmouth), very cheap at 30s.

The five-guinea Selling class did not contain many bargains if we except the first-prize pen, which contained a good cock.

Cocorns.—The display of Cochins was something remarkable. Most certainly there has never been such a collection at the Palace before, and we really should almost think it was the best lot ever got together anywhere. Bufts, Blacks, Partridges, and Whites were all good. We cannot help saying we should have placed two or three of the prize cards on different pens, especially in the White and Partridge; but on the whole we thought the Cochins judging very good indeed.

Old Buff cocks came first. We suppose Mr. Burnell's old cock is the best old Cochins cock alive. We know he refused £60 for this bird on Tuesday. Certainly his colour is a little too deep to please us, but he is a wonder, and was well shown. The second was a fine old bird, but we thought him a little mottled. The third was also very good, but wanted leg-feather. 230 (Tindal), was a fine bird except in comb, but he has come out of his moult rather mealy on the wing. 232 (Taylor) was not particularly well shown, which put him out of it, or else he is a bird with much quality.

Buff hens were a nice lot. The first won in a canter, she is very large, and well fluffed; the second was of very admirable shape; the third an immense hen, but a little mottled, still she well deserved her place. Pen 240 (Bloodworth) had splendid feet. 241 (Tomlinson) was a pale hen, but she looked a good useful bird. 242 (Lingwood), was very large, but we did not care for her colour.

Buff cockerels mustered well—no less than thirty-five entries. The cup bird was very grand, his colour perfect, and his comb very good; he ran in first. This is the bird we mentioned some time ago as likely to be a "stickler" when he came out. We have heard of him for a long time, and were not disappointed when we saw him on Monday last with the cup card on his pen. The second was a well-grown bird, but he was a little too dark, and he has a great deal of black in his foot-feathering. Third had not a good comb, or he would be a good chicken. The fourth we admired very much, and expected to have seen him higher. 255 (Burnell) was a good colour, but rather small. 261 (Cartmel) rather mealy on wing, but a good chicken. 279 (Crabtree) had a bad comb rather, or else his colour was very good.

Buff pullets were a glorious class. The first was the lovely bird we noticed at Oxford. She was looking well, and we may safely say we call her the most exquisite Buff pullet we ever saw. Her colour, shape, and symmetry make her a perfect picture. The second was a good bird too, of nice colour, and with most beautiful legs; third also very good and well shown. Fourth was a splendid pullet in shape, but we thought her colour a shade streaky. 288 (Harrison) a good bird. 289 (Christy) of splendid shape, but a trifle too variegated in colour. 314 (Lady Gwydyr) was of lovely colour, but hardly large enough. 322 (Crabtree) of splendid shape, and with very good leg-feather. We should have liked to have seen this pullet in the list.

For old *Partridge cocks* the first won easily, but he is not so good as the cup bird of Mr. Shrimpton's of last year. The second was rather small and a little out of form. The third was narrow, or else he was of good colour. 323 (Taylor) was rather brown in fluff. 330 (Crabtree) was a very large and good bird, but rather mixed in colour.

The *Partridge hens* were very good, and we thought them admirably judged. The first was a grand bird in size, shape, and pencilling, and well deserved her place; the second also very good indeed. The third was of good shape and a grand bird, but her tail looked suspiciously on one side at times. 342 (Pope), a very large but badly-marked hen.

In *Partridge cockerels* the first was a large good bird and heavily feathered. Second also good; a young friend, we fancy. The third struck us as being narrow. We should have placed here in preference pens 359 (Shrimpton), or 371 (Fowler). 351 (Tudman) had a nasty comb, but was otherwise good. 366 (Leeming) a good bird, and superior again to the third.

Partridge pullets were a lovely class. The winner walked in easily; she is a real beauty. 382 (Shrimpton) was a good bird, but wall-eyed on one side. 373 (Taylor) we heard was disqualified for being an old bird; but though we scrutinised her very severely, and though we confess she looked a trifle antique round the eyes, still we could not have said positively she was an old bird, and we would have given her most assuredly the benefit of that doubt, which many another pullet (?) in the Show also enjoyed. The second-prize was very large, but bad in colour and markings. The third was a very young but good pullet. 394 (Taylor) was an oldish-looking but well-marked bird.

White Cochins made four good classes, the pullets being an unusually grand lot. The old cocks were not over the moult well; they all want another month. The first was a very fine well-made bird, and good in colour. The second was also good, but had a bad comb, and a comb which will not improve, we fear, as the season advances. He much reminded us of a cockerel of Mr. Burnell's we saw at Birmingham last year. The third we did not care for; he was an ungainly bird, and coarse-looking. 402 (Whitworth) very fine and large, but bad in colour.

In *hens* the first took the cup for the best pen in the four White classes. She had the ugliest comb we ever saw on a Cochins—huge, uneven, and coarse; but her shape, fluff, and wings were very grand. The second-prize hen was perfect in comb, but not quite so large, perhaps, as the first, otherwise we should have placed her first most certainly. Third a good hen too, but a little scaly on legs. 405 (Beldon) good, but more leg-feathering wanted. This hen had a very long wattle on one side, and a very short one on the other. Highly commended 415 (Holmes), a good hen.

In *cockerels* the first was a beauty; his colour and shape very grand, but he was rather too hooked for our taste; still he was honestly shown, and will be a wonder as an old bird; and here we should have gone for the White Cochins cup. The second was coarse, and had inside leg-feather, which we dislike so much. Third a good bird, but badly washed. Highly commended 418 (Christy), a good bird with sound comb.

There were nineteen *White pullets*, and we never saw nineteen better ones. The first was large, but had a huge comb, much resembling the cup hen's, and was not of very good colour. Second very young and very white, and will make a wonderful hen if all go well. Third a capital, well-shown bird, the same bird we saw at Long Sutton, we imagine. All the highly commended birds were good, and would have won easily in any ordinary competition. We think this breed has made rapid strides of late years in quality and quantity.

The *Black Cochins* came to the front well. We do think this breed is rapidly improving, but we should like to see better legs and better shape; in so many of the specimens there seemed signs of some cross which had not been bred out. The colour is certainly improved since last season. The old cup birds were a showy pen, but the hen was too large for the cock, and both want more leg-feather. The second was a good pen; but we saw a few red feathers on the neck. The third had a grand old hen, the old friend we have so often noticed; she begins to look old now, but certainly we never saw such feathers and fluff in a Black before.

Black cockerels, too, were for the most part much improved. The first cockerel was the Oxford cup bird; he was run up to £7 or £8 in the auction, and was cheap too. The second had the best head in the class; he was not quite so large as the first, but his colour very rich. The third was a large bird, and well made. 459 (the American bird) did not look so well as at Oxford.

In *Black pullets* the cup bird was of beautiful symmetry, and good in comb, with a beautiful lustre; we thought this the best Black pullet we have yet seen. Second was also good; she was large, and very fairly symmetrical. The third was a good-coloured very young bird. 485, commended (Aspden), a capital well-grown bird; 477 (Athole), a good colour, but a most shocking comb: this was, we think, the third Oxford pullet.

The £5s. Cochins Sale class had some capital pens. The first walked in easily. They were a good pen; the cockerel of fine

colour, but a little white in wing. This pen fetched a long price at the auction. The second was a fair pen of Whites; the cockerel well-grown, but rather creamy; the pullet small. We should have almost placed here pen 509 (Shrimpton), where the cockerel was of beautiful colour, and had a very good tail in shape and colour. The third were fair Buffs; not so good as 508, which were fourth. We fancied in this fourth pen was the Buff cockerel, we believe, which won third at Birmingham, and which some said should have been first (we speak of the late summer Show); he is, however, poorly leg-feathered, though of good colour. 526, highly commended (Fowler), was a good pen, promising to make-up well.

Brahmas.—The entries in the ten classes for Brahmas numbered 675—a good-sized poultry show in themselves, and, if we mistake not, half the number of the whole Crystal Palace Show five years ago. Greatly has the standard risen in the Dark Brahma classes since two years ago. We can hardly imagine it possible for greater perfection to be attained in cockerels as to size and colouring; form may well be improved, for the giant frames which now win lack much in comeliness. The pullets, on the other hand, are marvels of pencilling and colour, but not larger, if so large, as the winners of a few years ago. Vulture hocks, or at least the nearest approach to them, are again in favour, and in the Dark classes bare legs have totally disappeared.

Dark cocks, as a class, were not well through the month. First on the list Mr. Ansdell's bird, the cup-winner, was a fine tall bird of exquisitely-silvered back and hackle, bright green wing-bars, and black fluff. Second was a much more compact though far less bird, beautifully through the month, inclined to the fault of vulture hocks above, with poor leg-feathering below. Third was a bird of the same type as the first, but his comb was large and loose. We did not admire him. Fourth was a very massive bird, deep-breasted and short-legged, decidedly hooked, but splendid in foot-feathering.

Dark Hens.—Mr. Lingwood's cup pen was a marvel in breast-pencilling and good all round, but as far as we could see in her elevated position, somewhat indistinctly marked on the back. Second a beautiful bird of the Silver-Grey type, moulted-out like a pullet. Third a grand bird, the very perfection of shape, unmistakably vulture-hocked. Fourth also fine in form and breast-pencilling, too, but lighter than we like in fluff. Fifth another large well-shaped hen, but too brown.

Cockerels.—There was a strange family likeness in six of the eight winning cockerels; they were huge birds of the old Brahma type, totally distinct from the Cochins form, with up-standing tails, this ornament in several of them being larger than we can admire. Mr. Ansdell was the proud winner of the twenty-guinea cup; his bird was tall, broad, and well filled, densely black in fluff and breast; he well deserved his place. Second had a beautiful little head combined with great size: both these birds had long tails. Third another bird of the same type, with a very peculiar, and we thought ugly tail, like an exaggeration of the Gronse tail; still he was a grand fellow in size, and well-marked. Fourth was somewhat spoilt to our fancy by the centre ridge of his comb being very high. Fifth was a neat bird of Miss Douglas Pennant's, much smaller than his superiors in the list, and with too depressed a comb, but well pencilled. Sixth was a bird of Mr. Lingwood's own style, and one which not a long time ago could not have failed to secure the highest honours. Seventh, another good bird, not quite so broad as the sixth. Eighth, a very nice, very young bird, somewhat lightly pencilled in hackle, moderately feathered, and with beautiful orange-coloured legs.

Pullets.—Size and form, as we have said, struck us as wanting in this class. The cup went to a bird of as beautiful pencilling as we have ever seen—dark and crisp on a silver ground, but she was small and poorly feathered on the leg. Second was not unlike her, now a well-known bird, perhaps not quite so perfect in pencilling as the first, but a little larger; she also is rather under-feathered on the leg. Third was a bird nice all round, but very light on the head. We admired the fourth-prize bird, and should have put her higher; she is large with small and even pencilling, the type of bird Mr. Wright generally shows. Fifth, a fine bird in form and colour; she certainly did not look to us like a bird of this year, otherwise we should have put her in the first place. Sixth would also have been higher had her head not been white. Seventh was small but most strikingly pencilled, the markings being glossy black on a pure white ground. Eighth was a fair bird all round; probably her distinct pencilling up to the throat caught the Judge's eye. Over fifty birds received notice in this class. There followed a Selling class for pairs (cock and hen), not exceeding five guineas in price; some good birds found their way into it, but as a whole it hardly deserves much criticism, being chiefly remarkable, as might be expected, for ill-assorted matches. A fine deep black-fluffed cock in the fifth-prize pen caught our eye, and appeared one of the best birds in the class.

Light Brahmas were not behind their Dark relations in number, though in quality we thought them by no means their equals; no bad birds found their way into the prize list, but

beyond the winners there were many, especially in the classes for chickens, poorly feathered, and second-rate in style.

Cocks.—The leg-feathering in this class was good, at least in the case of the winners, being full without vulture hocks. The cup went to a cock of medium size and very neat shape; dark in neck-hackle and other points. Second was a fair bird, not well through the moult; his tail hardly grown, and some old yellow neck-hackle still apparent. Third had an ugly comb, but clear good hackle and splendid foot-feathering. Fourth was pale in comb, fair in hackle, and remarkable for fine deep fluff.

Hens.—The cup bird did not strike us as large, but she was very white; apparently she was mopeish when we looked at her, and may not have looked her best. Second was, in our opinion, far ahead—a beautiful and faultless bird, perfect in neck-hackle and foot-feathering. Third was neither so good in marking nor so clear in ground colour as the second. Fourth was a very good hen; here and there the dark under-colour peeped through too much, but we should have put her second.

Cockerels.—The first cockerel in the catalogue was a nice bird all round and unnoticed, which led us to expect greater general merit than we found. Mr. Maynard's cup cockerel was grand in size, and taking the bird all round the award was a correct one; his colour was good as Lights go (they are nearly all tinged with yellow), his legs well feathered, with soft curls round the hocks; a tinge on the neck-hackle took somewhat from his beauty at first sight. Second was much longer in limb than the first, but a less compact bird; his under feathering was very dark, and tail a rich black. Third, a well-shaped bird, with just a nice medium quantity of neck-pencilling and leg-feathering. Fourth, a tall and stately bird, not so white as he might be, with intensely black under-down. Fifth a very nice bird, not dark enough in neck-hackle, or white enough on back and wings, but correct in leg-feathering and richly black in tail. Sixth such a bird as we should like to breed from, not large, but shapely, very white, with lovely neck-hackle, but sparsely feathered on the leg. Seventh was not remarkable for form, but had a fine and delicate white edging to his tail feathers, so difficult to acquire. Eighth, a tall cockerel, with poor comb and little hackle-pencilling, but with attractive clean yellow legs. Beyond the winners many cockerels were narrow and poor in leg-feathering.

Pullets.—In this class the earlier winners were grand birds; then there seemed a great gap in merit, and a number of second-rate birds followed, very nearly equal in point and size. The cup bird, we suppose, won her position with her form and deep fluff; we preferred the second bird with exquisite neck-hackle, and nearly the equal in figure of the first. Third was a fine, very white pullet, but with the common deficiency in neck-marking. Fourth was a pure white in ground colour, and well feathered. Fifth, not large or deep, otherwise a good bird. Sixth, a large bird with fair markings, but here we come into a region of mediocrity. Seventh was a very clear-coloured bird, but brownish in neck-hackle. Eighth was too much marked on the back. 1082 (Percival), was nice pullet, well hackled, and better, in our opinion, than many in the prize list. 1092 (Broad), was very large, and we suppose left out for her unfortunately hen-like look. A five-guinea Selling class followed, but not worthy of special notice when so many interesting classes follow.

Polands.—These were not large classes, but all were good. The first Gold cock was very fine, and splendid in crest and colour. Second also with a splendid crest. Third, good colour, but not so good in tail and crest as the other two winners. The first hen was very good, but too white in crest. Second and third good birds, but not so well spangled. We liked 1848 (Unsworth), or 1849 (Beldon), better than the third. 1854 (Taylor), a good hen.

Silver-spangled were good. The cup cock was very yellow in crest, or else it was a marvellous one, and the bird was well shown. Second and third good hens with fine crests, and well marked on the body. 1857 (Adkins), good hen, but too pale. Silver hens were a beautiful lot. The first well placed. Second and third very good. 1868 (Hinton), a charming hen, well marked, and good colour. 1872 (Long), a good bird, and will be better still in two or three weeks.

Black with White Crests mustered poorly. The first cock was a wonder, a most glorious crest, and very good in shape. Second, a nice bird, with fine crest. We do not see why third was withheld, as pen 1882 (Darby), was quite worthy of the place. The hens were well placed, and were three good birds. Pens 1885 and 1887 (Edwards) had wonderful crests, but they had not a trace of black in front, and they were too parted in the centre; still they were two good birds.

Houdans.—There were four large and good classes of Houdans. We did not care for some of the prize birds as much as some of the unnoticed ones, but it must have been a hard and difficult work to judge here. The cup bird was a large bird, but must have been closely pressed by the second, which was very large and good in comb and crest. The third was a fine bird, but a little too red in hackle, still he deserved his place. 1271 (Dring),

large and good. 1274 (Lake), a well-shown stylish bird, but hardly large enough.

In *hens* the first was smart-looking and well marked; we believe she was second as a pullet here last year. The second we did not fancy; she looked rough and untidy. The third a large bird, but a shade too light, still this was a good hen, and we liked her better than the second; but we liked pen 1299 (Dring) the best in the class. She was very grand in colour and shape, and was the bird we noticed as first at Nottingham, we believe. 1316, highly commended (Wood), very good indeed. 1307 (Quibell) good in size but rough in legs.

The *cockerels* were a good class, with not much between first and second, both being large stylish chickens. Third rather long on the legs, but a good bird. 1345 (Whitworth), large and good. The fourth was a massive heavy bird, useful, we should say, for the breeding pen. 1332 (Hibbert) a good smart bird.

In *pullets* we liked the first very much; she was good all round. Second rather small, but good colour. The third was rather narrow, but well marked. Fourth a very good bird with splendid claws. 1375 (Neville), very good. 1382 (Vallance), a promising bird of good shape. 1390 (Robin), an admirable pullet, and good in head.

CREVE-CEURS.—These, though they did not muster so well as the Houdans, were good classes. We liked the first old cock immensely, his shape and colour being very good. Second also a large fine bird, well shown. The third rather weedy, but good colour. 1397, highly commended (Mortimer), very good indeed.

The *hens*, too, were fine, as good as any we ever saw. The first had a grand crest, and was generally good. Second large and heavy. Third a fair bird, cheap at £3 3s., catalogue price. 1424 (Holmes), a good-shaped bird.

The winning *Crève cockerels* were superb. The first and second were quite pictures; we think they were the Oxford two. They looked none the worse, and walked in first and second. Third was a good colour, but we fancied his tail was on one side; we looked at him several times, and each time were of the same opinion, though we know a bird will sometimes carry its tail wrong in a pen when he is really all right at home. 1448 (Ewbank) a good bird.

Pullets were a good collection. First and second were both good, and very nearly balanced. The third good and cheap. 1463 (Wood), very massive and large, as was 1466, belonging to the same gentleman. 1467, commended (Fowler), very good indeed, but young.

ANY VARIETY CLASS.—This was a wonderfully good class, and the collection of breeds was very varied. Large La Flèche were first. They were a good pen, and had regular La Flèche heads. Second, charming White Minorcas, and beautifully shown. Third, White Sultans, one of the best pens we ever saw, good in all points, and very white. The extra fourth were a capital pair of White Leghorns, well shown, and good in comb and colour. Highly commended (Walker) capital Cuckoo Cochins; highly commended 1922 (Kitchen) Brown Leghorns, the best cockerel we ever saw of this colour, and mated with a good hen; 1927 (Ward) good Leghorns, and 1923 (Loft) admirable Sultans; 1935 (Long) good Black Minorcas, and 1941 (Jacomb) fine White Leghorns with huge combs. We admired this class immensely, and thought the winners were well chosen.

SILKIES were a good class. We fancy this breed will soon be in great estimation. The demand increases steadily, and the use of them for sitters is now appreciated by all. This breed has had its points laid down at last, and is judged by them, we are glad to see. The first was the Oxford cup pen; the second a good pair, and well shown; the third a nice cockerel and a pullet with a most exquisite crest, but sadly lacking in leg-feather. Mr. Broad had a nice cockerel, but too red in comb. We thought 1914 (Cresswell) well worthy of mention; 1915 (Darby), a very neat pair, but not quite white enough, still they were a good-shaped pair, with neat heads.

BANTAMS.—The *Game Bantams* struck one as being a little overlarge, and, having more of the *Game fowl* in them, get its size. The *Black Reds*, as usual, were the best. *Brown Reds* improved, and *Duckwings* also; but the *Pile Game* more improved than either. They now look game, and no mistake. The *Black Bantams* seem now more even than formerly; as witness of this, able judges considered 2693, only a highly-commended pen, as good as the first prize.

Sebrights are again Gold and Silver, and not cream-coloured. The first Gold, beautifully laced; so also second, Silver. The *Nankin* were poor indeed, and the first prize rightly withheld. *Frizzled*, and *Pekins*, and others brought up the rear; the former of these, the prize one, beautiful in quaintness. The *Whites* were few.

THE PIGEONS.

THESE were, as last year, arranged in the transept in front of the theatre, and that transept was more than full, as the pens of the four pairs had to be placed elsewhere. First came Class 112, *Blue-pied Pouter Cocks*.—First-and-cup, a fine shaped and limbed bird, not certainly in good show, but undoubtedly A1. He was first also last year and at Glasgow, and his owner, Capt.

Hill, is to be congratulated on his bird and his success; second is a fine bird; third, slender in girth, lengthy, but a little foul in legs.

Black-pied Cocks.—This class was not so good as the young *Blacks*. First is a noble bird and not oiled down like one near to him to improve his colour. Why is this done? Second, a bulky bird, heavily plucked in legs, but colour good; third, inferior to the other prize birds save in slenderness, in which point he excels.

Red and Yellow Cocks.—Would there were a sufficient number of entries to warrant the separation of these classes, but even both together they made but a small class. First, a good *Dark Red*, the only good *Red* in the class, and the limbs nicely covered; second, the colour inferior; third, a *Yellow*, the only *Yellow* shown in this class, a fine long-limbed graceful bird.

White Pouter Cocks.—This was a large class. First, a remarkably fine long bird; second, shape good, but legs rather bare; third, another long bird.

Pouter Cocks, Any colour and marking.—First, the huge *Mealy* that won last year. I should like a class for *Mealies* and *Chequers*, perhaps that will come like other good things; second, a *White* with a splashed tail, no doubt very useful in the loft; so also of the third-prize, another good stock bird to keep up the size of the *Pouter*.

Pouters, any colour, bred in 1874.—These young birds, like all young birds at shows, form a very interesting class, because they promise what the future birds will be. First-and-cup a *Black*, colour and markings excellent, but in bad show; second a *Yellow*, very good in crop, but apparently a little short; third a *Blue*, a nice clear colour, who will do more presently.

Pouter Hens, *Blue pied*.—First-and-cup, a splendid bird in colour, and limb, and globe, but bars not too black, and tail a little short; second small and inferior save in globe; third, well-shaped and long, but rather too flagged. No. 3000 was a very long and fine bird, 18½, and superior in my judgment to the second save in colour, globe being too gay.

Black Hens.—First good; second too heavily flagged and somewhat about—the fault of *Blacks*, for they are apt to be *Hottentot* beauties; third and No. 3008 very deserving, and marked, as it quite deserved, very highly commended.

Red or Yellow Hens.—First, the best *Red* shown as to colour; shape also very good. Second a *Yellow*, not a sound colour, but a pretty bird; third a *Red*, large, but otherwise not deserving.

White Hens.—First very large; second, a better bird belonging to the same owner; third, excellent limbs. The *Whites* were large entries.

Any Colour and Markings.—First, a very queer colour, but such a graceful bird; the first last year, the best hen in the Show this, a model of a graceful lengthy *Pouter* hen. Second, a washed-out *Mealy* but long; third, a *Chequer* and not very noticeable.

Any-colour Hens bred in 1874.—First, a beautiful *Blue* bird, not yet, I believe full four months old, a charming bird, most promising; second, none too good a *Blue*; third, to my thinking a better bird.

Having now passed in review the *Pouters* of the Show, I am aware that they have been spoken strongly against, but I think that absent birds are often thought the best; but if they were brought side by side with those less highly esteemed they would not seem so very good after all. Absence, like distance, "lends enchantment to the view." There is certainly room for improvement, and as the young *Blacks* are better this year than the old ones, I hope next year other classes, especially *Yellows*, may show marked advance.

Carriers.—After a glance at the *Pigmy Pouters*—a pretty little lot of pretty fellows—and their mates, I come to the high-class *Carriers*.

Black Cocks.—First, fine bird, noble in beak-wattle, good in eye, grand in size, with well-fitting beak, and in good condition. Second, an old bird, doubtless; beak-wattle excellent, eye in somewhat a bad state. Third, well-shouldered bird, eye good, beak not quite so good. No. 300, a very splendid bird of Mr. Montgomery, standing well off the ground. A grand *Pigeon*, but not noticed.

Black Hens.—First, a very good pen; second, nice little hen; third, good, but aged, and in very bad condition.

Dun Cocks.—First, a noble bird, but a little mottled in plumage; second, very sound in colour; third, a very nice bird.

Dun Hens.—First-and-cup—and deserved her honours—beautiful plumage, graceful form, and all the look of a *Carrier*; third better than second, except in plumage.

Any-colour Cocks.—First *Blue*. Head excellent; colour not too good—somewhat smoky. Second, *Blue* again, and better colour, but a smaller bird; third, a good bird.

Any-colour Hens.—The second-prize pleased me best.

Black Carrier Cocks, 1874.—Here came the treat as to *Carriers*. They were a large and very beautiful class, perhaps never such seen before. First, very good, but I must own I liked second best, the colour brilliant, and when so it adds much to the *Carrier's* beauty; third, very excellent, and fourth deservedly given. 3196 very highly commended and admirable.

Black Hens, 1874.—This, a beautiful class of young hens, coming hard upon the cocks, and the prize birds all very worthy.

Dun Cocks, 1874.—Very good class again, and must, from their evenness, have much puzzled the Judges.

Dun Hens, 1874.—First, very good in colour, and wonderful for her age; second, well-shaped and looks the thing; third, fair only; No. 3270 very highly commended, very good.

Blue Cocks, 1874.—First and second, about equal; third, inferior in eye.

Blue Hens, 1874.—First, a wonderful-headed bird; second and third, very good.

Such a number of excellent young Carriers do away with all fear, and I own I had some, that the Carrier fancy was declining in quality and number of fanciers.

Carriers, Any age, pairs.—First, fine pair of Blacks; second, Blues, hen very good-headed bird; third, Blacks again.

Dragoons (misprinted in the catalogue, Dragons).—Blues, single bird.—First-and-cup, beautiful colour, but to my mind a heavy bird; London style, which often means a bad Carrier. A Dragoon should be "a light little, tight little fellow," and not a Horseman. I know others, and worthy fanciers, differ from me, but I must say what I believe. Second, again too heavy; third, better; and 3316 better still. 3323, good; 3325, good also; 3331, a good bird; 3336, the best of the lot to my mind.

Silvers (Black bars).—First-and-cup, heavy style. 3353, best perhaps in class. Silvers (Brown bars), first-and-cup, nice shape. 3368, very good bird; the second-prize very good. I much like Mr. Bishop's Brown-barred Silvers, and I hope this class will be kept up throughout the country.

Red or Yellow.—First, a very fine colour throughout, in fact in colour perfect. Many in this class very heavy, as, for instance, very highly commended, 3393.

White, or any other colour.—First-and-cup a beautiful White, but a little broad in skull; second a Grizzle, with too much wattle under bill.

Any Colour, 1874.—First, a dark-barred Silver, and a very good bird; second, good; third, too much wattle and too broad skull. 3452, very highly commended, a good bird.

Almond Tumblers (Cocks any age).—First took the champion cup for best Pigeon in the Show; the colour won, beating Mr. Yardley's little champion, whose tail has become over-dark, and so came in third. But the second, son of the third, is hard upon Mr. Fulton's champion. The whole three indeed are splendid Almond cocks.

Hens (Any age).—First, second, and third, beautiful hens and admirably judged.

Almonds, 1874.—A very promising class.

Balds or Beards (Cock or hen).—First-and-cup, Mr. Woodhouse's Blue Bald, a gem in colour, head, shape, and bars; second, a Black Beard; third, a Silver Bald. This is a very pretty class, and I was glad to see it so strong.

Tumblers (Any other variety).—Cock, any age. Second, a good Kite. Sorry not to see any Mottles taking prizes, as they are birds of surpassing beauty and before Whole-colours, such as Kites.

Hens.—Reds, and Kites to the fore.

Barb Cocks (Black or Dun).—A good class, but the day of many birds nearly over from age.

Hens (Black or Dun).—First a good Dun; second a good Black.

Any Colour.—First Red, very old and bad condition. Among the hens was, first, a very good Yellow. The young birds were good, but really some looked a little too old; perhaps their owners mistook 1873 for 1874.

Jacobins (Red or Yellow).—First-and-cup the very thing in hood, chain, and mane, and a nice long bird too, which I like. Second a good rich Red.

Any Other Colour.—First-and-cup a good Black, a very good bird. Second White, and an extremely nice bird. Third White again. This class wants cultivating, for it is one of the prettiest. Whites, Blacks, and Blues are a pleasant change from the many Reds and Yellows.

Fantails (Any colour).—First-and-cup a well-shaped but largish bird; second nice, but I preferred third, as it was *petite*, as a Fan should be.

Nuns (Any colour).—I fear this class has been discouraged by the talk against it. All the prize birds were Black, but I was glad to see some very fair Reds and Yellows.—WILTSHIRE RECTOR.

Dorlings (Coloured).—Cock—1, T. C. Burnell, Micheldever. 2, A. Darby, Little Ness, Shrewsbury. 3, Henry Lingwood, Barking, Needham Market. 4, F. Parlett, Gullerwood, Chelmsford. 5, H. Humphrey, Ashington. 6, Viscount Tarnham, Shillingham Park. 7, Mrs. Arkwright, Sutton, Seaboard; F. Caws, Little Testwood; H. Young, Stapleton.

Dorlings (Coloured).—Hen—1 and Cup, Rev. E. Bartram, Great Berkhampstead. 2, F. Parlett. 3, A. Darby. 4, Mrs. Arkwright. 5, F. C. Burnell (2); J. Walker, Rochdale; T. Braden, Conopley, Leeds; Mrs. Arkwright, Henry Lingwood; Viscount Tarnham. 6, H. Humphrey. 7, Mrs. B. B. Sawwell, Aylsham. 8, F. Kell, Wetherby; Mrs. G. Meek, Balcombe (2); Mrs. T. Hind, Kendal; W. H. Demson, Woburn Sands; Viscount Tarnham; C. Fannell, Weybridge.

Dorlings (Coloured).—Cockerel—1 and Cup, T. Raines, Stirling. 2, Mrs. Arkwright. 3, Lord Tarnham. 4, Rev. H. Hamilton, Combe St. Nicholas,

Chart. 5, J. Clark, Fochabers. 6, T. C. Burnell (3); E. Rice, Sandwich (2); A. Jackson, Great Broughton; H. Humphrey; F. E. Kell; Mrs. Griggs, Romford; Rev. E. Bartram; W. H. Demson; Rev. T. Wren, Malton; S. Brierley, Rochdale; S. Newick, Hinton St. George; Lieut.-Col. B. Lane, Bracknell; J. White, Vauxhall; Mrs. Arkwright; Viscount Tarnham.

Dorlings (Coloured).—Pullet—1 and Cup, H. Lingwood. 2, E. Ponting, Buckland Newton. 3, S. Newick. 4, J. O. Hodges, Bagshot. 5, Mrs. Somerville, Chirk. 6, J. O. Hodges. 7, E. Rice. 8, W. Rutledge, Kendal; Rev. E. Bartram (2); F. Parlett; S. Brierley; Lieut.-Col. B. Lane; Mrs. Arkwright; L. Pilkington, Gateacre, Liverpool; J. White.

Dorlings (Silver-Gray).—Cock—1 and Cup, W. M. Shaw, Bury St. Edmunds. 2, W. H. Demson. 3, D. Gibson, Earlshead.

Dorlings (Silver-Gray).—Hen—1, O. E. Cresswell, Early Wood, Bagshot. 2, D. Gibson. 3, W. H. Demson. 4, W. W. Rutledge. 5, O. E. Cresswell. 6, L. Wren, Lowestoft; O. E. Cresswell.

Dorlings (Silver-Gray).—Cockerel—1 and Cup, O. E. Cresswell, Bagshot. 2, W. W. Rutledge. 3, J. J. Moser, Kendal. 4, O. E. Cresswell; W. Roe, jun., Newark; F. Cheesman, Chart Court, Ashford; Miss Pasley, Moor Hill, Fackham; W. Plummer, Canterbury.

Dorlings (Silver-Gray).—Pullet—1, W. W. Rutledge. 2 and 3, O. E. Cresswell. 4, D. Gibson; W. W. Rutledge; L. Wren; O. E. Cresswell; Rev. T. E. Cato, Wye Vicarage.

Dorlings (Blue or Cuckoo).—1 and Cup, J. Patney, Dorking. 2, Countess of Dartmouth, Alhington. 3, H. Allen, Wood Green. 4, C. Howard, Peckham; A. Darby.

Dorlings (White).—1 and Cup, J. Robinson, Garstang. 2, Mrs. M. A. Hayne, Fordington. 3, O. E. Cresswell. 4, Mrs. M. A. Hayne; W. Badger, Baschurch; O. E. Cresswell.

Dorlings (Any variety).—1, W. R. Middlecott, Dulwich. 2, H. Mills, Dorking. 3, Viscount Tarnham. 4, Mrs. M. A. Hayne; H. Beal, Slough; F. Caws; Rev. E. S. Tildeman, Childerich Vicarage; R. W. Richardson, Meaux Abbey, Beverley; J. J. Moser.

Cochins (Cinnamon or Buff).—Cock—1, Cup, and c, W. A. Burnell. 2, J. Walker. 3, H. Tomlinson, Birmingham. 4, Lady Gwydyr, Stoke Park.

Cochins (Cinnamon or Buff).—Hen—1 and 2, W. A. Taylor, Manchester. 3, A. Darby. 4, J. Walker, H. Tomlinson.

Cochins (Cinnamon or Buff).—Cockerel—1, Lady Gwydyr. 2, H. Tomlinson. 3, R. F. Percival, Northenden, Manchester. 4, W. H. Crabtree, Levenshulme.

Cochins (Cinnamon or Buff).—Pullet—1 and Cup, Lady Gwydyr. 2 and 3, Mrs. A. Tindal. 4, W. A. Burnell, St. Mary's, Walsby. 5, F. J. Harrison, P. Percival. 6, Lady Gwydyr. 7, W. H. Crabtree (3). 8, W. Ryland, Erdington; C. C. Ewhank, Langford Vicarage; W. H. Crabtree; W. A. Taylor.

Cochins (Partridge).—Cock—1, T. Stretch, Ormskirk. 2, W. A. Taylor. 3, F. Bennett. 4, E. Todman, Whitehall, Salop.

Cochins (Partridge).—Hen—1, Cup, and 2, E. Tudman. 3, W. A. Taylor. 4, T. Stretch.

Cochins (Partridge).—Cockerel—1, Mrs. A. Tindal. 2, E. Tudman. 3, B. Jones, Neath. 4, E. Tudman; J. K. Fowler, Aylesbury. 5, T. M. Derry; J. Leedham.

Cochins (Partridge).—Pullet—1, E. Tudman. 2, R. F. Percival. 3, Mrs. A. Tindal. 4, R. P. Percival; G. Shrimpton, Leighton Buzzard; W. A. Taylor. 5, W. A. Taylor.

Cochins (White).—Cock—1, Capt. G. F. Talbot, Edenbridge. 2, R. P. Percival. 3, J. Turner, Bath. 4, Mrs. E. Pryor, Weylyn.

Cochins (White).—Hen—1 and Cup, W. H. Crabtree, Kingskerswell. 2, R. S. S. Woodcock, Henbury, Tunbridge Wells. 3, W. H. Crabtree, jun. 4, W. A. Burnell; H. Beldon, Giltstock. 5, Mrs. A. Williamson, Leicester.

Cochins (White).—Cockerel—1, Mrs. A. Williamson. 2, S. R. Harris, Cusgarne, St. Day. 3, R. W. Beane, Mrs. A. Christy, Edenbridge.

Cochins (White).—Pullet—1, W. A. Burnell. 2, R. S. S. Woodcock. 3, C. Bloodworth, Cheltenham. 4, R. P. Percival; Mrs. A. Williamson. 5, W. A. Burnell.

Cochins (Black).—1 and Cup, H. Beldon. 2, Col. F. C. Hassard, Sheerness. 3, A. Darby.

Cochins (Black).—Cockerel—1, E. Kendrick, jun., Lichfield. 2, Lady Gwydyr. 3, T. Aspdin, Church. 4, H. Feast, Swansea; T. L. Nash, Sprouton. 5, H. Beldon.

Cochins (Black).—Pullet—1 and Cup, Lady Gwydyr. 2, T. Aspdin. 3, H. Beldon. 4, T. L. Nash; E. Kendrick, jun. 5, T. Aspdin.

Cochins (Any variety).—1, Lady Gwydyr. 2, W. A. Burnell. 3, Mrs. A. Tindal. 4, W. A. Burnell. 5, J. J. Walker, Kendal; J. Turner; G. Shrimpton; J. K. Fowler.

Brahmas (Dark).—Cock—1 and Cup, T. F. Ansell, Cowley Mount, St. Helen's. 2, R. P. Percival. 3, F. Bennett, Shifnal. 4, A. Bantford, Middlebury. 5, Mrs. Vigor, Uxbridge. 6, H. Waterman, Anderton, Devonport; W. G. Muligan, Springfield, Belfast; Mrs. J. G. Hepburn, Sidcup; Hon. Mrs. A. Baillie-Hamilton, Kalgemount, Woburn; W. Whitley, Sheffield; Horace Lingwood, Cretingham; J. Watts, Birmingham (2). 7, M. Leno, Markyate Street; J. Walker, Keele; Lady Gwydyr.

Brahmas (Dark).—Hen—1 and Cup, Horace Lingwood. 2, T. F. Ansell. 3, Mrs. Arkwright. 4 and 5, W. H. Crabtree. 6, Mrs. J. G. Hepburn; Mrs. Vigor. 7, F. Bennett; J. F. Bennett; Hon. Mrs. A. Baillie-Hamilton; W. G. Muligan, Springfield, Belfast; Mrs. J. G. Hepburn, Sidcup; Hon. Mrs. A. Baillie-Hamilton, Kalgemount, Woburn; W. Whitley, Sheffield; Horace Lingwood, Cretingham; J. Watts, Birmingham (2). 8, M. Leno, Markyate Street; J. Walker, Keele; Lady Gwydyr.

Brahmas (Dark).—Cockerel—1, Cup, Rev. J. D. Peake. 2, M. Leno. 3, J. Evans. 4, J. Watts. 5, Mrs. Arkwright. 6, Horace Lingwood. 7, W. A. Wright. 8, Newham and Manby, Wolverhampton. 9, Dr. J. Holmes; R. B. Wood, Uttoxeter (2); H. Chawner, jun., Uttoxeter; Horace Lingwood. 10, Rev. J. Richardson, Sandy (2); Mrs. M. A. Hayne; J. Stuart; Hon. Miss D. Pennant; J. Walker; R. P. Percival (2); Hon. Mrs. A. B. Hamilton (3); W. Birch, Barnet, Herts; G. W. Butler, Sirendham, Norfolk; F. Bennett; Dr. J. Holmes; F. Bennett (3); F. Pritchard; W. R. Garner, Dyke; Newham and Manby; G. Maples, jun., Wavertree; E. Kendrick, jun.; Capt. A. R. Warren, Emsworth; Horace Lingwood; J. Evans (3); J. Watts. 11, T. F. Ansell; H. B. Morrell; E. Pritchard (2); Rev. A. Van Straubenzee, Tettenhall Vicarage; L. Wright; Dr. J. Morrison, Kirkcaldy; W. H. Crabtree; J. Hill, Brentwood; T. Wakefield.

Brahmas (Dark).—1 and 3, F. F. Ansell. 2, J. Stuart, Helensburgh. 4, Newham and Manby. 5, F. L. Kendrick, Dorchester. 6, J. Evans. 7, F. E. Kell. 8, Mrs. E. Shuter, Bexley; Rev. H. Buckton, Shiffield; W. A. Peck, Wavertree; M. Leno; Mrs. A. W. Perkins, Beckenham; J. Evans; C. Holt, Rochdale; W. Hargreaves, Baccy; Rev. J. D. Peake; Lady Gwydyr; J. Watts (2). 9, Mrs. J. G. Hepburn; W. Birch; J. Peck, Lichfield; W. Mansfield, Dorchester.

Brahmas (Light).—Cock—1 and Cup, T. A. Dean, Marden, Hereford. 2, P. Haines, Palgrave, Diss. 3, J. Bloodworth, Cheltenham. 4, J. Mitchell. 5, Mrs. Peck; Mrs. A. Williamson. 6, Mrs. F. Cheshire, Acton; E. McMorland, Chesham.

Brahmas (Light).—Hen—1 and Cup, W. H. Crabtree. 2, Mrs. A. Williamson. 3, F. J. Cotterell, Birmingham. 4, F. Crook, Forest Hill. 5, R. P. Percival; W. Birch; Mrs. A. Williamson; S. P. Broad, Beigate; H. Treacher, Hayward's Heath; F. J. Cotterell; Rev. T. G. Wilson, Forest Hill; Mrs. J. T. Holmes; J. Long, Bromley Common.

- BRAMMAS (Light).—Cockerel.**—1 and Cup, H. M. Maynard, Holmewood, Isle of Wight. 2, P. Haines. 3, M. Leno. 4 and 5, Horace Langwood. 6, J. Leno. 7, T. A. Dean. 8, W. Young. 9, R. E. Horsfall, Grassendale Priory, Liverpool; J. Hewitt, Mashborough; Mrs. F. Cheshire; G. W. Pether; S. Lucas, Hitchen; J. Turner; F. Rayner, Shankha; J. Mitchell, Mosely, Birmingham; P. Haines.
- BRAMMAS (Light).—Pullet.**—1, Cup, and 2, P. Haines. 3, H. Chawner, jun. 4, Mrs. M. K. Shelley, Shepperton. 5, Horace Langwood. 6, J. Widowsom, Lupton, Derby. 7, J. H. Butler, Erding, in Birmingham. 8, Rev. G. Watson, Lupton. 9, Mrs. Pether; J. Bloodworth; Mrs. J. Walsh, Forest Hill; F. J. C. Corderell (2); M. Leno, Mashborough; Mrs. F. Cheshire; E. McMorland; H. Treacher; W. T. Storer, Broadwood; Mrs. T. Turner, Langwood; J. Watts. c, R. E. Horsfall (2); Mrs. Pether (2); Mrs. F. Cheshire; P. Haines.
- BRAMMAS (Light).—1, P. Haines. 2, M. Leno. 3, J. Smith. 4, K. Bird, Fulham. 5, Rev. G. Watson. 6, Mrs. F. Cheshire. 7, Mrs. F. Cheshire (2). 8, E. Keedrick, jun.; Capt. W. Savile, Wye; 9, J. Bloodworth; H. Chawner, jun.; D. Sullivan, Blackrock, Dublin; H. Prior, Hatching; T. A. Dean.**
- SPANISH.—Cock.**—1 and Cup, H. Beldon. 2, H. Wilkinson, Farley, Skipton; 3, E. Jones, Clifton. 4, J. T. Parker, Northampton; J. R. Rodbard, Wrington; Bristol; J. Barry, Bristol.

HELM CLASS.—*Single Bird*.—1, J. Ford. 2, P. H. Jones. 3, J. Bowea, Heme Bay. 4, P. K. Spencer. *hc*, J. Ford; Mrs. Dressing, Fareham. *hc*, P. H. Jones (2); H. Heritage (2); G. J. Lecky, Lewes (2); R. Cant.

SELLING CLASS.—*Pair*.—1, J. Osborn, Northampton. 2, H. Heritage. 3, C. Cork. *hc*, J. S. Price; G. Murphy, Camberwell, S.E.; W. Nottage, Northampton; B. W. Peck, Sydenham Hill; K. Barclay (2); Hon. E. Digby, Belgrave Square, S.W. (3).

COLLECTION OF FOUR PAIRS (Exclusive of Carriers, Pouters, and Tumblers).—1, Cup, and 2, R. Fulton. 3, J. Baker. *hc*, S. A. Wylie, East moulsey. *hc*, F. Brand.

SPECIAL FLYING CLASS OF HOMING ANTWERPS.—*Single Bird*.—1 and Cup, F. Lubbock. 2, Co. F. C. Hassard. 3, W. B. Tegetmeier. 4, P. J. Cheffins, Dunmow. 5, F. G. Russell, Blackbath. 6, S. Clarke, Camberwell, S.E. *hc*, W. H. Gurney, Woodworth Common, S.W.; G. Cotton, Sunningdale. *hc*, F. Lubbock; W. B. Tegetmeier; Col. F. C. Hassard (2); G. Cotton; P. J. Cheffins; G. H. Fitzherbert, Sevenoaks. c, S. Le B. Smith, Sydenham; F. Lubbock; J. T. Theobald; Mrs. Vigor, Exbridge.

RABBITS.

LOP-EARED (Self-coloured).—*Buck or Doe*.—1, W. Tomlinson, Stratford. 2, T. Myton, Udgate. 3, A. Steadman, Oxley. *hc*, Dr. Boden, West Hartlepool; T. Atkinson, Greenwich.

LOP-EARED (Tortoiseshell).—*Buck or Doe*.—1, J. Irving, Blackburn. 2, F. S. Banks, Doughty Street, W. C. 3, Dr. Boden. *hc*, Mrs. H. Rickworth, Spalding; C. King, St. John's Wood. *hc*, J. Cranch, St. John's Wood.

LOP-EARED (Yellow and White).—*Buck or Doe*.—1, J. Vartov, York. 2, J. Quick, Bryanstone Square, W. 3, F. S. Banks. *hc*, F. Loveband, Edgware Road, W.

LOP-EARED (Any other colour).—*Buck or Doe*.—1 and Cup, F. S. Banks. 2, J. Cranch. 3, T. Schofield, jun., Manchester. *hc*, J. Cranch; F. S. Banks. *hc*, W. H. Bacon, Sheffield; W. Andrews.

SILVER-GRAY.—*Buck or Doe*.—1 and Cup, Miss Mortimer, Ross. 2, S. Ball, Bradford. 3, R. H. Giew, Wakefield. *hc*, W. H. Hauds; E. S. Smith, Boston. *hc*, Miss Mortimer; E. Loveband.

HIMALAYAN.—*Buck or Doe*.—1, C. G. Mason, Rochdale. 2, S. Ball, Bradford. 3, J. Abbott, Northampton. *hc*, E. W. Bunny, Lewes. *hc*, W. W. Dove, Lower Norwood; J. Hallas, Huddersfield (2).

ANGORA.—*Buck or Doe*.—1, H. Swetnam, Fulford. 2, J. Martin, Kettering. 3, S. Ball. *hc*, E. V. Brander; W. Gladby, York. *hc*, W. Bowes, Darlington.

IRISH HARE.—*Buck or Doe*.—1, J. T. Bullett, jun., Richmond. 2, J. Hallas, 3, R. J. Foster, Ipswich.

DOVE.—1 and Cup, E. S. Sabbage, Northampton. 2, A. Lund, York. 3, B. Bidds, Newbury. *hc*, J. J. Martin, Kettering.

SKILLING CLASS.—1, F. Purser, Bedford. 2, E. V. Brander. 3, J. Wharton. *hc*, E. V. Brander; C. King. *hc*, W. J. King, Islington Green; H. H. Mosley, Croydon. c, Mrs. C. Hill, Aiton; A. Steadman.

JUDGES.—*Poultry*: Mr. J. Dixon, Capt. Heaton, Mr. E. Hewitt, Mr. J. H. Smith, Mr. R. Teebay, Mr. W. B. Tegetmeier, Col. Stuart Wortley. *Pigeons*: Mr. E. Corker, Mr. F. Esquilant, Mr. J. Montgomery, Mr. J. Percival, Mr. M. Stuart. *Rabbits*: Mr. J. Boyle, Mr. J. Hume.

GREAT YARMOUTH POULTRY SHOW.—The prizes are liberal in all the classes for poultry, Pigeons, and Canaries. In addition there are forty silver cups, but the great majority can be won only by local exhibitors. In Dorkings all the varieties are in one class, which is a great mistake. Entries close on the 2nd of December.

OUR LETTER BOX.

* * In consequence of the great length to which our reports of the Crystal Palace Show extend, many articles are unavoidably postponed till next week.

DARK BRAHMA'S PLUMAGE (W. P.).—We have examined all the feathers and find none of them perfect. However, we prefer No. 2, advising you to select, if possible, darker feathers in the breast. There is too much white in those you have sent. That which you must look for and endeavour to get are well-pencilled bodies without buff, and pencilled breasts up to the lower bill without white; the hackle distinctly marked and striped. We do not suppose you will get perfection, but knowing what it is, in colour, you may approach it as nearly as you can.

From observations taken near London during forty-three years, the average day temperature of the week is 43.2°; and its night temperature 33.9°. The greatest heat was 62°, on the 1st, 1857; and the lowest cold 14°, on the 30th, 1856. The greatest fall of rain was 1.21 inch.

WINTER CUCUMBERS.

AS a qualification for writing on this subject, allow me to say that since April, 1869, with one exception of a month's duration caused by the failure of the heating apparatus, I have always been able to cut at least six Cucumbers a-week. "Well, then," someone will say, "you can tell us how to cure the Cucumber disease." I am sorry to say I can do nothing of the kind. I have never seen it, and I hope I never shall. It was supposed to be here when I came, and there were some plants that looked very sickly, but they could not have had the disease our lamented friend Mr. Fish was so familiar with, or I should not have got rid of it so easily.

The cause of many people failing to grow Cucumbers and other plants satisfactorily in winter is their strong prejudice against moderate temperatures. Fire heat should only be looked on as a necessary evil. Of the two evils choose the least, and fire heat is just a trifle better than extreme cold. The question then is, What is the lowest temperature in which the Cucumber will exist without injury? The answer I can give is near enough for all practical purposes. 55° is the average minimum temperature aimed at here; during mild nights it is sometimes higher, and in very cold nights it is lower—50°, or even 48° a chance time for an hour or two in the morning. I consider it much safer to allow the temperature to fall thus low for a time than to have the atmosphere as it were burned up. No amount of damping-down can make the air feel genial if there be 50° or 60° of fire heat in addition to the natural temperature, and if the air feel harsh to human beings, plants will not flourish in it, though red spider will. The wonder to me is, not that those who maintain a night temperature of 65° or 70° should occasionally break down after a few weeks' severe weather, but that they ever get through it at all.

A forcing house of any description should always have sufficient piping in it to raise the temperature to the required heat during the most severe weather without driving the fire very hard or making the pipes very hot. For winter Cucumbers a couple or three small pipes under the bed, and covered with rubble, are a great help; the rubble and the soil above it in which the plants are grown do not part with the warmth so quickly on a sudden change of temperature as the rest of the house. Even if by accident the upper portion of the plant is in a much lower temperature for a short time than the one aimed at, provided the roots are comfortable and the top is not actually frozen, no great harm will follow.

I have stated the average minimum temperature—viz., 55°; the average maximum one is not so easy to give. During bright days after frosty nights the range of temperature should not be too great, and it is sometimes extremely difficult to regulate it. Fires, of course, should be stopped as soon as it is safe to stop them. Air should be admitted a little at a time as soon as the temperature

begins to rise, or, if possible, the rising should be anticipated, but never altogether prevented or suddenly checked; and remember the plants are more sensitive than the thermometer. The air should be given all on one side or all at the top, never in two opposite places at once, so as to cause a draught through when there is a great difference between internal and external temperatures. When the sun has been shining an hour or two on the plants they will bear a higher temperature, and generally towards the middle of the day in midwinter the house may be closed altogether. During mild weather at any time of the year I have a little air on all night; and the temperature during continued mild bright weather is allowed to range as high as 95° or 100° in the middle of the day.

As to soil, the simpler the better for Cucumbers as well as everything else. I have it mechanically right, and never trouble about the richness of it nor yet the chemistry. Cucumbers like soil that is light, loose, and sweet. Merely the fibry roots of grass with all the fine soil knocked out of it is what I use; it is broken up in large pieces, and not pressed together in the least. A little finer soil is placed round the roots of the plants when first turned out of their pots. Only a little soil is used at once, and then as soon as the roots come through they are just covered with another thin layer, and this is repeated as long as the plants are kept. Sowings are continually being made in order always to have young plants in stock in case of an accident; but the regular sowing for winter is made in the first week in August. Seeds are placed singly in small pots, and are never allowed to receive a check. If the house is not ready to receive the plants as soon as they commence to make the first rough leaf, they are shifted into larger pots, and kept in vigorous growth till such time as they can be placed in their permanent quarters.

As to sorts, there are so many good ones to choose from, and every grower that is successful thinks he has the best in the world, that it is not necessary to say much on this point. I will merely say, Beware of large-growing kinds, none of them that I am acquainted with is fit to eat, and few of them bear well. It is immaterial whether a variety has a black spine, white spine, or no spine at all, so long as the flavour is good and a large proportion of the fruit is eatable.

The less the plants are mutilated by pinching and cutting the better. One good plant kept growing freely will produce more good Cucumbers than half a dozen stunted ones. Therefore, if the plants get too crowded cut every alternate one gradually away altogether, and encourage the remaining ones to extend. Never stop a shoot if there is space to train it. If there is a want of vigour at any time apply manure water weak and warm; thin the fruits as soon as they can be handled; and keep the male flowers picked clean off.

Red spider seldom makes its appearance while the plants are vigorous, but it is always necessary to keep a sharp look-out for it, for if it is once allowed to gain a footing it is very difficult to get rid of it. A quick eye

will soon detect its first appearance, and it should be diligently hunted after every other day till all danger is over.

If there is any gumming or damping of the stem cut the diseased part clean out, even if you have to cut half through the stem, and scrape some freshly-burned lime, and apply as much as will adhere two or three times with an hour's interval. Lime that has been slaked is of no use, it must be caustic lime.

Mildew is sometimes troublesome when the weather is close and dull. The best cure is flowers of sulphur, and the best way to apply it is to mix it with water, and syringe it on. Place the sulphur in a watering pot with just enough water to form a thick paste, and afterwards add sufficient water to give every leaf in the house a good syringing on both sides. Avoid a stagnant atmosphere and even temperatures for all plants that are subject to mildew.

I am not an advocate for much syringing in winter. My plants are not syringed once a-month; it is not required with a moderate temperature.—WILLIAM TAYLOR.

OUTDOOR GRAPE-GROWING.

I AM of opinion that outdoor Grape-cultivation is lamentably neglected, and a few remarks on the subject may do a little towards awakening people to their own interest, and encouraging many to pay a little more attention to the plant that will in most cases bring a fair return for the trouble taken with it.

It is not uncommon to see the Vine planted against the poor man's cottage with only here and there a tie to keep it to the wall, while in all other respects it is allowed to ramble as it may, making a vigorous growth to be battered about by the wind until it is an unsightly object such as no one can admire, and indicative of a carelessness which few would like to imitate. In many instances the Vine is taken care of, and its branches trained neatly to the wall, the wood carefully stopped and thinned-out, other wood laid-in to succeed that to be taken out at pruning-time, while due attention is paid to thinning the fruit as with hothouse Vines. Attended to in this way it is an ornament to the house it is trained to; for if it is a proper sort, and placed on the right aspect, it must be a bad season indeed if it do not bring some substantial return in the shape of fruit to the person it belongs to. What a difference! I wish there was no reason to picture it in this way. But why is it so? Allowing something for an occasional disappointment in the Vine not ripening fruit in an unfavourable season, or perhaps an insufficient knowledge of its treatment, does not satisfactorily answer the question why we so frequently see the Vine growing against a cottage or on the walls of the amateur's garden, and yet so little done with it. If the fruit is not wanted for home consumption it is easily marketable at the nearest town; and even now in this town every greengrocer's shop has a display of outdoor Grapes, both black and white, which meet with a ready sale, and one dealer told me he wished he could buy more, as his customers were anxious for them. It must be understood that I do not intend to affirm that the Vine can be profitably grown in all parts of the country; the southern counties are perhaps its home, though in Hertfordshire, Buckinghamshire, and some of the adjoining counties, I have seen the Vine produce fairly remunerative crops.

One of the sorts grown appears to be the Black Cluster, a variety with small bunches and berries, and very black. I have a kind here called Miller's Grape, but which I have seen in Sussex bearing the name of Burgundy; its leaves are thickly covered with a white woolly substance, and more especially its young shoots in spring. On referring to a friend about it, he tells me that it is probably Miller's Burgundy. Then in some places the Black Hamburgh is planted, and succeeds well in some seasons. When living at Hawkhurst I saw a Vine of this sort trained up the walls and the lower part of the roof of the house on an eastern aspect, and in 1868 or 1869, I am not quite sure which, more than two or three bunches reached 2 lbs. weight, and quantities 1 lb. and less, the berries being large and very highly coloured. I believe, though the Vine has since produced very good crops, they have not equalled that of the particular year, it being a very hot dry summer. The next sort, and perhaps the best of all to grow, is the White Sweetwater, with which the White or Royal Muscadine is nearly identical; either of these will do well on a wall on a southern or eastern aspect. One in the latter position with me produced three hundred bunches this year, of which two

hundred are now hanging well coloured and developed, as well as being of fine flavour. The wall it is growing on is 15 feet high, and being that of the fruit room the eaves of the latter project enough to form a good coping. This Vine has not been known to fail in bearing a crop. I have seen a good crop on it for three successive seasons. This year the bunches are larger than common, being produced from young wood laid-in last season. The Vine is planted at the centre of the wall, and a branch runs horizontally each way; from these, twenty-four branches are trained perpendicularly at pretty regular distances apart. Each of the upright branches throws out side branches at intervals up to the top; these are formed on the spur system up to the third or fourth year, when a fresh cane is grown to take the place of the one cut out. I think in outdoor Vines it is necessary to be particular about this, for I find that after a shoot reaches four years old the wood becomes weak, and produces small insignificant eyes, the shoots of which produce bunches very little better than tendrils with a few Grapes at the extremity. It might be different to this if outdoor Vines had proper borders made for them the same as for hothouse Vines, and treated in other respects the same. The Vine in question has no preparation whatever for its roots, but is simply growing in the border, which is dug-up and cropped the same as any other part of the garden. It receives one good watering every summer just after the berries are set, but in the spring, when the buds burst into growth, they are protected with hexagon netting till all danger from frost is gone. During this time a disbudding takes place, and again a little later on. After the bunches show themselves the point of the shoot is taken out three joints beyond the bunch; these are carefully nailed to the wall, all superfluous shoots are taken out, leaving only those shoots required to take the place of old wood, the berries are thinned in due time, and all laterals kept pinched back. Beyond this there is nothing more to be done but to see that all is in a healthy state, free from mildew, &c. This disease must be watched for, and immediately it is discerned, if only on a single berry, dust the whole Vine over with sulphur in a moderate way, which will generally stop it.

I do not believe that every Vine will succeed as well as this without some preparation as to soil, for although here the soil is good enough, it is not so at every place; and where it is bad, or in a low damp situation, drain the place a little to carry off stagnant water, and get together a small heap of good garden soil, not very rich, to plant the Vine in, and add to it yearly as the Vine grows and requires it. The aim should be to induce the Vine to make a moderate growth with no pithy coarse shoots, but such wood as will ripen well and prove fruitful. Induce the wood to ripen early, and keep it all nailed close to the wall, but exposed as much as possible to the sun at all times. Never allow the growth to become thick and matted; cutting out a quantity at a time is very injurious to any Vine, especially an outdoor one, and causes a great check, such as it will not easily get the better of in one season. Always pay strict attention to stopping and disbudding in the early part of the season, and that will avert all such ill effects as stated above.—THOMAS RECORD.

SKELETONISING LEAVES AND OTHER PARTS OF PLANTS.

The present is a favourable time of the year for skeletonising, woody fibre being sufficiently hard. Procure an earthen pan holding a gallon or more, and put into it a quantity of leaves, seed vessels, &c., selected according to the subsequent directions. Pour upon them sufficient boiling soft water to cover them. This done, place the pan upon any place exposed to the warmth of the sun and the vicissitudes of the weather. Stir the leaves occasionally, say once or twice a-week, and carefully, but never change the water. The putrefactive fermentation will now soon ensue, and in about six weeks or two months, according to the nature of the subjects, many of the specimens will be completely macerated, and will require no other attention than holding them singly under the tap of a waterbutt or other small stream of water, which will wash away all the other skin and green fleshy matter. If this matter do not come off readily when assisted a little with the thumb and finger or a small knife, the leaves must be soaked for a longer time. Those of the leaves which seem liable to break during the washing may be preserved from breaking by placing them upon a little piece of board and holding them up by the thumb and finger; and should a little of the green fleshy matter re-

main fixed between the interstices of the skeleton leaf it may easily be removed by striking the leaf perpendicularly with a clothes-brush. They will now only require bleaching; this may be done very effectually by placing them in a handbox with a small vessel beside or under them.—J. H., *Gardener to Lady Caroline Legge, Keston, Kent.*

CROCUSES WITH GERANIUMS.

In reply to inquiries respecting the statement in this Journal, November 5th, of the growth of Geraniums in beds which produce Crocuses annually, and which are never removed, or rather for nine years have been undisturbed, no over-luxuriant growth of foliage in the Geranium has yet been observed, and the blooming has been all that could be desired. The wet year (two years ago) most Geraniums suffered from the cold and excess of wet, but mine were quite equal to any I saw in the district, and no perceptible difference was there in the beds that had been dug in the usual course. Those beds have the manure applied every autumn on the surface and grow Tulips; therefore it is fully twelve months on the surface before the taking-up of the Tulip bulbs commences, at which time the ground is generally dug.

It is a matter easily governed whenever overgrowth of foliage occurs, for it only needs leaving the beds for one year unmanured; but my opinion is that such a circumstance will never occur, as the two crops, Crocuses and Geraniums, are both exhausting crops, and need all the support, especially the former, that can in reason be given. At present (mid-November), my beds have got on their winter coat of manure as usual, and the Tulips are all planted, being treated the same. Occasional Crocuses were seen springing before the manurial application, and now they are thoroughly protected from the frost whenever it comes.

You ask whether the Geranium blooms better in the beds dug in the usual way. There is little difference, but in an ordinarily fine summer the undug beds produced the earliest and largest blooms. Certainly they bear drought much better.—**YORKSHIRE.**

AURICULAS.—No. 3.

I TRUST that a few words more upon these flowers will not be thought too much of one thing at a time. Perhaps this third issue of notes may seem like a gleaning of Grapes when the vintage is done; but I have purposely left out so far a notice of some desirable Auriculas, especially in green edges, in order that the leading flowers, kept a little apart, might stand out the more conspicuously, like winners at an exhibition from among the mass of competitors passed by. Moreover, intending growers of the Auricula are making eager inquiries, wisely of course seeking the best flowers. Some of these, however, money is valueless to buy, and others it will be a work of time and patience to obtain from the few growers who will sell. It must be a great discouragement to a beginner to find that, with all the heart to take a flower up, he cannot procure the plants. I would therefore hope that a brief mention of some fair and more plentiful sorts may in some degree be useful. They shall be kinds which certainly have their beauties and their points of merit, which are grown as florists' flowers, and will sometimes compete with those of greater fame—sorts which a beginner may hope to obtain without much difficulty, and with which he will be well contented through the less-exacting days of his early love until, like some of us, he has worked his slow way to the possession of the worthiest, and become old, accustomed, and severe. And while yet a "colt" (expressive Lancashire for a young hand), let him put himself in the way of the National Auricula Society's April Show in Manchester, of which the pages of the Journal will give due notice. Among the many growers gathered there, there is a good chance of meeting some who may have plants either to exchange or part with; and I hardly need to add that it is always a wise thing to bravely face the best flowers although we possess them not ourselves, and may go home again a little out of conceit with our own.

Among green edges are two which are not common, and are well worth having—Pollitt's Highland Boy, and Trail's Rev. George Jeans. The former is a true green edge with reddish chocolate ground colour, a very neat and good flower, though the pip would be considered small. The latter has a round flat pip; sepals beaded on the rim with meal that sometimes trespasses across the light green edge; body colour pretty

light lilac. Very "chancy." Beeston's Apollo, a great breeder, is one of the accessible sorts. Pip not large, often "mouse-eared;" edge fine full green; body pure and black; paste good; not a large trusser, and always blooming in autumn. Campbell's Lord Palmerston is another easy kind, "not unlike a bad Booth's Freedom," as a keen critic, "Iora" (Rev. G. Jeans), used to say. Admiral Napier is out of the same seed-batch, a pod-fellow probably, and not so lasting in the bloom through growing out of form. Ollier's Lady Ann Wilbraham is common, but a good flower, though the cheapest; petal more or less pointed; edge dark green, not always pure, and faithfully perverse in autumn-blooming. Gain's Lady Richardson is distinct; edge glaucous, like "green tea," not always pure; flower lively, and when in character altogether very fair. Lightbody's Fairy Queen, green edge, with red or maroon body colour; not constant to purity of edge, but tube fine yellow; paste and ground colour correct; good increaser. Trail's Napoleon is another red-grounded green edge; petal broad and edge sufficient, and of a dull, dead, dry green. Morris's Green Hen and Simpson's Commander have edges pure, but the petals are generally pointed, particularly in the last named. Like the two first on this list, they are not common sorts, neither is Lightbody's Inkerman, which is often a bold, dashing, taking black ground with me. I wish I could say something definite about Trail's George Lightbody; but with me the plants have the tiresome habit of blooming small heads from small hearts, which afterwards split up into several; so I have not yet had a strong bloom from it. Edge and colour are very good; tube too large; paste good. Lovely Ann comes at times green-edged, and is plentiful. So, too, is Imperator of my first list. General Neill is plentiful also, and a good flower when pure. I think among these I shall have named some green edges that might be much more readily obtained than the champion few, and which I grow for the sake of variety.

In grey edges Robert Trail is a free and abundant sort. It is often also white-edged, and no Auricula has a richer golden tube or greater brilliancy throughout. The flower is small, and, worse still, has often a cramped appearance because of the comparative narrowness of colour and edge. The plant is of inordinate size, like a Cos Lettuce, and the best blooms come from moderate maiden plants. Jeffrey's Sir II. Have-lock is at times a good flower, often rough on petal edge; Smith's Lycurgus too uncertain; edge undecided, body rich black and too broad. Trail's Mayflower, in habit rather like Lovely Ann, is a bright flower; and Simpson's May Morning will do sometimes. Lightbody's 125 is a beautiful violet, ground grey or white, but a very bad plant-maker, always splitting-up. This and Walker's Peveril of the Peak are the only difficult ones to get of those I now name. Peveril can be a very fine black-ground flower, but it remains to be seen whether it is very constant. Smith's Britannia, a violet ground; Reade's Miss Gidding, and Lightbody's Robert, maroon grounds, are prolific kinds, but apt to come wild.

In white edges I have not much to add beyond apologising for the oversight of two or three flowers I should have noticed before. Taylor's Incomparable, though it is inferior to his Glory, is worth growing, but the ground colour, a dark walnut, is too broad. Aslton's Bonny Lass is a bonny sort, true edge, and violet body colour; Trail's Beauty not always white enough, or the edge is nevertheless pretty; body black. I do not think any of the white edges so easy to meet with as the other classes; and Taylor's Glory, Favourite, Incomparable, Smiling Beauty, Bright Venus, Ne Plus Ultra (Smith's) Countess of Wilton, Regular, Lady Sale, and Trail's Beauty, decidedly difficult. The rest might be much less so.

In selfs I am very sorry I overlooked the claims of Mrs. Sturrock, a clarety maroon, for fifteen years ago she was our best self, and stands very high yet. A great number among seedlings turn out to be selfs, so we shall both hope to raise some grand ones, and be able to be very strict over the failings common to this lovely class.

In concluding these notes I have only to express my regret that the Auricula is yet so rare, and that some may read these brief descriptions and wish to test them for themselves, and be tantalised to find the flower almost beyond their reach. But it is coming round again in a few careful hands, and will be more and more seen. But it is not on the exhibition table that the Auricula looks its best. With the exception of the groups in the pans the flowers are not arranged to best advantage. The single classes stand in masses of green, grey, and white-edged flowers, unrelieved, for the sake of easier judging, and there has been no time to re-arrange them in the

best order for the visitors. After all the Auricula is a home flower, sweetest and prettiest in the Violet-like retirement of its cool shelter, each plant arranged in no rivalry to its lovely companions, but blooming for its own sake and for theirs, and placed so as to help out as well the beauties of the others as its own. I know the excitement of the exhibition morning to be a peculiarly happy and innocent pleasure, and that the hastening into the room for a first look after the irrevocable judgments are passed is rare enjoyment. But on the whole I think some of us would say that the long quiet pleasures of the gradually-expanding and closing show at home are most largely the object, and the richest rewarding of our care.—F. D. HORNER, *Kirkby Malzeard, Ripon.*

ELECTIONS OF FRUITS.

I am sure all the readers of the Journal feel grateful to Mr. J. Hinton for his industry in providing for the public the Rose Election which has lately appeared in your pages, and those who have derived benefit and instruction from it will be of opinion that there is no reason why the queen of flowers should monopolise these tables of excellence. Pears and Apples are objects of interest to everyone, and the latter, as Mr. Rivers truly remarks, "are the fruits of the people, almost a necessary of life;" and if any one of your experienced correspondents would undertake the labour of obtaining from reliable authorities lists arranged (by the senders and according to their opinion) in order of merit, of the best, say, twenty-four kinds of Pears, and the like number of Apples, and afterwards himself arrange the fruits according to the number of votes given for each, he would be conferring a great boon on fruit-growers and on nurserymen also.

Many will feel disposed to doubt whether it would benefit nurserymen, but I believe it would, and I ground my opinion on the fact that when you send an order for trees, and leave the choice of seeds to them, they charge less than when you make your own selection. The reason clearly appears to be, that growers for sale cultivate in extra quantities the varieties of fruits which they find combine the greatest number of good qualities. For instance, Cox's Orange Pippin Apple bears well, is free from canker, hardy, high-flavoured, and a good keeper; consequently a large stock of it is grown. On the other hand Cornish Gilliflower, although to my taste the best-flavoured of Apples, is an awkward grower (the spurs being so far apart), apt to canker, the fruit liable to crack, a bad bearer, and therefore scarcely worthy of cultivation. The nurseryman in his catalogue has neither time nor space to mention these idiosyncrasies, and describes the latter as "large, flesh rich, firm, and perfumed, one of the best dessert Apples." Of course this merely applies to the fruit, and so far is perfectly correct. The enthusiastic novice reads this description, is charmed, and at once makes a memorandum, "Cornish Gilliflower to be ordered," so that the cultivator for sale is bound to keep these unprofitable varieties in stock. I think this will convince everyone the election will be generally beneficial.

Lastly, as the circumstances of climate, soil, and situation have more effect on fruit than flowers, I would suggest that after the election is published and the votes summed-up, the contributors of the lists give us their experience of the kinds they recommend, and state the nature of the soils on which their results are obtained. I know a village near here, the orchards in the upper part of which produce some of the finest cider in Herefordshire, while the cider made from fruit grown not a half of mile distant is scarcely drinkable.

It may be said that as I am so ardent in the matter no person is more fit to undertake the task proposed. To this I answer—First, I have not the necessary time; and secondly, my knowledge of the subject is not sufficient to warrant my undertaking it, and it is a pity that success should be spoiled by—AN IGNORAMUS.

GARDEN LABELS.

CAN you or any of your readers inform me as to the best and most enduring kind of labels? It adds considerably to the interest of having good collections of Roses and other things if you and your friends can readily learn the name of each.

Here we have the names of various fruit trees, &c., written with a pencil on a wooden label painted white. In my experience these do not last longer than two years. Then we tried metallic labels, writing the names with some kind of

indehible ink; but the ink has sadly belied its name, and after a couple of years they, too, are useless. We have some Peach trees in pots, with their names stamped on lead plates. These are really good, but they were, I think, specially prepared, and were too expensive to be largely used. It seems to me that a label with a large, clear, distinct lettering on white crockery might be a good permanent one. Arms and mottoes are often put on dinner crockery and on children's mugs. Has something of this kind ever been tried for garden labels? It might not pay for any private individual to order a few of each of a large number of Roses, &c.; but it might pay some manufacturers of crockery to prepare and sell labels for Gloire de Dijon and La France by the thousand. If they could be sold at a penny a-piece they would command an immense sale. Were any of our large nurserymen to order them in large quantities, and send them out with the plants ordered, it would be a considerable boon to their customers.—AN AMATEUR, *Fifeshire.*

FRINGED PELARGONIUMS.

I REMEMBER, on seeing the good old variety Dr. André for the first time, shortly after its introduction, saying, For elegance such a class of Geraniums would totally eclipse the smooth-petalled section. From the number of new fringed varieties recently introduced it would appear that such is about to take place; at all events I rejoice to think that the fringed class is becoming more numerous every year.

The kind that has done best with me is *Empress*; and as I find that it succeeds best with a treatment different from that under which all other varieties which I have grown do, I wish to give your readers the history of an old plant, still flourishing, in my possession. It will be three years next spring since I purchased a plant of *Empress*—a young plant full of life and vigour, and although sent in a very small box through the post, it did remarkably well that season, blooming the whole summer through. In the autumn, however, I committed what I consider to be a mistake in the case of this variety, and that was, I cut it down along with all the other kinds in my collection; for while they were remarkably fine the next season, *Empress* was stunted in growth, and did not flower nearly so freely as it had previously, and has, with different treatment, since done.

With care I got it into a healthy growth before winter without cutting the plant down, and by Christmas it had commenced showing its flower buds, and was in bloom in April without any artificial heat whatever, none being necessary for the preservation of conservatory plants last winter. I counted as many as thirty-nine trusses of bloom and flower buds on this plant at one time, and it continued one mass of bloom up to the end of July last, after which it commenced to throw out a vigorous new growth, without any cutting-down except the mere tops on which the flower stalks were; after which I took the plants out of the pot, reduced the ball so that I could introduce it into the same pot with about 2 inches of fresh soil all round the portion of the ball I left, and by this process the plant never received the least apparent check, and is at the present time making vigorous growth, in appearance similar to what it was at the same period last year, only much larger, yet compact and bushy. All other plants of this sort that I have seen, with the exception of one other, a very fine plant, which I observed had not been cut down, were treated in the ordinary way, and were miserable stiff plants struggling for existence, and the complaint of everyone who grows it is that it does not succeed with them.—R. B. THOMPSON, *Londonderry.*

LAYING OUT A SMALL TOWN GARDEN.

IN a letter received from "J. E. W." he says, "I have a small garden, at present a desolate waste of rank blotchy grass, and with borders of straggling Nasturtiums, which I wish to convert into a more pleasing object." There are doubtless hundreds of similar cases where advice would be valued, and the following notes are communicated with the view of assisting such. "J. E. W.'s" garden is in London, which fact implies a murky smoke-laden atmosphere and the probability of an almost barren soil; for when any of the numerous building companies or private speculators obtain possession of a plot of land, the one great end and aim of all their measures is profit, and therefore before the "desirable freehold" or "elegant semi-detached villa" is announced every yard of soil that is at all rich or fertile is removed and sold to the ready purchasers

that abound both in and around the metropolis. When this has been done it is a mockery to term an enclosure upon any part of it a garden, which then could only become a reality by the tenant accumulating enough good soil and manure to cover the barren surface a few inches deep.

Premising, however, that the garden in question has a tolerable depth of fertile soil, we will first of all proceed to trench and level it. Trenching is so called from the soil and subsoil being broken up so deeply that an open and somewhat wide trench has to be maintained throughout the work in order to facilitate the breaking-up of the subsoil. The first trench is formed by taking a strip of soil 9 inches deep and about twice as wide from one extremity of the garden and conveying it to the other; the portion of under or subsoil so laid bare is then lifted and chopped to pieces with a fork or spade. It is not

taken away, but remaining in the same position is covered with the soil taken from the next strip; by doing which another portion of subsoil is cleared ready for stirring, and so it continues to the end. The importance of this as a primary measure cannot be too strongly enforced. It is so for all gardens, but more especially for those of such limited extent that every inch of space is precious. It not only opens up the soil to the beneficial influence of the air, but also reduces the whole of it to one uniform condition, and that portion of it which afterwards may be required for paths may then be covered with the necessary hard material and yet serve to nourish the roots of trees.

In the laying-out particular care must be taken to economise space and to render it as attractive as possible. To this end we will not cover any portion of it with turf, and so avoid

Fig. 132.

A, A, Flower beds edged with Ivy.

B, B, Borders for hardy flowers edged with Ivy.

C, Bed of shrubs with an edging of Ivy.

G, G, Gravel.

H, H, Vegetables.

much future trouble and vexation in trying to keep neat and ornamental that which by courtesy is supposed to represent a fresh green grass plat, but is in reality a dark brown-looking melancholy object, especially in the dull winter months. Instead of the turf we will have gravel, or even a little Derbyshire spar to walk upon, and so avoid mowing, and render the entire garden far more bright and enjoyable. But there must be greenery and abundance of it to impart softness and repose: this is best obtained by planting a broad edging of the green Irish Ivy (*Hedera canariensis*) to the whole of the flower beds and borders. No plant is equal to this for such a purpose. It is unaffected by smoke or dust, and, once established, it literally takes care of itself; its dark green elegant foliage being as much valued for its intrinsic merit as for its fine effect as a foil to the gravel and the flowers which it surrounds.

In the plan (fig. 132), the flower beds are intended now for such spring flowers as the Hyacinth, Tulip, Crocus, Snowdrop, Myosotis, Silene, Saponaria, Nemophila, Collinsia, &c., and in summer for such plants as the fine gardens in the parks have made familiar to all. The borders, B, B, are for hardy flowers, such as Pinka, Carnations, Phloxes, Pentstemons, Iris, Campanula, and a host of others. They are precisely such borders as become, in the hands of an enthusiastic person, the receptacles of such floral treasures as he gradually accumulates

from the different nurseries which he visits; they also contain the spoil of many a raid made upon the gardens of friends far and near. Ah! kind country reader, as you have been leaving any large town, perchance in a manufacturing district redolent of smoke, and dust, and other impurities, with all the usual bustle and clamour of a busy crowded community, have you never met a respectable rosy-faced person, not riding but trudging sturdily along with an inexpressible smile twinkling in his kindly eye, his arms laden with odd-looking packages, his pockets bulging out in the oddest manner imaginable, and perchance with his hat awry upon his head? Well, that is the man who treasures such a border, and who occasionally visits you and I, delighting us so thoroughly by his genuine enthusiasm; and we are the guilty parties who send off the good man laden with various odds and ends of no particular value to us, but which to him are veritable gems wherewith to decorate his town home.

The border C is for shrubs, so as to shut out the lower portion of the garden where "J. E. W." intends making his first essay in the cultivation of vegetables. In selecting shrubs for a town garden avoid Conifers. The elegant forms are very tempting, but they soon lose all their beauty in the murky atmosphere of towns. The best shrubs for such a purpose are Rhododendron, Ledum latifolium, Portugal Laurel, Bay,

Mahonia, green Holly, Golden Queen Holly, Berberis Darwinii, E. stenophylla, Aucuba japonica, Cotoneaster Simmondsii, Eucymus latifolius, E. ovatus aureus, E. radicans, and the common Box, with Yucca recurva, Y. filamentosa, and Y. gloriosa. If ornamental climbers are required for the walls take Cotoneaster microphylla, Berberidopsis corallina, Escallonia macrantha, E. pterocladon, Garrya elliptica, Crataegus Pyracantha, Jasminum nudiflorum, J. officinale, Lonicera flexuosa, and Ampelopsis Veitchii.

Vegetable culture should be confined to salads, as Radishes, Mustard and Cress, Lettuce, Endive, Chervil, Tarragon, with such herbs as Mint, Sage, Thyme, Savory, Chives, and Parsley. Two or three roots of Rhubarb might also be added.—EDWARD LUCKHURST.

NOVELTIES IN THE ROYAL GARDENS, KEW.

ENTERING the Orchid house from the new porch, an improvement recently erected, we first notice a fine plant of *Odontoglossum bictoniense*, sending-up several vigorous flower stems that will bloom for months. Underneath are some good masses of *Cypripedium insigne*, which, though common, is one of the best for general cultivation. *Lycaste Skinneri* is represented by good varieties, and is one of the best and finest Orchids for winter-blooming. *Oncidium bracteatum* is curious from its large, dry, and thin bracts; it has yellow and blackish brown flowers. *Liparis pendula* is very graceful from its tail-like racemes of small green flowers. Next is a good variety of *Oncidium crispum*, with *O. excavatum* and *O. obryzatum*. *Odontoglossums* are represented by *O. grande*, *O. cordatum*, *O. Uro-Skinneri*, and *O. bictoniense* before mentioned. *Mesospinidium vulcanicum* is very pretty, with flowers in colour like *Broughtonia sanguinea*. The latter is often found to dwindle from the time of importation; it should be grown on a block where there is plenty of heat and moisture. *Maxillaria setigera* is pretty from its orange flowers; as a rule the genus is not ornamental, though several are worth growing. There are a few interesting *Cypripediums*: the new *C. Roezlii*, named after the energetic collector; *C. pardinum*, *C. barbatum* superbum, and two hybrids, *C. Dominianum* (*C. caudatum* × *C. Pearcei*), and *C. Harrisianum* (*C. villosum* × *C. barbatum*), both obtained by the enterprise of Mr. Dominy. *Calanthe Veitchii* is another hybrid between *C. vestita* and *Limatodes rosea*, also effected by Mr. Dominy, which, with other kinds of *Calanthe*, is very effective. Of *Phalaenopsis* in flower are flourishing plants of *P. amabilis*, *P. grandiflora*, and *P. rosea*. *Dendrobium aequum* has pure white flowers, but is not very free in blooming. *Eulophia guineensis* is very ornamental, and not at all common. The flower stems are erect; the lip is rosy pink, from which the beauty of the plant, and then the upturned sepals and petals afford a distinct character. Of several *Epidendrums*, the most worthy is the ever-in-flower *cochleatum*. It was among the first epiphytal Orchids introduced, and is not yet to be despised, though few cultivators think it of much value. There are two forms, the one much larger than the other. *Brassavola cordata* is ornamental, though, excepting the white lip, its flowers are green. Many others less conspicuous are also in flower.

Dombeya Burgesse is very pretty, flowering in the Palm house. It is allied to *Astrapea*. The blooms are white, with crimson at the base of the petals. The branches sometimes require cutting-in to induce a bushy growth. A stove or intermediate-house temperature is requisite. Cuttings are easily rooted under a bell-glass. Loam and peat in equal parts, with a portion of sand, form a good compost. It is a genus but little known in gardens, several of the species are worth cultivation.

Salvia lantanifolia is used with good effect in No. 4, and being little known we have to recommend it for conservatory decoration, not as surpassing the species already in general use, but as worthy of cultivation for the sake of variety. It has a densely freely branching habit; the leaves are ovate, finely serrated, dark green, and about 3 inches long. The flowers are of a rosy tint, quite different from the scarlet of the three more commonly-grown kinds—*S. Heeri*, *S. gesneriflora*, and *S. splendens*. These and *Chrysanthemums* may be planted out of doors in summer. The cuttings should be struck in spring, so that good plants may be had for planting-out as soon as frost is over. Select a moderately rich piece of ground, if in the full sun so much the better, and let the plants be so wide apart as to allow sufficient room for the watering and staking required to be done. Stopping the shoots must be

attended to. The *Salvias* must be taken up before they can be injured by frost, and the *Chrysanthemums* about the time when the flower buds are forming. Care is necessary, so as to obtain good balls, and injure the roots as little as possible. After potting the plants must be placed in a shady position, and be syringed occasionally; pots must be used as small as the balls will allow. This part of the treatment requires care, or the leaves will drop so as to disfigure the specimens. The practice of planting-out is not perhaps to be recommended as the best system of cultivation, but, when little time and trouble can be given, it will certainly produce the best results. The objection is that the leaves fall after the plants are potted, but with care so few will drop as not to disfigure the plants. Circumstances, however, must always decide the best method of cultivation.

The *Victoria regia* still continues to flower, and is likely to last longer than usual, which may be attributed to mild weather; when cold so much moisture is condensed as to cause excessive drip. In this tank is a specimen of the remarkable and interesting *Nipa fruticans*. It has the foliage of a Palm, and horticulturally may be considered as such; but the fruit is more like that of a *Pandanus*, and to the order of which it is usually referred. In Dr. Hooker's "*Le Maout and Decaisne*" it is constituted a separate order, which is doubtless correct, as it does not accord well either with *Pandanaceae* or *Palmae*, though possessing some of the characters of both. It may be considered as a link between the two. It is of much interest from the circumstance that a similar plant abounds in the tertiary formations at the mouth of the Thames, "where the nuts floated about in as great profusion as here (mouth of the Ganges), till buried deep in the silt and sand that now form the island of Sheppey" (Dr. Hooker's "*Himalayan Journal*"). According to the theory of evolution, if not quite the same as *Nipa*, we may presume it to be the origin of that plant, perhaps contemporary with the monkey stage of man's development! The leaves are tri-natisect, and often more than 20 feet long. Its cultivation is attended with some difficulty. The pot should stand in water at a temperature of 85° to about half way up, and that appears to be the most important point, provided that it has a position in the warmest stove. The soil should consist of good loam without enriching material. The nuts if sent dry in the usual way are most likely to arrive dead, but if placed in the soil of a Ward's case will germinate on the way, and every one may make a plant. They will first require large 60 or 48-sized pots, and must be shifted on as necessary, preferring to perform the operation not later than early summer. It appears to be of much economic value. The leaves are used as thatch, when pounded are applied to cure the bites of centipedes, and a decoction is good for wounds; when burnt they afford a supply of salt. Toddy is extracted from the spathe, and used in various ways. The interior of the fruit also is edible before it is quite ripe. It inhabits the swampy estuaries of the large rivers of India and the Moluccas.

SOUTH ESSEX CHRYSANTHEMUM SOCIETY.

THE sixteenth Exhibition of this Society was held in the Town Hall, Stratford, on the 14th and 16th inst. As usual, the specimen plants were a marked feature in the Show, but were confined principally to three exhibitors—viz., Mr. D. Donald, gardener to F. G. Barclay, Esq., of Leyton; Mr. Simmonds, gardener to Alderman Finnis, of Wanstead; and Mr. J. Douglas, gardener to F. Whitbourn, Esq., Loxford Hall, Ilford. The best large-flowered specimens were sent by Mr. Donald. Mr. Simmonds had some very neatly-trained examples, and his foliage was very healthy. Those from Mr. Douglas had flowers of rather better quality, but the training and the foliage were not so perfect, so that the Judges after much deliberation placed the collections equal.

The Pompon section was well represented. Mr. Douglas was placed first here, Mr. Simmonds second, and Mr. Donald third.

Decorative plants from Messrs. Donald and Douglas, and fruit from Mr. Douglas, helped to give variety to the Exhibition, which was weak in one point this year—viz., cut flowers; all the growers complained that their blooms were over. C. Saunderson, Esq., of Victoria Terrace, had the best blooms, and these were remarkably fresh and of large size. Mention must also be made of the neatly-trained well-flowered standards, both of the large-flowered and Pompon section, sent by Mr. Rainbow, of Clapton, and to which first prizes were in each case awarded.

MILDNESS OF THE SEASON.—I have now ripe Strawberries in my garden without the slightest protection; the plants are

also in blossom. On November 12th I picked ripe Raspberries. —SUTTON ABBOTT, *Wanstead, Essex.*

ROOT SHOWS.

MESSRS. SUTTONS'.—As I have for the last two or three years chronicled the particulars of this ever-advancing Exhibition, it may not be uninteresting to the readers of the Journal to know something about that which was held at the greatly-enlarged premises of the Reading firm on Saturday last; and if the idea crosses the mind of any of our readers that Mangolds and Swedes, and Kohl Rabi and Turnips, have more to do with the agriculturist than with the horticulturist, let me add that in addition to these there was such a collection of Potatoes and garden vegetables, especially of the former, as I have not seen for many a day; in fact, I doubt if so fine a collection of the "noble tuber" has ever been put on the exhibition table.

After the very lengthened drought which we have experienced this year one might have expected that the Show would have fallen short of some of its predecessors; but so far from this being the case, it was in advance, nearly nine thousand roots being staged; and although in some things the roots were not so large as formerly, there was a perfection of form and symmetry about them which more than compensated for the lack of size, although we can hardly speak of lack of size when some of the roots of Suttons' Long Red Mammoth Mangold weighed upwards of 40 lbs., and Swedes weighed 21 lbs. When one handled some of the roots one saw their excellence—the Swedes with hardly any neck, and the Mangolds so clean and devoid of those hard and woody parts which are uneatable. The roots which would, I think, most please an ordinary observer, and I am not quite sure but the farmer also, were those of Suttons' Golden Tankard Mangold, of which there were thirty entries. The flesh of this sort is a bright yellow, and is very nutritious; but on examining those in the prize collections it was noticeable how thoroughly useful it must be, the root being the same size at the bottom as at the top, and thus producing of necessity a larger quantity of food per acre, and a larger quantity of good profitable matter. I have already alluded to the size of the Show, let me give here the number of entries in some of the classes. Of Suttons' Mammoth Red Mangold there were eighty entries; of Suttons' Berkshire Prize Yellow Globe, seventy-five entries; and of Swedes eighty-seven entries, for one collection of which a silver cup, value ten guineas, was awarded.

And now to come to what is more strictly garden produce. There were fifteen collections of vegetables, and of Potatoes no less than ninety-eight entries, divided into three classes—twenty-five collections; forty-five of Red-skin Flourball, and twenty-five of Hundredfold Fluke. It may give some idea of the excellence of the vegetables when I say that Mr. Pragnell, gardener to G. Wignfield Digby, Esq., of Sherborne Castle, who generally takes so prominent a position at our metropolitan exhibitions, only took a third prize, the first, a handsome silver cup, being taken by Mr. Tegg, gardener to John Walker, Esq., of Bearwood. A more beautiful collection it would be difficult to imagine. Specially noteworthy were the roots of Suttons' Beet, one of the finest, if not the finest, variety in cultivation, and the Brussels Sprouts (Suttons' Matchless Improved), which were the perfection of what the vegetable ought to be.

The Potatoes were grand; and if any doubt existed as to the value of the two varieties which the Messrs. Sutton have sent out and laid so much stress upon—Red-skin Flourball and Hundredfold Fluke, it must have been dispelled by the appearance of the Show-room. As to the former, its immense cropping qualities and its comparative freedom from disease must make it ere long *par excellence* the cottager's Potato; and I do not know any better way to benefit our cottagers than by dispersing this variety amongst them. It has quality as well as size, but the cottager generally looks on this as a secondary matter. The collections of Potatoes shown by Mr. Wildsmith, gardener to Lord Eversley, who gains the five-guinea silver cup, and by Peter McKinlay, Esq., of Beckenham, were most beautiful specimens of culture; the Yorkshire Heros of the former exhibitor were especially fine. Of all the American Potatoes I must give the palm to Snowflake, which I think is destined to take a good place amongst our growers; it is large, of good quality, and a capital cropper. Of other varieties exhibited there were Rector of Woodstock; Bresee's Prolific and Suttons' King, which, with all due deference to the Chiswick authorities, are not the same; Lapstone, Model, a very beautiful Potato; Ashleaf, Climax, and other well-known varieties. Altogether the Messrs. Sutton may be congratulated on an Exhibition which shows the growth of their own business, and the public may be congratulated on the fact that such opportunities are given to them of seeing what the gentry and farmers of England are doing to keep up that supply of root food which is so essential to us as a meat-eating people.—LE ROI CAROTTE.

MESSRS. CARTER & CO.'S.—This was held at the Agricultural Hall, Islington, on the 20th inst., and some idea of its extent

may be formed when we state that it occupied the whole of one of the long galleries of that large building; moreover, the roots were not extended in single line, but were placed in several lines four and six deep. The past season is so well known to have been unfavourable to root crops—some of which, as Turnips, have been sown and sown again—that we need hardly mention the fact, but the number of entries, and the size and quality of the roots, were surprising. Gardeners, as a rule, have not much to do with Mangold, and Swedes, and cattle Turnips, but to every man the success or failure of such crops is a matter of vital importance, regulating as it does in a very large degree the price of that expensive article, butchers' meat. It is, as our correspondent has just remarked, of essential importance to us as a meat-eating people. The rage at present is all for size, but it is to us a question whether in many cases smaller roots, indeed a less produce per acre, may not yield a greater amount of nutritive matter than when roots and produce are larger. This, however, is a matter which can only be determined satisfactorily by the analytical chemist, and in the meanwhile we are content to take bulk and cleanness of roots as our guides to judge of their quality.

Messrs. Carter had in their schedule twenty-three classes divided among Swedes, Mangolds, Turnips, Carrots, Kohl Rabi, and Potatoes. Carter's Imperial Swede, a bulky variety, was numerous and well represented; whilst of Improved Mammoth Long Red Mangold gigantic specimens were shown, the half-dozen which took the prizes for size weighing collectively 246 lbs. The other varieties of Mangold were Warden Prize Yellow Globe, Intermediate, New Sandringham, New Yellow Tankard-shaped, Red Globe, and Long Yellow. Of the Intermediate some of the roots weighed from 30 to 31 lbs., and some came from Lord Warwick's sewage farm, where the produce was stated at 84 tons per acre. The Turnips were exceedingly well formed and good, and there were, besides, several collections of very sound well-grown Potatoes.

THE PELARGONIUM SOCIETY.

The following prizes will be competed for at South Kensington, July 21st, 1875, by permission of the Royal Horticultural Society, and subject to the regulations issued by that Society.

Class I.—Twelve distinct varieties of Zonal Pelargoniums, "florists' class," in pots of 8 inches in diameter. (Open.) First prize, £8; second prize, £5.

Class II.—Twelve distinct varieties of Zonal Pelargoniums, "decorative class," in pots of 8 inches in diameter. (Open.) First prize, £8; second prize, £5.

Class III.—Thirty distinct varieties of Zonal Pelargoniums, "irrespective of class," in pots not exceeding 6 inches in diameter. (Open.) First prize, £6; second prize, £4.

Note.—The varieties to be shown in the above classes are to be of the flowering section—not those with variegated leaves. Class I., designated "florists' class," is intended to include only those varieties which have finely-shaped flowers, according to the florists' model. Class II. is intended for profuse-flowering, showy varieties, otherwise known as Hybrid Nosegays.

Class IV.—Six ornamental Cape Pelargoniums, dissimilar. (Open.) First prize, £3; second prize, £2.

Class V.—Best Hybrid Pelargonium, of distinct character. (Open.) First prize, £2; second prize, £1.

Class VI.—Twenty-four Pelargoniums, cut blooms, single trusses, dissimilar. (Open.) First prize, £2; second prize, £1.

Class VII.—Twelve Pelargoniums, cut blooms, single trusses, dissimilar. (Amateurs.) First prize, £2; second prize, £1.

Note.—The Judges may in their discretion, and subject to the approval of the Committee, award a prize to any exhibit worthy of particular notice, which may not be provided for in the schedule. They may also withhold any of the above prizes if the exhibit be not of sufficient merit.

Conditions of Competition.—It is imperative that every variety exhibited shall have conspicuously appended to it, its own name, together with that of the raiser, such names to be either printed or distinctly written on a card.

The "Chiswick standard" to be adopted in regulating the size of the pots—that is, "8-inch pots" measure 8 inches across and 8 inches deep inside, at a point 1 inch below the top edge; 6-inch pots in like manner measure 6 inches deep and 6 inches wide inside, at an inch below the edge.

The Society proposes to accomplish these objects:—

1st, By offering liberal prizes to be competed for by British and foreign exhibitors, and thus to afford raisers and cultivators an opportunity of forming an opinion as to the merits of new varieties, and to give the general public the means of judging the decorative value of these plants under superior cultivation.

2nd, By determining the merits and distinctive qualities of new varieties, and their suitability for conservatory decoration or bedding-out purposes, or both.

3rd, By cultivating all new varieties, British or foreign, side

by side, and in conjunction with approved old kinds; during the first year under glass, and out of doors in the second year.

[With reference to this point, the Society has reason to think that opportunities for carrying out these tests will be afforded by the Royal Horticultural Society at its garden at Chiswick.]

4th, By the formation of a register in which approved sorts shall be entered, and from which inferior varieties shall be eliminated.

[In conjunction with this register, it is hoped that an accurate report of the means adopted, and of the results obtained, in the process of hybridisation, may be kept, for the purpose of comparison and scientific study.]

5th, By facilitating intercourse and interchange of opinion between raisers and cultivators.

It may here be remarked that the Society has already taken steps towards securing the due recognition of the labours of those to whose skill and patience we are indebted for improved varieties, by stipulating in its schedule that the name of the raiser be affixed to every plant exhibited—an act of simple justice, worthy of adoption in all similar cases. The Royal Horticultural Society also suggests the adoption of this recognition in clause vii. of rules attached to its recent schedules, but in lieu of a suggestion it should be made "a condition" in offering the prizes.

SOME OF THE VEGETABLE PRODUCTS OF CEYLON.—No. 2.

COTTON.—A considerable quantity of native Cotton was grown in Ceylon some years ago, and manufactured in the island, but not, to the best of my knowledge, exported. Small quantities are still produced in the western, north-western, and eastern provinces, and manufactured into native cloth. The importation of Manchester goods of late years from England has led to a considerable diminution in the Cotton produce of the island.

An admirable *brochure* on the condition of Cotton cultivation in Ceylon, with suggestions for its extension and encouragement, by Mr. James Augustus Cailey, F.G.S. (a retired member of the scientific branch of the Ceylon Civil Service), with an excellent map of the Cotton-producing districts of Ceylon annexed, and with tabulated and statistical returns from all parts of the island, was published in Manchester in 1859.

Mr. Cailey states, it has been said that Ceylon does not contain soil suitable for the growth of good Cotton, that the peculiar soil called "regur," in which it is so extensively grown in continental India, and which is generally called black Cotton soil, does not exist in Ceylon. Mr. Cailey is of opinion that such impression is erroneous, and that from personal knowledge, not only is black Cotton soil found in Ceylon, but that it extends over a considerable area, accompanied with beds of kunkur, a calcareous formation found under the same circumstances in Southern India. Mr. Cailey most wisely lays down, as an important element of success, to confine operations in the first instance to those districts of the island which are advantageously situated with reference to shipping ports. He instances the gradual adoption of Coffee cultivation, and that of an improved character, by the natives, supply following demand, as analogous in its action to what would follow in regard to the cultivation of Cotton by the natives if a steady demand existed for all they could bring into the market.

In the published dispatch dated November 27th, 1857, from the able and energetic then Governor of Ceylon, Sir Henry G. Ward, addressed to the Secretary of State for the Colonies, he states that there can be no doubt, from the concurrent testimony of those best acquainted with Ceylon, that a large portion of it, and more especially that which is subject to the influence of the north-east monsoon, is well adapted to the growth of Cotton; that the plant thrives there naturally in its wild state; and that with a very small amount of care Cotton of a very fine quality may be produced; that large tracts of land might be found susceptible of irrigation from their vicinity to some of the ancient tanks, the water in which might be rendered available at a comparatively small expense. Sir Henry concludes his dispatch by urging that what are required to insure the success of a Cotton plantation in Ceylon are one or two practical men acquainted with the best modes of raising Cotton, bringing out the best seed, and selecting for themselves, with the advice of the officers of Government in Ceylon, the most favourable sites as regards climate, population, soil, and access to the coast; that all these requisites might be found within a reasonable distance from Trincomalee. Labour might be procured from Jaffna at a very reasonable rate, wages

in that province not exceeding fivepence a day.* If periodical irrigation be required there is an inexhaustible supply of water in the tank of Kandelly, which might be rendered available at any point between it and the sea, and in this manner in two years, with a capital of £10,000, under proper arrangement, results might be obtained which would probably lead to investments upon a much larger scale, and end by rendering the Cotton of Ceylon as well known in the manufacturing districts as its Coffee is now.

My friend Dr. Thwaites, the accomplished Director of the Royal Botanic Gardens in Ceylon, considers that some good results would follow (he held that opinion some time ago), if the indigenous Cotton of India were improved by hybridising or crossing the native kinds with the Bourbon, Sea Island, and New Orleans varieties, the same plan being adopted and the same precautions observed that are taken in crossing valuable flowers and fruits with such signal success in Europe; and that if the experiment should not end in so favourable a manner as could be desired, a problem of very great interest would have been solved as to the affinity which the several varieties of Cotton bear to one another. If by these experiments it should be found that real progress had been made towards improvement of the native Cotton, the system of crossing might be still further carried out, using the plants of the already improved stock instead of those of the original native kind for crossing upon, and this operation might be carried on for several generations of plants, until the maximum improvement should be considered to have been realised. I have always held the opinion† that, in new articles of export the interference of the Local Government up to a certain point—namely, until the cultivation and export of such new articles had been proved to be a financial success, was legitimate and highly advantageous to the colony.

When representative of the Crown in the central province I drew up a report for the Kandy Agricultural Society, of which I was President, which was submitted to the Ceylon Government, in which the Society expressed their hope that the Government would be pleased to request the active co-operation of its agents in regard to the general subject of Cotton, and that it might, perhaps, be thought advisable to encourage so valuable a product by permitting and encouraging the inhabitants of districts favourable to its growth (and there are thousands of acres well adapted for its cultivation) to pay for a certain period a portion of the taxation due by them to Government in Cotton; the rate at which it was to be received to be fairly adjusted, and the Cotton so received to be sold in the colony, which might be done without difficulty, to any of the mercantile island firms. This procedure was some years ago adopted in the case of plumbago, and if sanctioned in the case of Cotton might be strictly limited to a period which would admit of the experiment as to the character and value, and if any impetus were given thereby to the further cultivation of this valuable article being fairly tested.

The adoption of this recommendation as to Cotton by enlisting the native population in its cultivation—and patches of suitable land in the immediate vicinity of their villages might be most advantageously and economically cultivated with Cotton by the labour of their own families—would, I am sanguine in believing, lead to the appearance of Cotton as an item of some amount in the exports of Ceylon. With the introduction of additional labour from the continent of India and of Chinese (for I have been ever the advocate for the introduction into Ceylon of the latter industrious class, not to be taken from the rabble of Canton and other large towns, but from "that great nation of labourers behind the coast," as described by Mr. Fortune, than whom there exists no more trustworthy and practical authority), Cotton estates might be also opened, in localities suitable in reference to soil and climate, with great advantage by European colonists.—E. RAWDON POWER, *Ceylon Civil Service (Retired), Tenby, South Wales.*

VEITCH'S SELF-PROTECTING BROCCOLI.

WE have had brought to our notice one of the most perfect self-protecting Broccolis it has ever been our fortune to meet with. So thoroughly self-protecting is it, that the beautiful

* This is not the case, I apprehend, in Jaffna (northern province of Ceylon), at the present time, as there exists a greatly increased demand for labourers, and their rate of pay has been thereby augmented.

† In my article on the Cocoa-nut, in the number of the "Food Journal" of February, 1873, I alluded to the successful action of the Local Government in reference to the production and export of Cocoa-nut oil from Ceylon.

white head is hidden as completely in a mass of foliage as the proverbial needle was in a bundle of hay. One has literally to hunt for the head, and when it is found it is the model of what a head of Broccoli ought to be—even and solid, of perfect colour, and not more than 4 to 5 inches in diameter—just such an object as families of refinement would like to see on their table. We hope that Messrs. Veitch will in other vegetables, as they have in this, take the lead in the introduction of a class which shall serve more as an ornament to a gentleman's table than many of the novelties which have been offered to the public of late years.

GARIBALDI STRAWBERRY.

I READ Mr. Wright's article relating to the above Strawberry, mentioning as a curiosity the gathering of ripe fruit from the open air in October. I gathered here on the 13th of November a nice dish of ripe fruit of the above-named Strawberry from the open air. I may here state the plants form part of a plantation of several years' standing, as some may be led to suppose they were some of those forced in the previous spring, and which are known to produce a second crop late in the season.

In consequence of our family being absent for a few days I had deferred gathering the fruit, or else two or three days previous to the 13th I might have gathered many more, but the feathered tribe deprived me of them. I did not indulge myself in tasting them, being anxious to send every one to table, treating them quite as a luxury at this season of the year; but Lady Devon informed me to-day that they were very sweet, and possessed a flavour nearly, if not quite, equal to those of early summer production. At the present time the plants are laden with fruit, many of them having attained a full size, and the crop would not fail to give satisfaction in the ordinary Strawberry season. If the weather prove mild I have not the least doubt but that I shall be able to gather more ripe fruit for some weeks hence. Last night I had several of the best of the plants bearing the most promising fruit protected with hand-lights, which perhaps may assist me in my expectations.—D. A. POWELL, *Powderham Castle, Exeter.*

WHICH IS THE OLDEST CEDAR OF LEBANON IN BRITAIN?

AMONGST my scraps is the following in my handwriting, but no note of whence it is extracted:—"At Bierley Hall, three miles of Bradford, Yorks., on the lawn stands a Cedar of Lebanon (*Cedrus Libani*), which, if not the first, was certainly one of the earliest introduced into this country. London gives 1683 as the date of its introduction, on the authority of Barrelier, a French botanist of 1714. Dr. Richardson received the Cedar, along with some others, a seedling, as a present from his friend Sir Hans Sloane about 1700, it being planted in a greenhouse under the impression that it would not thrive in the open air; but after a time it was transplanted to the place where it now stands, in a smoky atmosphere, but still the admiration of all who know its history. The greenhouse in which the tree was planted was the second hothouse (so called) ever erected in England, and by the same workmen who erected the first at Orford, near Liverpool. Dr. Richardson resided with the eminent botanical professor Paul Hermann three years at Leyden."

Is the tree still living or standing? If so, is there an older one or one so old existent in Britain, and where? What are its dimensions?—G. ABBEY.

FLOWERS FOR OUR BORDERS.—No. 44.

SALPIGLOSSIS SINUATA COCCINEA.—SCARLET SALPIGLOSSIS.

THE singular variety of colour afforded by the different forms of *Salpiglossis sinuata*, a variety hardly equalled by any other genus in cultivation, has enabled this plant to retain its place in popular estimation, notwithstanding the very considerable number of more recent introductions in the class of annual plants. But for one rather serious defect the Salpiglots would unquestionably take even higher rank: we allude to their height, which renders them less fitted for small masses or beds than many dwarfer but less showy plants. It is true that so-called dwarf varieties have been raised, and are annually offered in the seedsmen's lists, but the difference between these and the older varieties is less marked than could be wished,

and much remains to be accomplished in perpetuating a strain of these elegant annuals of decidedly dwarf habit.

Of the numerous distinct shades of colour in which *Salpiglossis sinuata* occurs, none are more pleasing than coccinea. In its general habit and characters it resembles the other varieties; like them attaining a height of $1\frac{1}{2}$ to 2 feet, with erect branching stems clothed with clammy hairs. Its colour is "a clear vivid tender scarlet," relieved by darker veins of the same tint.

Its cultivation is precisely that of the other varieties. The seeds require the aid of a hotbed, and are best sown in March in pots of light sandy loam: they should be thinly distributed, and as soon as the seedlings are an inch or two high abundance of air should be admitted if the weather is sufficiently mild to allow of it, for the Salpiglots are by no means tender, and will not bear "coddling." When the young plants are large enough to handle without injury they may be transferred in small patches to larger pots of light, rich, but well-drained soil. If, however, the seedlings have come up thickly, they

Fig. 133.—*Salpiglossis sinuata coccinea*.

will need transplanting separately, or thinning-out. In either case they should, when repotted, be returned to the hotbed, and be kept closed for a few days; after which, about the end of April, they may be placed in a cold frame, and gradually hardened off before planting out in May. A light rich soil, composed of a little leaf mould and thoroughly decayed manure mixed with sandy loam, suits them best. They form a very beautiful bed where the massing system is adopted, but are equally valuable for planting in clumps in the mixed borders, and will flower through the summer.

In favourable localities the Salpiglossis may be treated as a hardy annual, the seed being sown in the open border in April, and sturdier plants will be thus obtained, which will, however, bloom somewhat later than those raised under glass.

The Salpiglots are all natives of Chili.—(W. Thompson's *English Flower Garden*, Revised by the Author.)

GRAFTING THE PEAR ON THE MOUNTAIN ASH.

PERMIT me to relate my experience in grafting Pears on the Mountain Ash stock. I find the scion and stock unite generally well. Owing to bad seasons, &c., I have not had much opportunity of judging of the fruit of such trees. This year,

however, some have borne well, and the trees seem healthy. I cannot help thinking that the fruit is later in ripening than the same would be on a free or a Quince stock; the fruit seems harder, and altogether not so good. These observations especially relate to Brown Beurré Pears grafted on the above stock. I should add that this locality has a poor gravelly soil, and that the Mountain Ash is indigenous here. The situation is 450 feet above the sea, from which it is some three miles distant, and in a mountainous region.—C. R.

NOTES AND GLEANINGS.

MESSES. DICK RADCLAYE & Co. have brought to our notice a BUDDING KNIFE upon a plan which is quite new, and which it is surprising has not been thought of before. It is well known that in using the ordinary budding knife, after making the cut for the reception of the bud, the knife has to be turned in the hand to open the bark with the point of the handle. In the "Improved Budding Knife," the back of the blade is used for this purpose, and there is, therefore, no need for turning the opposite end of the knife to effect this. It might be an improvement if the handle of this new knife were made a little lighter.

— ONE of the grandest objects, says the *San Francisco Bulletin*, which meets the eye of the traveller in our mountains is the exquisite plant, the Snow Plant of the Sierras—the *SARCOCODE SANGUINEA* of John Torrey the botanist. It is an inhabitant only of the higher Sierras, being rarely found below an altitude of 4000 feet, and its glorious crimson spike of flowers may be seen early in May forcing itself through the snow which at that period clings about the sides of our Pine forests. The portion of the plant which is visible above the soil is a bright rosy crimson in colour, and presents the very strongest contrast to the dark green of the Pines and the shimmer of the snow. Its root is succulent, thick, and abundantly free of moisture, attaching itself to the roots of other plants, principally to the species of the Pine family. Hence it is among those curious members of the vegetable world which are known to botanists as parasites, and is consequently entirely incapable of cultivation. The deer are extremely fond of it, and it is not an uncommon circumstance to find a number of the plants uprooted and robbed of the fleshy part of their underground growth by these animals. It belongs to the natural order *Orobanchaceæ*, and is met with through the whole of the Sierra region, becoming rarer as we approach the south.

— ONE of the pastimes provided for the British soldier in India is that of gardening, and Lord Napier has just issued a resolution on THE HORTICULTURAL RESULTS OF THE PAST YEAR in THE BENGAL ARMY. His lordship is pleased to notice that there has been a considerable increase in the number of soldiers who have taken to gardening during the year, and he is also glad to observe that the regimental gardens in many cases so satisfactorily answer the purpose for which they were instituted, and that they not only supply very considerable quantities of vegetables to the commissariat for issue to the troops, but also serve as a pleasant lounge for the men and their families. The largely increased number of men who now occupy themselves in gardening affords satisfactory evidence of the great interest which has been taken in company gardens during the past year. The only drawback to the success of the gardens has been the quantity of bad seed supplied, but that is to be looked to more carefully in future.

— A COMMITTEE has been formed to obtain funds for a TESTIMONIAL to MR. E. R. CUTLER, Secretary to the Gardeners' Benevolent Institution, and during whose connection with it a great advance has occurred in the Society's usefulness.

— AT the Royal Agricultural Society the Judges appointed to inspect the growth of the six varieties of POTATOES which were entered for competition as disease-proof, and planted in trial plots in twenty different places in England, Scotland, and Ireland, have reported that none of the varieties have resisted the Potato disease. During the period of vigorous growth in all the varieties, in five out of the twenty localities the disease was virulent, and by the end of the season it was found that in almost all these places more or less disease was apparent; so that the question of disease-proof Potatoes, as far as these trials are concerned, has been practically decided in the first year. The note-books of the growers and the reports of the Judges contain much valuable information as to the influence of soil, climate, and various methods of cultivation upon the

action and progress of the Potato disease. The Committee, therefore, recommend that Mr. Carruthers, who has carefully inspected every trial plot, be requested to collate these experiences for publication in the next *Journal* of the Society. The Potatoes which were grown upon the trial plots, after having been carefully examined by the Judges, and the per-centages of diseased tubers ascertained, have been sent to the Agricultural Hall. It is proposed that the competitors shall have the first offer to purchase the produce of their own entries, and that if they, or any of them, decline, the Potatoes shall be sold by auction or by salesmen, as the Committee may determine. It will be remembered that the Council reserved a power to enforce a penalty of £20 in case of the failure of the entries of any competitor to resist the disease, but the Committee recommend that this penalty be not enforced in any instance. Most important communications have been received from Professor De Bary, who has ascertained by recent experiments that the Potato disease is not propagated by infected tubers; that although the mycelium of the fungus (*Peronospora infestans*) was distinctly apparent in the stalks of plants raised directly from diseased tubers, no gonidia or germs were evolved. The Professor remarks upon this curious circumstance that he is struck by this result of seeing the fungus with the naked eye during two or three months in his little field, and all the plants and leaves intact. Professor De Bary, in a later communication, expresses sanguine hopes that he has at last discovered the certain nidus, or resting places, of the oospores, or active primary germs of the fungus, which, as he says, would essentially accomplish its life history; and the great practical results of these discoveries, if perfected, will obviously be that measures may be taken by Potato-growers to avoid planting Potatoes after, or in the immediate vicinity of plants known to be suitable to the development of the oospores of the fungus, or that steps may be taken to destroy them *in situ*. This report was adopted.

CANKER AND SHANKING.

I SEE it suggested in the *Journal* that canker in Apples and Pears arises from poverty of soil. Mr. Rivers, on the other hand, recommends lifting—that is, diminishing luxuriance. My idea is that canker arises from the action of frost upon unripened wood, some varieties being more tender than others; if so, Mr. Rivers is right. I had a plant of his Winter Beurré, which cankered, but having heard that it was much valued at Bordeaux, I placed it against a wall, and it now grows well. But, of course, one experiment is not proof.

I wish some of your correspondents who have grown Frontignan Grapes in the open air, would state whether there is truth in the assertion that under such circumstances shanking is unknown. If it be a truth it shows the fallacy of the received opinion that shanking arises either from bad roots or from overcropping, since Vines under glass, if not planted outside, soon find their way there when they can, and there is no reason to suppose that outdoor Vines are less cropped than indoor plants.—G. S.

NOTES ON VILLA AND SUBURBAN GARDENING.

As a rule amateurs are very fond of their gardens, and I well remember once hearing one of them say, that if there was one thing more than another that he had striven to gain a knowledge of, it was that of forcing *Sea-kale*, *Asparagus*, and *Rhubarb*; there was so much gratification at the result of his efforts, not only because he was successful to a degree which surprised him, but because he was able to enjoy a dish of these delicious vegetables from his own garden fresh and good. Now his garden, to my knowledge, had no walls, but was encircled by hedges, and close to a large town; it had an aspect facing south, and being in the shape of a parallelogram running east and west, there was an advantage taken of its position to shape out a border under the hedge of the northern boundary, and upon this border, among other things, grew the above-mentioned vegetables in patches suitable in size to the requirements of his family. The ground was deeply trenched and manured, spaces for each sort were allotted, and in the autumn the planting was carried out. The *Sea-kale* and *Rhubarb*, as well as the *Asparagus*, were purchased of a respectable nurseryman. The first was planted in rows 18 inches apart, and 6 inches from plant to plant. This to many may appear very close, but the roots were intended for forcing, and, therefore, not to be long where they were growing. The *Rhubarb* was also planted in rows, but 3 feet apart, and 2 feet from plant to plant; the *Asparagus* 1 foot from plant to plant, but in rows 18 inches apart. They were all

well attended to during the spring and summer, and well and frequently watered, and other attention paid to them, so as to encourage the most luxuriant growth possible, and I need scarcely remark that the plants quickly established themselves, and formed most excellent roots, as well as matured some well-formed crows, which was the object aimed at in order to carry them through the severe ordeal of forcing.

Having a large three-light deep frame standing on a foundation of bricks just rising out of the ground sufficiently to protect the wood of the frame from sinking into the earth and rotting, and keeping a horse as very many amateur gardeners do, there was an opportunity of making manure, which was collected from the stable from time to time, and other materials, such as refuse vegetables, were mixed with it. When sufficient had been obtained to make up a bed, and through lying some time the rank heat had passed off, the whole was thrown into the three-light frame, well shaken up together, and when the heat had risen up so high that there was no fear of its becoming stronger, a bed of common garden soil was put over it to the depth of a foot; when this had become mildly warm the plants were put into it, one light being devoted to each kind of vegetable, and as the planting went on more earth was added to those roots that could not find depth enough without going down into the manure. I ought to say that after the bed was made up each light was partitioned off by placing boards under every rafter inside of the frame, so that each vegetable might be more easily treated according to its requirements, so as not to interfere with its neighbour. All was well watered after the soil had been properly placed round each root as it was planted, and I may say that they were planted thickly, but not all of the same height; for instance, the Rhubarb, which throws up large stems and leaves, was planted lower than either of the others in order to allow it the necessary room.

After all was done a trial stick or two was thrust into the bed in each light, and the whole frame shut up and covered over with mats to keep out the light. At intervals of a few days the bed was examined, and the heat ascertained by the trial stick. In the meantime the collecting of heating material was going on, and when the heat of the bed was going down this was applied as a lining to the outside. When the plants began to make growth a little air was given in mild days or when the heat was too strong, and which I may say ought not to exceed 60° at any time. Air was given night and day, but not in such quantities as to lower the temperature perceptibly. In order to well blanch the Sea kale it was always kept dark, but the Rhubarb and Asparagus were gradually inured to the light so as to have them of their proper colour and flavour, a precaution many do not take, but which would be an improvement, for anything that can be forced and brought to its natural colour approaches more nearly its natural flavour. If preferred otherwise they will grow as well, but not possess their natural qualities.

Whenever either of these vegetables appears likely to grow faster than what is needed for consumption, the growth may be modified by giving a little more air, though the temperature ought not to fall below 50°. All of it will not come at once, and if properly managed as above directed the produce will continue and gradually come in and last a considerable time; and the best of this plan is, that when the bed for either sort is exhausted it may be taken out and renewed, and fresh plants put in, and so continue until the season is advanced, so as to produce the same things outdoors naturally. There are many amateurs who may do as this enthusiastic person did, and reap the benefit of their own labour, and that is my reason for giving details.—THOMAS RECTOR.

THE BEAUTIFUL AND USEFUL INSECTS OF OUR GARDENS.—No. 27.

Owing to the mild weather we have had in October and in part of November, and also through the absence of those drenching rains which occasionally about this season play ad havoc with the flower beds, we have observed in many places a particularly fine display of autumn blooms: hence insects of diverse species just about this time are glad to desert the barren prospects of the fields, lanes, and woods, and seek supplies of honey from the flowers of the garden. Both by day and by night during November we see these passing hither and thither on the wing, the day visitors being mostly bees, flies, and butterflies; the night ones different species of moths. The ghostly way in which some of the moths appear and disappear in the twilight is rather startling to certain nervous people, and sometimes a slightly-bewildered individual, whose supper has been too much for him, may strike against your face as you walk along a path. Though you know there is nothing to be alarmed at, it is not surprising if the peculiar feel of the moth's furry body gives you a start for the moment. Had it been an autumn-prowling beetle—for such are still abroad—his hard wing-cases and bristly legs would have made

his presence manifest. Not a few of the moths one sees abroad at night, and which belong to the large group of the Noctuidæ, have eyes which glitter at night with a luminosity which has not yet been accounted for. I can hardly, for my part, regard it as being of a phosphorescent character. When an entomologist seizes one of these, and beholds it roll towards him its "fiery orbs," who can wonder if he hesitates a little ere he drives a pin through its body, or immures it in the stiding box from which no prisoner comes forth alive? Moths, as I have observed, resort to the flower beds of autumn almost throughout the month of November, unless the weather prove severe enough to force some to their winter quarters, and cut off the lives of the rest. Should some wall or tree in the garden be graced (or disfigured?) by a growth of Ivy, this plant proves a superior attraction even to the flowers of the conservatory. The honey its singular-looking bloom affords has a retinue of admirers and eager sippers, until it is positively exhausted. One still sees this plant allowed to grow freely, though most gardeners of the old and new schools agree, for a wonder, in its condemnation, some regarding it as a covert for insect pests of various kinds, some also going so far as to assert that it diffuses a peculiar aroma or influence not exactly describable, which is hurtful to other plants growing near.

Two monster moths should have been mentioned before, which seem to have a liking for the garden precincts. They form the half of the genus *Catocala*, as known in Britain; the other two, familiarly called the "Crinsons" by collectors, are principally taken in Hampshire by the attractions of sugar. The moth which has received the not-very-appropriate name of the "Clifden Nonpareil," (*fig. 134*), also occasionally called the Great Blue Underwing (*C. Fraxini*), is of great, and perhaps it might be said inexplicable, rarity, since there is no obvious reason why it should not be as abundant as its relative *C. nupta* (*fig. 135*). For once we cannot accuse entomologists of having-hunted a species down, since it appears to have been always scarce. It is certainly puzzling when solitary specimens of so large a moth turn up, for it is a natural conclusion to draw that where there is one of a species there ought to be more. In the case of *C. Fraxini* we have a long list of single captures, several of these having been made near London, as at Hammersmith and near the Regent's Park. Some hint that a moiety of these records are open to suspicion, seeing that the moth can be got from France or Germany for a shilling, while the value of a *bona-fide* Britisher may be £2 or £3. So much for the fancy. The grey upper wings of this species, though pleasing to the eye, are not particularly remarkable; the distinctive markings are on the lower pair, which are black, with a band of blue or bluish grey and a narrower marginal band of white. On the Continent the caterpillar is stated to feed upon fruit trees—not, however, to an injurious extent, and also on the Poplar and Ash. Mr. Newman considers it presents a curious example of mimicry or seeming resemblance, as it is furnished with a series of small fleshy appendages on the sides of the body, which resemble the rootlets of Ivy, and give to the whole caterpillar the appearance of one of the twigs of that plant resting on a branch. The colour also agrees, as this is usually brownish grey with a few specks of a deeper tint. It is also remarkable for having an additional segment to its body beyond the average number. The Red Underwing (*C. nupta*) I have frequently seen sitting on palings near London, with the colour of which the grey upper wings harmonised capitally. At other times individuals will be seen on trunks of trees. It is not by any means a timid species, and I once noticed one of these moths by a rather bustling roadside near Brompton. The narrow winding lane which runs along the side of Holland Park, serving as a footway between Kensington and Netting Hill, used to exhibit *C. nupta* sometimes a few years ago. Though in passing along the lane persons would come near to the palings they would rarely perceive a moth reposing thereon, so little observant are the majority of passers-by. Mr. Newman thinks the caterpillar feeds on the Crack-Willow chiefly (*Salix fragilis*); but I do not believe the species grows in that locality, and imagine that several species of Willow and Poplar are resorted to by the parent moth when depositing eggs.

This caterpillar much resembles that of *C. Fraxini*, differing, however, in having two irregular stripes extending along the back. During the day it clings to the bark of the tree with the head pressed down, and it is difficult to remove it without injury. Towards evening it moves towards the branches to feed. The cocoon is spun amongst the leaves, or placed within a cavity, in June or July. This is of a slight

texture, and allows the chrysalis to be seen, which is covered with a mealy substance of a purple colour. The moths of both *C. Fraxini* and *C. nupta* quit the chrysalis in August and September. This autumn I saw individuals of the latter species in October, later than the average; the caterpillars were probably retarded in the spring. In wet weather one of these moths will now and then creep into a conservatory, when its "autumn manoeuvres" at dusk soon deprive it of its beauty by its collisions with the glass. Other moths may be specified that are actually November visitants, some of them elegantly marked, and some meriting the adjective "beautiful." In some sombre hues prevail, which seem to agree with the dullness of the season. Thus, we may see about the Ivy, or on flowers at night, the moderately-sized moths called the Red-line and the Yellow-line Quaker (*Orthosia lota* and *macilenta*), quite models of Quaker-like propriety in garb, if not so quakerish in abstemiousness, for they have been noticed feeding greedily on the luscious droppings from the berries of the Yew. The latter species is notable for having a very beautiful caterpillar of a rich brown, studded over with small points, and with five longitudinal stripes. It has been taken on the Beech. The Dark Chestnut, an allied species (*Cerastis spadicea*), is still more sombre than the Quakers. Sometimes the caterpillar is found on Honeysuckles, more usually on low plants.

Fig. 134.—*Catocala fraxini*.

The Dotted Chestnut (*Dasyampa rubiginea*) is one of those moths, formerly of great rarity, now gradually becoming commoner, though still viewed as a prize by the insect-hunter; and it obtains its value partly from its beauty, since the markings are both singular and handsome. The vernacular name gives us an inkling of these, the Chestnut in some specimens savouring of reddish, and in others being purely brown; the dots are black. As the hairy caterpillar is found on the Apple, and also on the Oak, according to some, the species is likely to occur about orchards, and, like the "Quakers," it is susceptible to the attractions of Yew and Ivy. In Ireland the moth is said to be more widely distributed than in England. A rather more showy moth, taken at rest by day in gardens during October and November, is called by the ridiculous name of the Gray Shoulder-knot (*Xylina rhizolitia*); after dark it moves off to obtain sweets, and is often netted by the entomologist at his sugary snares. The grey wings are relieved by a commingling of black spots and wavy lines of the same colour; the head and thorax are much lighter in colour than the body. In the spring some, if not all, of these moths reappear to deposit eggs, a circumstance not uncommon among the autumn species. The pale green caterpillar feeds on the Oak, and probably on the Lime in gardens and parks.

In the last months of the year, individuals of the December Moth (*Pecilocampa Populi*) emerge from the small black cocoons constructed by the caterpillars of the species upon the trunks and branches of trees. The life in the chrysalis condition is liable to be remarkably prolonged. It is not unusual for two years to elapse, and there have been cases where moths have come out four or five years after the spinning-up of the caterpillar. This is obviously a natural provision to guard against the destruction of a species which comes forth in the imago state during a season of the year when unfavourable

and ungenial weather often prevails. The moth is suited in its garb to the winter, having smoke-coloured wings crossed by pale wavy bars; the head, thorax, and body are also smoky brown. The beauty in this species shows itself in the caterpillar stage; these gaily-coloured creatures which take especial delight in basking in the sun, showing themselves during the day on the trunks of Oak, Poplar, Lime, and other trees; but they are not sufficiently numerous to do harm in our plantations. The colours are a commingling of black, gray, yellow, and white, while from the sides of the body grow bunches of long hairs. A theory has been propounded that these colours become modified so as to suit the varied tints of the bark and lichens of the trees. The moth has, like others of the family of the Bombycina, no *penchant* for sweets natural and artificial, and though it hides in nooks about gardens, it visits

Fig. 135.—*Catocala nupta*.

these chiefly because they afford better shelter than the country when bare of leaves. Or it will, of course, sometimes happen that the caterpillar has fed-up on a tree close at hand, or within the garden boundaries.—J. R. S. C.

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT AND KITCHEN GARDEN.

THE work is much the same as that detailed for the last two weeks—digging borders, trenching kitchen-garden quarters, and, above all, seeing that everything is neat and even. Though plenty of rough work is being performed, it is just as well not to let everybody know it by the confused state of the garden. We shall prepare the ground for Carrots directly, as without special preparation a crop of decent roots cannot be obtained. The ground is trenched about 18 inches deep, at the bottom of the trench a layer of manure is placed; the new earth from this depth being turned-up on to the surface is free from any maggots or grubs, and as a rule large sound roots are obtained.

ORCHARD HOUSE.

Our practice of turning the trees outside for a few months entails more labour than if they were allowed to remain under glass. At present the trees are plunged to the rims of the pots in cocoa-nut fibre refuse, and a quantity of the same material is at hand to place over the surface of the pots. Should a severe frost set in, it is just possible that in wet districts Peach and Nectarine trees in pots would suffer from being turned out in the way they are treated here. Wet would certainly be more injurious to them than frost. For instance, a Scotch paper gives the rainfall for October in a certain district of Dumfriesshire as 12 inches; our rainfall during the same period is not a fourth of this amount. It is clear from this that if the readers of these "Doings" scattered over the United Kingdom are to be benefited by the perusal, they must take all the surrounding circumstances into consideration. If the trees are in good condition, and making progress, the young rootlets will be penetrating the top-dressing, and will grow freely into the cocoa-nut fibre placed over the surface.

The Chrysanthemums contained in the house have flowered rather earlier this year, and will be removed at least ten days

earlier. The pot Strawberries have been removed to the shelves in the orchard house, and they are in capital condition, neither having suffered from too much rain or from frost. The pots were standing upon a dry bottom out of doors, and freely exposed to sun, wind, and rain. Our own belief is, that the longer the plants remain out the better are the crowns matured. The leaves are also quite green, and more healthy than if the plants had been removed under glass a month previously. As the pots were standing on a bottom of bricks no worms could find their way in; if they do, in all probability they will choke the drainage. Worms can be removed from the pots either by turning the plant out, or watering it with clear lime water, when the worms will come to the surface and die, or they will die underground. If the pots are dirty they should be washed, as not only are dirty pots an eyesore every day, but the plants will not thrive quite so well in them as they will in clean pots.

MUSHROOM HOUSE.

This structure will now be useful not only in supplying Mushroom, but also for forcing *Sea-Kale*, *Rhubarb*, *Chicory*, &c., for salads. A good temperature is 55° at night, and there may be a little rise by day owing to the higher outside temperature in the daytime. A succession of *Sea-Kale* and *Chicory* is kept up from fresh batches of pots being introduced at intervals of from two to four weeks, according to the demand for them. Eleven or twelve-inch pots are the sizes used, and into these the roots are potted quite thickly, allowing the crowns to protrude just above the soil. We have just lifted all the *Sea-Kale*, and selected the crowns that are fit for forcing, potting the roots at once, and plunging the pots in cocoanut fibre refuse out of doors, from whence they are removed to the forcing house as required. Besides the *Chicory* another wholesome salad that may be treated in the same way is the common *Dandelion* roots. A stronger-growing and improved form of it is cultivated in France, and where a variety of salad is in request is an excellent addition to the usual subjects grown for this purpose. The pots when in the forcing house should be plunged in some moist material; we find cocoanut fibre refuse just the thing for it. A bed such as decaying manure and leaves causes too much heat, and the roots are thereby injured.

Attention must also be given to continue a supply of Mushrooms, and to this end the very best spawn must be used. It would be quite out of place to recommend dealers; but it is quite certain that on the quality of the spawn depends much of future success. Growers must in this remember the old and wise saying, "Penny wise and pound foolish." A fresh bed must be made up every six weeks if a continuous supply has to be maintained. Occasionally a bed will continue to bear for two, and even three months; but it must not be depended upon to do this. We knew a gardener who was very particular when saving the horse droppings for his Mushroom beds to fork out all the rough litter from amongst them, and when the heap was under preparation in an open shed no pains were spared in order to have it in the best condition by frequent turning; and yet under the most favourable conditions his Mushroom beds were frequently of inferior quality, and mostly small, plenty of "buttons," but few for broiling. It is certainly best to use the dung in a more rough state, add to it a little turfy loam; and we have had good results from a portion of fresh cow manure being added to the heap, and thoroughly incorporated therewith. A thermometer for testing the bottom heat should always be kept for use in the newly-made beds. The hand is an uncertain test, and serious mischief is caused by spawning before the bed is ready—that is, before the heat has subsided to about 80°.

GREENHOUSE AND CONSERVATORY.

During the last three or four weeks *Chrysanthemums* have been holding regal sway, but they are now being rapidly thinned out. As the flowers fade the plants are cut over, and the pots removed to a cool airy house to produce a supply of cuttings for next season's bloom. The young shoots are very frequently attacked by aphid, but this must be destroyed at once either by fumigating or by dipping the plant in diluted tobacco water. The *Chrysanthemum*, though quite a hardy plant, is very easily injured by insect pests.

To take the place of *Chrysanthemums*, *Camellias*, *Cinerarias*, *Cyclamens*, *Tree Carnations*, and *Cape Heaths*, such as *Erica byemalis* and *E. melanthera*, are very useful at this time, and the flowers of all of them are used for bouquet-making and decorative purposes indoors. *Epiphyllums* in variety, when brought on in a little heat, are also a distinct and very beautiful feature; they are, moreover, most effective when worked on the *Pereskia* stock on stems from 6 to 18 inches high. With a selection of the above, supplemented with the usual bulbous roots that are imported from Holland, and, of course, all other plants which will come in from the forcing houses, such as *Spiræa japonica*, *Lily of the Valley*, *Deutzia*, &c., there need be no lack of an abundant floral display all through the winter and spring months.

Now, just a word or two as to the treatment the above selection of plants require, and first the *Camellia*. Keep the leaves free from dust by sponging, and avoid a parching atmosphere,

such as may be caused by the hot-water pipes being overheated on a frosty night. Should a frost set in the fires are started, and to be safe a much higher temperature is maintained than is necessary, and, should the frost continue, care must be taken not to have more heat in the pipes than will be sufficient to resist the entry of frost; more than this may cause the flower buds to drop. *Cinerarias* and *Primulas* are liable to damp. Remove all decaying leaves from the base of the plant as soon as they are perceived, and fumigate with tobacco smoke as soon as green fly is observed on the *Cinerarias*. In watering be careful not to wet the foliage. Large handsome specimens are obtained by tying-out the flower stems. *Cyclamens* are also very liable to be injured by damp. A drier atmosphere seems better adapted to them, and they throw-up the flowers better if the night temperature does not fall lower than 45°. *Tree Carnations* also flower more freely in the same house. In an ordinary greenhouse temperature where the frost is merely kept out the flowers do not open well, and some of the very best sorts will not open at all. The plants are also subject to the attacks of aphid, and if, as is sometimes the case, it is not convenient to fumigate, the insects can easily be removed with a small brush. The weather is often unfavourable for working out of doors this month: tying, training, and cleaning plants may be attended to, making sticks and labels, pegs for bedding plants, and all such work should be brought forward when occasion offers.—J. DOUGLAS.

TRADE CATALOGUES RECEIVED.

James Backhouse & Son, York.—*Catalogue of Hardy Trees and Shrubs, including Conifers.*

Thomas Sampson, Preston Road Nurseries, Yeovil.—*Catalogue of Gladioli.*

R. Parker, Exotic Nursery, Tooting, Surrey, S.W.—*List of Double-flowered Pyrethrums and Miscellaneous Plants.*

Dickson & Robinson, 23, Market Place, Manchester.—*Catalogue of Select Roses, Winter and Spring-blooming Plants, &c.*

PROVINCIAL HORTICULTURAL EXHIBITIONS.

[SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held. Although we cannot report them fully, we shall readily note anything especially excellent, and we wish for information on such specialties to be sent to us.]

Birmingham (Chrysant.)	1 and 2	1, 2, and 3

TO CORRESPONDENTS.

* * * All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

COLORLED PLANS (H. J. R.).—There would be no utility in them. An engraving in outline of a bed with figures referring to the plants to be placed there, their colours and heights, is much more useful.

POTATOES.—SUTTONS' HUNDREDFOLD FLUKE.—"I have grown it this year with other varieties—viz., Breese's Peerless, Rivers's Ashleaf, and Early Rose. With the exception of the Hundredfold they have all been badly diseased. It certainly has been touched, but to a very trifling extent. It has been with me an enormous cropper, and for cooking has proved itself quite the reverse of what your correspondents state."—RICHARD J. SORLEY, *Cheshire*.

[It appears that this variety differs in its merits in various districts. We cannot insert any more communications on the subject.]

LILIAM CANDIDUM LEAVES VARIEGATED (H. F.).—They are strongly streaked with yellow, and you say the variegation is permanent. We cannot say that this Lily, or any white-flowered plant, is improved by such variegation. The flowers are rendered more conspicuous by dark foliage.

IMPORTING FERNS (*Shin Hall*).—Any closely-covered box would do for protecting Ferns during a seven-days voyage. They are far more enduring than flowering plants.

GERANIUM SEEDLING TRIPLE SEED-LEAVED (A Constant Reader).—The occurrence is not common, but is probably more frequent than is supposed, few caring to notice such things. It will not make any difference to the growth afterwards.

WINTERING GERANIUMS IN A CELLAR (*Flitcher*).—The plants will winter safely in pots in a cellar from which frost is excluded, but they would not do so well in a warm one, though if the temperature does not exceed 50° they would not be excited into growth prematurely; if it exceeded 50° they would probably grow, and shoots made in the dark are not good. It is quite true that *Geraniums* may be wintered tied up by the heels in a cellar, but they do better with the roots placed in dry sand. All the leaves should be removed,

and the plants dried before being placed in the cellar. They should be removed from the cellar in March and potted in moist soil, not watering much at first, only keeping moist, increasing the supply of water with the growth.

FLOWERING PLANTS FOR A NORTH BORDER (A. B. P.).—*Ajuga orientalis*, *Allium triquetrum*, *Aconitum napellus* and var. *blandum*, *Arabis alba*, *Aubretia grandiflora*, *Convallaria majalis* (Lily of the Valley), and its varieties gold-striped, rosea, and plena; *C. multicolor*, *C. rosea*; *Cyclamen hederifolium* (neapolitanum), *C. Cotta*; *Digitalis spectabilis*, *Helleborus niger*, *Hemerocallis flava*, *Hepatica angulosa*, *H. trilobata* in variety, *Hypericum calycinum*, *Meconopsis cambrica*, *Mimulus cupreus*, *Myosotis dissitiflorus*, *M. raietensis*, *Omphalodes verna*, *Papaver nudicaule*, *Primula acaulis* vars., *Palmatoria angustifolia*, *P. officinalis*, *P. sibirica*, *Ranunculus acris*, *R. repens*, *R. nemorosus*, *Sisyrinchium grandiflorum*, *Spiraea Filipendula plena*, *S. japonica*, *S. palmata*, *Trollius europaeus*, *T. napellifolius*, *Vinca major* and *V. minor*, and Violets of kinds.

LILICUS REPOTTING (T. H.).—In potting these you will remove the stem and any roots adhering, which will leave you the bulb proper with its true roots, and these are not on any account to be removed, but preserved entire, merely taking away any loose soil between them, such as can be removed without injury to the roots, and shifting into a larger size of pot with the roots intact.

CHASSULA COCCINEA REPOTTING (Idem).—Your plant being very much pot-bound, we should at once shift it into a pot a size larger, or shifting may be deferred until February, affording good drainage, and watering carefully until the roots are working freely in the fresh soil. Equal parts of sandy loam, loam and peat, half a part old cow dung or leaf soil, and one-sixth each silver sand, pieces of charcoal, and broken pots answer well. For the end inside wall of the cool greenhouse you could not have anything better than Lapageria r sea, it and the white variety also forming a capital contrast.

CAMELLIA ELEGANS BROWNED (W. Jones).—We think that the composition of which you enclosed a sample would have the effect you mention. It contains carbolic acid.

SWEET NANCY (C. R.).—We do not know any plant named "Sweet Nancy," but *Saxifraga umbrosa*, which is called London Pride, or None-so-pretty, has its last name sometimes corrupted into Nancy Pretty.

APPLE SHOOT DRYING (A. L. C.).—They are severely infested by the scale. Paint the branches and twigs infested with a creamy mixture of soft soap and sulphur in water.

EARLEY'S NOVEMBER PLUM.—In your notice of the Fruit Committee Meeting, page 421, a Plum is mentioned under this name. You say it is a large Ballace, which is quite right. I believe it to be identical with the large Ballace that has been grown in the neighbourhood of Ilford for perhaps fifty years; and as the notice of it appears in your Journal, I would like to ask Mr. Earley through the same medium why it is called Earley's Plum.—J. DOUGLAS.

LATE DESSERT APPLES (G. Bingham).—The following six succeed as dwarfs:—Adam's Pearmain, Braddick's Nonpareil, Cockle Pippin, Golden Reinette, Margil, and Sturmer Pippin.

THE BURR KNOT APPLE.—"Mr. John Scott, of Merriott, Somerset, can supply it. If H. P. has not the following dessert Apples, I can strongly recommend them to him:—Cox's Orange Pippin, Ribston Pippin, Carraway Russet, Boston Russet, and the Blenheim Orange. The last is good for dessert, and excellent for sauce. It should be gathered before it is ripe, or it may be woolly.—W. F. HADCLIFFE."

CONCORD AMERICAN GRAPE.—A Guernsey correspondent asks what is the best way to cultivate it. He has it in pots in a cold vinery, and has seen it planted out, but the results are not satisfactory growth. In each case the vines were weak and the fruit did not ripen. His plants are two years old.

PEACHES AND NECTARINES ON EAST WALL (J. H. D. C.).—We do not know in what way we can be of service to you, not knowing what points of culture you require information about. If regarding fruiting we should remove them at once to a wall with a south aspect, lifting carefully, and preserving as much soil as possible about the roots. If furnished with bloom buds it is likely they will bear on the south wall next year, provided they are protected from frost. It is difficult to suggest a remedy for a deficiency of fruit on Peach trees under glass. Something is vitally wrong—either the trees are too far from the glass, or the light is obstructed by objects intervening between them and the glass. The cause may be the soil being poor and light, overtopping, &c. Give us some data, and we shall be glad to assist you.

STRAWBERRY-FORCING FOR MARKET (Z. N.).—For the London market the plants should be started early in January, so as to have the fruit ripe at the close of March or beginning of April. The earlier in the season it is produced the higher its price, but then the crop will be less; so that though the prices are higher the difference in the proceeds from early and moderately early crops is not very great. The beginning of January we consider quite early enough to commence forcing Strawberries for fruit in March, having a second batch to come in in April, and a third one early in May. Only fine fruit command high prices, and such should be aimed at rather than the production of a quantity of small fruit which does not pay, fetching low prices and not meeting with a ready sale. There is generally a sure market for any quantity of fine fruit, but successful supplies are best, arranging with a fruiterer to take them. The fruit is sold by salesmen or agents. We do not know anyone doing business entirely in Grapes or Strawberries, but you will meet with those willing to take any quantity of fruit by an advertisement, or by applying to some of the principal dealers in Covent Garden. Strawberries and Grapes may be grown to pay if well attended to. The fruit is packed in shallow baskets or punnets, each fruit separate in a leaf, or in shallow thin deal boxes, so as to hold one or at most two tiers of fruit; but from the dealer you arrange to supply you, you will have the requisite instructions. President is a kind of good size and travels well.

GREENHOUSE HEATER (Perth ed.).—You would require several such contrivances, and these would be too much moisture given off. Write to Mr. Shrewsbury, in Innonger, Lower Norwood, and ask him for information.

CUCUMBERS SPRINKLING AND VENTILATING (G. S.).—They will require only moderate syringing during the dull winter months. A light sprinkling in the morning, and another in the afternoon, will be sufficient; and in very dull weather the sprinkling of the paths and every available surface once or twice a day will give you all the atmospheric moisture required. The pipes, we presume, have evaporation troughs. As to giving air, we can only say, Give it in mild weather, a little every day whenever opportunity offers, not firing with a view of giving air in very cold weather but with sun, but a little in dull

weather occasionally is good, taking care at all times to avoid cold cutting currents. From plants sown in October you ought to cut fruit in February, and, if they do well, in January. For fruit early in spring the seed may be sown about the 15th of December, but we should not do so, as you have other plants, until the turn of the days.

VENTILATORS IN GREENHOUSE BACK WALL (H. P.).—The result of having open ventilators at the back of your greenhouse communicating with the potting shed will be, that in severe weather you will be in danger of having the plants frosted; or if not that, which will be dependant upon the heat you can command by the heating apparatus, the ventilators will waste the heat given off by the hot-water pipes. Have them fitted with a three-quarter-inch frame and a door hung on pivots or a swivel, and with a cord the doors may be closed or opened at pleasure.

LIQUID MANURE FOR CHRYSANTHEMUMS (Bob).—Your proportions are very far too large. One pound of guano and a peck of soot to thirty gallons of water are the proper quantities.

GAS HEATING (J. B.).—The apparatus will, like any other, be injurious to the plants unless the products of combustion be carried out of the house.

NAMES OF FRUITS (J. Green).—Beurré Diel. (C. P., St. Leonards).—Marie Louise, very small. (J. G. Pickering).—Apples: 204, 209, Blenheim Pippin; 193, Dumelow's Seedling; 177, Winter Greening; 210, Nonpareil; 150, Wyken Pippin. Pears: 111, Duchesse d'Angoulême; F. Uvedale's St. Germain; J. H. Knight's Monarch; L. Sussette de Bavy. (W. B. B.).—19, Dumelow's Seedling; 15, Nonpareil. The others not recognised. (William Earley).—13, Barcelona Pearmain; it ought to keep longer than November. We cannot recognise 11 and 12. The seedling is, as you say, "not quite up to the mark." (L. A.).—1, Knight's Monarch; 2, Sussette de Bavy. (M. N. O.).—Pears: 1, Beurré Diel; 2, Chamonville; 3, Easter Beurré. Apple: 1, Wormsley Pippin; 2 Not recognised. (C. H. S.).—Passo Colmar. (Cambridge House).—1, Easter Beurré; 2, Belle après Noël; 3, Bergamotte Espère; 4, Blenheim Pippin; 5, Scarlet Nonpareil; 6, Knight's Monarch.

NAMES OF PLANTS (J. C.).—The specimens are small, but appear to be—1, *Selaginella Martensii*; 2, *S. denticulata variegata*; 3, *S. Lyallii*; 4, *S. helvetica*; and 5, *S. uncinata* (caesia).

POULTRY, BEE, AND PIGEON CHRONICLE.

CRYSTAL PALACE POULTRY SHOW.

"Swifter far than summer's light,
Swifter far than youth's delight,
Swifter far than happy night,
Art thou come and gone."

THE 1400 pens of birds are gone! Some to new homes, some to their old ones. Mr. Billett has walked along his three miles of pens, and carried the ten tons weight back to Southampton; the Secretaries are putting their accounts in order; the exhibitors are making out the best routes to Birmingham for the journey before them to-morrow; and the Palace is left alone!

The classes we reported on last week were done so fully that we could not possibly criticise the Game, or the Hamburgs, or the Waterfowl, to do by them as we had done to the others, and consequently we were reluctantly compelled to wait to this week to speak of them.

The HAMBURG classes were very beautiful. There were 138 birds in all, and we hope some have found new southern homes, and will appear at some of the Kentish shows now coming on so thickly, for Hamburgs generally at these meetings are poor—very poor. At the Palace we thought the Golden-pencilled and the Black the best classes, though some of the Golden-spangled were very grand. The first cock was a great beauty, good in comb and ears. Second also good in all points. Third a fine bird, but a shade wrong in comb. 1471 (Hyde) a smart bird. In hens the cup bird was only in at £3 3s., she was a nice one, with a good deal of dash about her; but we liked the second quite as well. Third, too, was a smart hen. 1485 (Vouchley) good; 1484 (Pattison) splendid colour, but a shade discoloured in ears.

In *Silver-spangled* cocks the first was an exquisite bird; if he had a failing it was in comb, still we thought he won well. Second rather clondy in tail. The third was better, only his comb was rather rough. Still we think these pens could have changed places. 1506, very highly commended (Robinson), a capital bird. In *Silver-spangled* hens the winner was very good, her spangling very fine; still the second must have run her closely. Third, too, wonderfully good. 1515 (Mitchell) beautifully marked; as was 1525 (Ashton & Booth). In *Golden-pencilled* cocks Mr. Beldon won the cup with a dashing bird, which ran in first easily. The second was also a very good bird, of good colour and comb. Third very fair, but not up to first or second. 1527 (Speakman), very good in lobes; also 1534 (Walker), and 1537 (Robinson). In *Golden-pencilled* hens the first was a most exquisitely pencilled bird, but a little faded in colour. The second was well and distinctly pencilled on the body, but rather clondy in tail. Third was very rich in colour, but somehow we did not much fancy his markings. 1549 (Beldon) was a good bird, well shown; 1551 (Woodworth) well pencilled, and good in colour. *Silver-pencilled* winning cocks were good. The first had a capital tail, and was a stylish bird; second also had a beautifully-edged tail, and the best comb; third also good. 1557 (Norton) a capital bird, and almost crept into the list, we should say. In hens the first was again only in at £3 3s.; she was a nicely shaped bird, but a little too heavy in marking. Second we liked quite as well. Third a

nice clearly marked good-combed bird. 1566 (Ellis) a good pullet.

Black Hamburghs made two very beautiful classes. The first cock was gorgeous in colour, and in all points as perfect as any bird we ever saw. Second, too, a smart bird, with a great deal of style. Third was good in colour, but he carried himself badly. 1585 (Serjeantson) we preferred, or even 1588 (Beldon). The hens were very excellent, as a lot we thought them as perfect as we ever saw a class. We liked the second and third quite as well as the first, but they were three well-shown good birds, and it was a close thing between them. 1590 (Cutlack) good in shape and colour; 1595 (Gladstone) a smart bird, and so was 1606 (Marler).

SPANISH came to the front much better than we expected. We have seen these classes so badly filled of late that it was quite pleasant to see close on seventy birds, and all of very good quality. Mr. Beldon took the cup with a good bird—fine in face, and good in comb. We liked the third as well as the second; he will beat him in a week or two when he has his plumage better. 1209 (Rodbard), a bird of quality, but not well shown. The winning hens were very fine. The first was good, and will be better yet. Second good also, but wants time. Third in the best condition of the lot, but lacking the genuine quality of the first. Highly commended 1222 (Jackson), a good hen. Mr. Darby's pen was empty. The cockerels were an admirable class. Miss Browne won cup and second with two beautiful chickens. Third had a fine smooth face, and was in good plumage. 1227 (Jones) a nice cockerel, and will come to the front yet. 1249, very highly commended (Browne), a very fine bird with a large face. The pullets were fifteen in number. The first-prize bird was beautifully shown, and had a capital face and comb. The second was a lovely bird, well got up; her face was large, and her comb in good show order. Third had much quality, but looked untidy. 1266 (Browne) very good, also 1256 (Parker) had a good face, and will make a fine hen.

MALAYS came nineteen pens strong. We will do a little sum here *à la* Mr. Hinton. Nineteen seven-and-sixpences make £7 2s. 6d., and as we are told a cup was provided for this class by a few breeders, we may naturally imagine the Malays have paid well this time, and so having done we hope next year to see two classes for Malays, and one of them for the White variety, just as an experiment, for most certainly the White pen which won this year is a very grand one. We admired the second cock immensely; his colour is very rich, and he is a Malay all over. Mr. Hinton must give him a better lady companion next time, and they will do then, though we do not at all wish to despise the fair one on this occasion—far from it. We would like to see the second cock and the third hen together; they would make a grand pair. The third cockerel was in very good feather. They were three good pens, but we think we should have made a sandwich, and put the White between the Browns! 1906 (Rooth) very good indeed, so was 1891 (Elliot); in fact there were lots of good pens, and it evidently shows us that it is all humbug saying Malays are so few and far between. They are like Silkies and Leghorns, and are those kinds of breeds that only want classes to bring them out, and we do think it too bad of committees never to give these breeds classes unless they have the greater part of the prize money provided for them.

The fourteen classes of *GAME* brought close on 230 pens; we think there should have been more, considering the value of the prize money given. *Black Red* cocks came first. Mr. Mathews took both first and second with two very good birds of grand style and colour. The second failed in one eye—his only blemish. Third was of good colour, but in not all trim. 1615 (Field) wants more time, and he will make a grand cock. 1616 (Pope) was a smart stylish bird. 1609 and 1614 (Aykroyd and Forsyth), two good birds with a great deal of style. In *Black Red* cockerels Mr. Mathews again to the front with a grand chicken, and this took the cup, and took it easily. This gentleman also took third with a bird much resembling the cup bird, though not quite so good in shape. The second was a smart cockerel with a good tail. Fourth a large bird, with rather heavy feathering. 1625 and 1628 (Beck), both good birds. 1636 (Pope), very stylish. In *Black Red* hens or pullets the first was a good bird with fine shape and of admirable colour. The second and third prizes again went to Stowmarket birds, and two nice birds they were, with little to choose between them. Fourth was a true Game hen, with good shape and fine colour. 1666 (Pope) a good smart bird! *Brown Red* cocks were twenty strong. The cup bird was very grand, and was claimed at £20. Second was also capital in all points. Third also a fine bird. 1676 and 1680 (Warde), both two good old birds, which want a little time yet.

In *Brown Red* cockerels the first was large and good; second a very fair bird; third smart, and bright in colour; fourth a useful bird, but not so good in colour; highly commended 1691 (Cock) a stylish bird, which will do some winning yet. There were twenty *Brown Red* hens or pullets also, and they made a capital class. Mr. Wolff won the cup with a hen with an immense deal of style, but there was something in her

colour we did not care for. Second was a grand pullet, and won the cup at Oxford we believe, and we should think was near doing it here. Third went to Mr. Wolff again, and we liked the colour better than we did in his cup bird. Fourth was a good chicken all round. We liked 1739 (Osborn) also, and 1747 (Chesters) very much indeed. There were only seven old *Duck-wing* cocks. The cup bird was very good in colour and hard in feather; second splendid in hackle, and good colour also; third a very nice stylish old bird. 1749 (Mathews) was a bird which in a month we shall expect to see winning. In *Duckwing* cockerels we liked the second or third quite as well as the first-prize bird, though the hackle of the last named was very fine. 1758 (Bell) not very good in colour, but smart in shape and carriage. In the pullet or hen class a beautiful pullet won, but the second ran her closely, being in better condition. The third was very good in all but feet. There was another pullet or two in the class which we liked as well as this third-prize bird.

Piles had two classes, "males and females." In the first of these we liked the second as well as the winner, taking him all round he looked better. Third was a heavy bird, but good in colour. Highly commended 1796 (Foster), good in carriage and tail. In the next class we thought the winners well placed. The first is very good, so is the second. We believe this was the bird we especially noticed at Tunbridge Wells. Third was a good bird, of nice colour, and very fine in neck and head. The two classes for *Black* or *Brassy-winged* only had seven entries between them—hardly encouraging for another year, and here Mr. Montresor owned five of the seven pens. They were not very first-class. We liked the third pullet better than the second, which was not of the proper colour. In the £5 5s. sale class the first were very good, and fetched a good sum at the auction. The pullet should have been in the list in the open class, we think. Good *Brown Reds* won second. Except these two pens we did not think much of the class, though the pullet in 1818 (Ashley) was a smart bird.

Ducks.—*Aylesburys* did not muster heavily—only a dozen pens. The cup pair were large, and good in bills and shape. We liked the third-prize pen much more than the second. We were sorry to hear that Mr. Fowler's wonderful drake, which we have so often had cause to mention, got hurt on the road, and was consequently out of it. The fourth were a pretty pen in shape, but rather tinted in bills. The *Rouens* made up for the *Aylesburys*, being very excellent in quality and quantity. The first were a fine pen. We fancied we saw them at Oxford with the cup card on them. The second also good, and closely pressing on the first. Third not so large. We think there was a better pen among the highly-commended ones, of which we especially liked 2789 (Pope), and 2808 (Dowsett).

There were twenty-two pens of *Black Ducks*. This breed (as far as winning is concerned) seems to be in the hands of Messrs. Kelleway and Sainsbury. First the one gets a cup, and then the other. It will be Mr. Sainsbury's turn at Birmingham. The cup pen here were certainly the smallest, but we liked the colour of the second and third best. Some day we hope to find the Judges going in for colour before actual size. All the highly-commended pens were good. We must say the Committee did their best to put them in a good light, and they succeeded. They looked as well as they did at Oxford, and we shall not easily forget the beautiful light they were in there.

Ornamental Ducks created quite a sensation. They always go down with the ladies. The first prize went to scarce and very beautiful spotted bills. Second to exquisite Mandarin, the Oxford cup pen we believe. Third very beautiful Carolinas. In this class Bahamas, Carolinas, Cayugas, Mandarins, and Call Ducks, all of wonderful quality, had to rest satisfied with high commendations. Next year, Messrs. Secretaries, to make your Duck department perfect, you must have a class for *Call*.

GEES and *TURKEYS* were very fine. We believe they were not weighed. If this was so we think it was a mistake—one of the only mistakes in this marvellously well-organised, ably-conducted Show. In *Gees* the winning Embdens were very large; so were the second Toulouse; the third were also a magnificent pair of Embdens. The three *Turkey* classes had some very fine rich coloured birds. Mr. Kendrick's single birds looked very weighty. In young *Turkey* cocks every bird was noticed, as also were five out of the seven hens. 2911 (Kew, not Keir, as in the catalogue) was very monstrous for a hen, and we thought the winning bird a bargain at the catalogue price of £14s.

This brings us to the end of the Show—a Show which perhaps may never be surpassed. We have done our best to criticise it honestly and fairly. Of course in a show like this some good pens must be overlooked, but we have tried to do justice to all.

The sales were very numerous. The cup *Dark Brahma* pullet was sold for £20, as was also Mr. Martin's cup *Brown Red* Game cock for the same sum. Lady Gwydyr's *Buff Cochins* in the £5 5s. class went for £12 10s. Mr. Braund's *Gold-faced Bantams* fetched £14 14s., and Mr. Vander Meersch's *Frizzled Bantams* were claimed for £10 10s. Very many pens changed hands from £5 5s. to £10 a pen. Mr. Graham had four *Pigeons* (*Dragoons*)

claimed for a total of £75, and Mr. Tegetmeier's Blue Dragoon found a purchaser at £15 15s.

In conclusion we must express our great sorrow on finding Mr. Hewitt's well-known face so conspicuous by its absence. We are indeed sorry to hear he is poorly again, and trust it is only a passing illness, and that we shall find him at Birmingham, and find him well.

PIGEONS (by "WILTSHIRE RECTOR")
(Continued from page 466.)

Trumpeters.—First a wonderful Black; second Mottled; third Black.

Owls (English).—First-and-cup thorough English; second, save in colour, as good as first; third a Silver, a very noble bird, but bars not quite so good as second. This was a strong class, and very high commendations very numerous.

Owls (Foreign).—First-and-cup a charming White, not over-clean. All the winners were White, and I am happy to say the two classes of Owls seemed distinct—one large and fine, the other small and elegant.

Turbits (Blue and Silver).—Turbits are clearly great favourites. First-and-cup, a beautiful Silver; the extra second as beautiful a Blue, bars raven. The whole class was excellent.

Turbits (Any other colour).—I can equally praise this class. Red shouldered, yellow-shouldered, and black-shouldered birds stood before me in rare excellence.

Next followed a long lot of good Magpies of various colours.

Runts.—May I ask that these birds be provided with larger cages next year?—they literally were cramped, and could not well turn. I plead in the cause of kindness, and also the birds would look better. (Mr. Wilson, please read, and when having read make a note of.)

Flying Tumblers.—A comparatively new class, and I was delighted that the Crystal Palace admitted them, for no Pigeons have more enthusiastic admirers. First and second, pretty Yellow Mottles, which looked the real thing, but the third was too much a Short-face. 3916, a good blood-red bird.

Antwerps (Short-faced).—Many of these birds struck me as being too heavy in build and wattle. The first (Mr. Ludlow's), was quite my idea of a show Antwerp.

Next the Homing Antwerps.—Many of these racehorse Pigeons looked "ready, aye! ready." The prize pairs were beautifully matched, whether they were Red or Blue Chequers, and their colour, no doubt, guided very much the Judges; indeed, I never saw more beautiful Blue Chequers. And oh, Pouter fanciers! Chequer as well as Mealy is a beautiful colour, and deserving of culture and class.

The four pair pens.—These large pens were removed a distance from the other Pigeons, and formed a striking feature of the Show. There were sixteen of them, and they only had one fault—viz., that the cocks will fight. First-prize Trumpeters, Laced Fantails, Jacobins, and Turbits. Mr. Serjeantson showed, but not for competition, a beautiful group of Fantails. In pen 4112 was a pair of Mealy Frillbacks, an unusual colour. Perhaps more strangers paused over these pens than any others, and, indeed, they are very attractive in spite of the pugnacity of their occupants.

Any other variety, like the toast of "The Ladies," always comes last, and, like the ladies, excels in beauty; but I have seen a longer class and a prettier—because longer for it was pretty, and, like the lady in Shakespeare's *Midsummer Night's Dream*, when taunted with her shortness, replied—

"Not so short but I can reach your eyes;"

so they reached mine, not to injure them, as she meant to do, but to delight them.

Such were the Pigeons at the Palace—a goodly Show of good birds, the Selling class included; for in it were birds that at some shows would have been prize birds in prize classes. The gratification which such a Show must have afforded to young and old, gentle and simple, must have been very great. I heard hundreds express admiration. I saw young folks gazing and gazing. The schoolboy longing, no doubt, for Pigeons which his "Governor" will first object to, then grumblingly assent to, and then in his turn admire and pet.

BIRMINGHAM POULTRY SHOW.—The time is rapidly approaching for the holding of this great annual gathering in the midlands. The Hall has been thoroughly renovated, and many improvements for the comfort of visitors added. The 2177 poultry entries exhibit a large increase, and the show of Turkeys alone will exceed the total of many local shows; whilst Brahma Pootras, which a few years ago were in the Variety class, now far exceed any other sort in numbers and importance, having ten classes, forty-one prizes, six £5 ss. silver cups, and over five hundred pens. The stock and poultry arrive on Thursday and Friday next, and already the leading implement exhibitors and seedsmen are filling up their allotted spaces. The telegraph wires have been extended to the Hall; and a branch post office will be opened there previous to and during the Show. The

railway companies have announced numerous excursions from most districts, and altogether the prospects of the success of the Exhibition never looked brighter.

THE COMING BRISTOL POULTRY SHOW.

MR. CAMBRIDGE'S efforts have been crowned with success, and there is to be the annual Bristol Show. But this is not all: it is to be Bristol Show with improvements. Thus there are the following additions to the prize list: In poultry, prizes for White Dorkings, cocks any age, and for hens any age; Brown or Partridge Cochins, for cockerels of 1874, also for pullets of 1874; for White Cochins, cockerels of 1874, and pullets of 1874; for Game (Brown-breasted Reds), cocks any age, and hens any age; Houdans, cock any age, and hen any age; also there are prizes for Leghorns any variety, cock any age, hen any age. The increase in the prizes for Pigeons is also very considerable. Thus this year for Carriers, cocks bred in 1874, and hens the same; for Pouters, Black or Blue cock, and also for hen; Barbs, any colour cock over one year, and hens the same; and Barbs of 1874, cock or hen. For Jacobins, Red or Yellow, cock or hen, any age; Turbits, Red or Yellow, any age, cock or hen; prizes also for Magpies, Dragons bred in 1874, and Antwerps of this year, any variety. There are Selling classes both for poultry and Pigeons, six for the former, two for the latter. By the new rules a cock and one or more hens, or two or more hens by themselves, may be sent in the same hamper; and several pens of Pigeons may be sent in the same package, provided they are properly separated and labelled.

Thus, then, I trust the coming Bristol Show will be not only a pleasure, as it always was, but financially a success. No doubt many pens of poultry and Pigeons will be sold at so large a Show at the end of the season, when surplus stock is apt to be home to "hang in hand."—WILTSHIRE RECTOR.

THE POULTRY-KEEPER.—No. 28.

PADUAS OR POLANDS (Continued).

The feathers of the back (*fig. 136*) and those of the breast are spangled at the end and barred beyond the middle under the

Fig. 137.—Shoulder Feather.

Fig. 136.—Back Feather.

overlapping feathers. Those of the shoulders (*fig. 137*) are white in the middle, surrounded by a deep black border. This border decreases in the covert feathers of the tail (*fig. 138*), and become slightly bordered in the large feathers of the wing and tail (*fig. 139*). The feathers of the sides and abdomen turn to down, and are of a mingled greyish colour. A collar of small, short, turned-up feathers surround the cheeks and the under part of the beak.

The eye is very large, and the pupil of a brick red. The leg is blue in all the varieties. The varieties are all alike in form.

The cock of the Golden and Silver varieties essentially differs from the hen in plumage. The crest, the hackle, the lance-shaped feathers, and the shoulders are of a variable shining

white, on which can hardly be seen some small black spots. The black characteristic spots only appear on the covert of the wings, and the large feathers of the wings have a border like those of the hen. The collar is black and very clearly marked. All the breast and under the breast should be spangled as in the hen. The small sickles are of a bronzed black, and this continues to the fluff, and in some degree to the longer feathers, until they begin to get white to the large sickles, when they are quite white and only black at the ends.

Black Cochins, but the result of some cross which will become more coloured after every moult. I, some years ago, imported from Shanghai a cock and two hens which were perfectly black, though not of a good shape; from those I have bred a great many birds and never had a red feather. The cock and pullet at the recent Show are some of the progeny, and I have been assured by residents in China that there is a perfectly black fowl common enough in Shanghai.

Disappointed exhibitors are, I know, apt to grumble. I do not, however, wish to be considered as grumbling; I am only anxious to prevent, if possible, a spurious breed from becoming common, and the true breed being again after a few years lost or given up in despair. This need not be the case if the attempt to make the breed by a cross is relinquished and pure birds sought for. My advice is, let breeders destroy every bird with the slightest tinge of a red feather, and never buy without making the strictest inquiry as to pedigree.—C. M. HOLB, *Tiverton*.

POULTRY AND BIRDS.

I HAVE just thrashed and sold at 41s. 6d. per quarter a crop of Rivett wheat, grown after white wheat, and it yielded 7½ qr. per acre, tail included. This field is open to and within 30 feet of the fowl house, from which emerge every morning some 150 head of poultry, and they have been free to roam at large on this field from the time it was sown to the day of carting the crop. As it was drilled with something under 5 pecks per acre, and as the said poultry, immediately after sowing, took possession of the field and made a most searching and continuous examination of its contents, the prospect would appear alarming to those who were inexperienced in the matter; and I confess that, in the early days of my confidence and belief in poultry, I have felt somewhat nervous as to this and the next particular fields, knowing how sundry opponents of thin sowing would triumph and rejoice over a failure of the 4 pecks per acre. Well, but there is the fact of the 60 bushels of crop per acre, and by no means the first, second, or third instance of the kind, for, however shabby and scratched the plants may appear in their early growth, their ultimate development is grand, and the thickest part of the crop is always that nearest to the fowl house. They not only cultivate the crop but manure it, just as sheep do.

But the great benefit is, that not an insect has a chance of injuring a plant, while, at the lower end of the field, less used by the poultry, there was injury from wireworm. In fact, a long and close observation of the habits of birds and poultry has convinced me that they are the farmers' and gardeners' best friends. It has been jocularly said that nothing in the shape of live stock makes so large a return as poultry do, as "for every grain they give a peck." It is interesting to watch their operations. Having, with their active claws pulverised every clod and unhoused the plant-destroyer, he is at once appropriated and converted into food for our table. Winged insects also have a poor chance with them. How neatly they "knab" the fly from his place of settlement, whether on the legs of our horses or cattle, or on the walls or boards. A sensible cart mare in my stable would not lift

a foot so long as her favourite chicken was watching for and appropriating every fly that settled on any one of her legs. I have also been amused at seeing a blackbird on the lawn making a vigorous effort to withdraw from its hole a stout worm, and tumbling over backwards by an ultimate and suddenly successful result. We should, as farmers and gardeners, remember that for probably eleven months out of twelve birds have to live upon the insect tribe, and that it is only during the ripening or ripened period that we must, by netting and other means, protect our fruit and crops. The good they do vastly exceeds the injury; I therefore strictly forbid bird-netting, and strongly advocate that there should be at least 1 per cent. of shrubbery to every one hundred acres of farm as a home for birds.—J. MECHI.

[The above is contributed to the *Farmer* by Mr. Mechi, and it is worthy of the consideration of all cultivators of the soil. Mr. Mechi is no mere theorist; we remember his farm near Tiptree Heath, the most unproductive of farms, with a soil specially difficult to cultivate. We remember the Wilkins's,

Fig. 138.—Tail Feather.

Fig. 139.—Large Wing and Tail Feather.

The Golden variety is marked with black on a bright brownish yellow ground. The Silver is entirely white. The Black is entirely black. One of the prettiest varieties is of entirely Cuckoo plumage. Of the crest the front half is cuckooed, and the back half white.

For the cuckooed cocks to be perfect they should be as well marked as the hens. The "Chamois" is of one colour, brownish yellow or speckled. The spot is clearer than the foundation of the plumage. These "Chamois" have the peculiarity that the hens are very good sitters.

BLACK COCHIN-CHINAS.

I HAVE just been reading your comments on this breed at the Crystal Palace Show and the award of prizes, from which it appears to me that judges still seem to consider that Black Cochins are the result of a cross, or they would not award a prize to birds with red feathers whilst there are in the class any without them. I maintain that those with red feathers are not

Rixs, Cheveleys, &c., but no one succeeded so well as Mr. Mechi.—Eds.]

MR. LINGWOOD'S DORKING COCKEREL AT THE OXFORD SHOW.

THE Dorking cockerel exhibited by Mr. Lingwood was disqualified by the Judges on the ground that he was an adult bird. That there was ground for such an opinion is shown by our reporters sanctioning it. That they were all mistaken we have the assurance of Mr. Lingwood himself, and he adds that he can produce six respectable witnesses who had seen the Dorkings in their early stages. Mr. Lingwood states that the birds were hatched on the 23rd of February, and we can readily understand how birds hatched thus early, and having thriven, would appear adults when eight months old.

TRIMMED HAMBURGS AT THE OXFORD SHOW.

Mr. Long's letter written to Mr. Hewitt, published in last week's Journal, I strongly contradict. Never was a more profound falsehood written respecting the trimming of his bird. I think it would have been far more prudent on the part of Mr. Long to ascertain the truth of the matter before writing such a letter to anyone; and I hope he will withdraw his statement. I have sufficient proof of the bird, if it is required, being placed in the hamper with the white on him when he was sent to Middleton Show, by parties who know the bird equally as well as myself.—THOMAS MAY.

BARRHEAD POULTRY SHOW.

This was held on the 21st inst., when the following awards were made:—

OLD SCOTCH BREED.—1 and *hc*, Mrs. Lukeman, Hamilton. 2, J. Jardine Hamilton. 3, W. Berry, Hamilton.
SPANISH.—1, J. More, Avon Braes, Hamilton. 2, T. Ewing, Alexandria. 3, J. Crawford, jun., Beith. *hc*, A. H. Gray, Waterloo, Wishaw. *c*, J. Murray, Carnforth.
DOEKINGS (Except White).—1, Special, and *c*, J. Hall, Barrhead. 2, Z. H. Heys, Barrhead. 3 and *hc*, A. J. Mather, Kilmarnock.
GAME (Black-breasted and other Reds).—1, R. Heys, Barrhead. 2, J. Williamson, Johnstone. 3, J. Nelson, Cockshaw, Hexham. *hc*, L. Casson, Ulverstone. *c*, J. Waddell, Airdrie.
GAME (Any other colour).—1 and Special, R. Heys. 2, H. Paterson, Kilsyth. 3, J. Nelson. *hc*, J. Allison, Shotts. *c*, J. Gray.
HAMBURGS (Golden-spangled).—1 and *c*, J. Crawford, Beith. 2, J. Kirkland, Stewarton. 3, A. Robertson, Kilmarnock. *hc*, J. Hamilton, Dalry.
HAMBURGS (Silver-spangled).—1, J. Smith, Stewarton. 2, Mrs. J. Cochran, Strathaven. 3, T. Black, Stewarton.
HAMBURGS (Silver-spangled).—1, H. Stenworth, Barnley. 2, A. Stirling, Barrhead. 3, R. Bruce, Bn-by. *c*, J. Stewart.
HAMBURGS (Silver-spangled).—1 and Special, P. Lynn, Coltness, Newnams. 2, H. M. Millan, Glasgow. 3, H. Kinniburgh, Glasgow. *hc*, J. Lochard, Kilmarnock.
BRAHMA POOTRA.—1, Mrs. Alston, Craighead, Hamilton. 2, 3, and *c*, D. Honeyman, Larbert.
COCHINS (Any variety).—1 and Special, J. Drinnan, Woodhall. 2 and 3, T. Bruce. *c*, W. Cochran.
POLANDS (Topped).—1 and 2, J. & A. Laird, Johnstone. 3, A. Cowan, Killermont.
FRENCH.—1 and *c*, A. Jack, Barrhead. 2, T. Fullarton, Troon. 3, J. C. Shaw, *hc*, J. Forrest, Kilsyth.
ANY OTHER VARIETY.—2, T. M. Lellan, Barrhead. 3, T. Brisbane, Barrhead.
CROSSBREDS.—1, 2, and 3, J. Pollock, Mearns. *hc*, P. Kitch. East Kilbride.
GAME BANTAMS.—1 and Special, W. Stewart. 3, J. Campbell. 3, J. Gow and Walker, Kilmarnock. *hc*, D. M. G. G. Pollock, Mearns. T. Corbett, Barrhead.
BANTAMS (Any other variety).—1 and 2, D. Kerr, Beith. 3, A. Robertson, Kilmarnock. *hc*, W. Miller, Falkirk; G. Hamilton, Neilston; J. Marshall, Airdrie.
ANY BREED.—Hens.—1, W. Lindsay, Bushy. 2, R. Heys. 3, J. Stewart. *hc*, R. Thomson. *c*, J. Forrest; A. Robertson.
Ducks (Any variety).—1, Special and 2, A. Robertson.
DUCKS (Any other variety).—1 and 2, J. Pollock, Mearns. 3, H. M. Millan, Blantyre. *hc*, J. Pollock; P. Kitch.
TURKEYS.—1, Z. H. Heys. 2, Mrs. Alston. 3, J. M. Lellan. *hc* and *c*, W. Robertson.
SELLING CLASS.—1, F. McKinlay, Glenmill, Campsie. 2, J. Borlan, Fouldhills, Kilmarnock. 3, C. Martin.

JUDGES.—Mr. James Logan, Eastshield, by Carnwath; Mr. Alexander Paterson, Airdrie; Mr. John McInnes, Broomlands, Paisley.

BURTON-ON-TRENT POULTRY AND BIRD SHOW.

THE sixth annual Exhibition of poultry, Canaries, and other cage birds was held in St. George's Hall, Burton-on-Trent, on Friday and Saturday, November 20th and 21st. There was a very good show of poultry, many fine pens of birds representing the various classes. The cage birds were exhibited in two divisions—viz., "birds hatched in 1874" and "birds of all ages," and in each division there were many fine specimens shown. The latter classes contained several very high-coloured peppered birds, exhibited by Mr. T. C. Salt, Burton. The Exhibition was held under most distinguished patronage, and was ably carried out under the auspices of a good Committee of management. The number of entries in the poultry classes reached 161, and in the Canary classes 163, forming altogether a suffi-

ciently attractive display. St. George's Hall is a well-adapted place, far better than the Town Hall, where several of the previous Burton Shows have taken place. The Canaries occupied the centre of the spacious Hall, the long stages for the birds being flanked on each side and along the bottom by double rows of pens (Turner's) for the poultry. The Committee were somewhat disappointed and grieved to hear of the indisposition of Mr. Hewitt, who was appointed one of the poultry Judges, but they obtained the kind and valuable services of W. J. Drewry, Esq., Burton, who officiated in his place. We believe the Show was well patronised. Mr. T. Newbold, Secretary, discharged his duties in a satisfactory manner. The following is a list of the awards:—

DOEKINGS.—1, W. H. Crewe, Derby. 2, E. Shaw, Oswestry. *c*, Miss Murray, Thelthorpe.
COCHINS.—*Cinnamon* or *Buff*.—1, W. H. Crewe. 2, W. J. Nash, Walsall. *hc*, E. G. Keay, Birmingham. *Any other variety*.—1, W. Clark, Nottingham. 2, E. Pryor, Welwyn. *hc*, W. Whitely, Clough; Rev. R. Fielden, Langley.
BRAHMS.—*Light*.—1, J. Hunter, Burton. 2, F. Holbrook, Derby. *hc*, H. Chawner, Uttuxeter. *c*, A. O. Worthington, Willington. *Dark*.—1, W. J. Nash. 2, Mrs. Allsopp, Worcester. *hc*, Bridgewater & Yoxall, Wednesbury. *hc*, F. Holbrook, Bridgewater & Yoxall.
FARNS.—1, W. Farrall, Burton. 2, H. Feast, Swansea. *hc*, G. W. Hibbert, Godley, Hyde. *c*, H. Chawner, jun.
GAME.—*Black Red*.—1 and Extra, J. Glassbrook, Burton. 2, Duke of Sutherland, Trentham Hall. *hc*, W. T. Everard, Ashby; C. Spencer, Thulston. *hc*, T. Gorton, Burton; E. Clavey, Burton; E. S. Gossell, Stroud. *Brown Red*.—1, W. T. Everard. 2, E. Winwood, Worcester. *hc*, Duke of Sutherland. *hc*, J. Bates, Burton; J. & E. Prince, Nantwich. *Any other variety*.—1 and Extra, E. Winwood. 2 and *hc*, E. Bell, Burton. *hc*, Duke of Sutherland. *c*, T. Bates, Burton.
HAMBURGS.—*Gold* or *Silver pencilled*.—1, A. F. Faulkner, Thrapstone. 2, Duke of Sutherland. *hc*, S. W. Hallam, Whitwick; Dr. Hall, Swadincote. *Gold* or *Silver-spangled*.—1, T. Bates. 2, S. W. Hallam. *hc*, S. Howarth, Burton.
BANTAMS.—*Game*.—1, T. Bates. 2, A. Ashley, Worcester. *hc*, S. W. Hallam. *hc*, Winfield & Andrews, Worcester. *Any other variety not Game*.—1, F. Holbrook. 2, J. Watts, Birmingham. *hc*, J. H. Law, Highgate; J. Mayo, Gloucester.
ANY OTHER VARIETY.—1, Mrs. Allsopp, Rugeley (Spanish). 2, G. Burrell, Rugeley (Malay). Extra 2, Duke of Sutherland (Black Hamburgs). *hc*, J. Pitts, Wolverhampton (Spanish).
SELLING CLASS.—1, W. H. Crewe (Black Hamburg). 2, J. M. Cooper, Burton (Dark Brahms). *hc*, E. Shaw (White Dorking); W. J. Nash; Duke of Sutherland.
CAGE BIRDS HATCHED IN 1874.
BELGIANS.—*Marked Buff*.—1, G. Bennett, Burton.
NORWICH.—*Clear Yellow*.—1, R. Cowley, Burton. 2, W. Jackson, Burton. 3, T. Bates. *hc*, C. Pratt, Burton. *hc*, A. Curtis, Burton. *Clear Buff*.—1, J. Dent, Burton. 2, R. Cowley. 3, W. Jackson. *hc*, T. Newbold, Burton.
NORWICH.—*Marked Yellow*.—1, R. Cowley. 2, J. Dent. 3, W. Jackson. *hc*, T. Bates. *hc*, T. Newbold. *c*, W. Holmes, Burton. *Marked Buff*.—1, T. Newbold. 2, W. Jackson. 3, C. Pratt. *hc*, R. Cowley. *hc*, J. Dent. *c*, A. Curtis.
NORWICH.—*Variegated Yellow*.—1, T. Newbold. 2, W. Jackson. 3, R. Cowley. *hc*, Fearn, Tisbury. *Variegated Buff*.—1, J. Dent. 2, W. Jackson. 3, R. Cowley.
NORWICH.—*Heavily variegated Yellow*.—1, T. Newbold. 2, A. Curtis. 3, W. Jackson. *c*, J. Dent. *Heavily variegated Buff*.—1, F. Bates. 2, J. Dent. 3, T. Newbold. *hc*, J. Fearn; W. Jackson.
NORWICH.—*Green Yellow*.—1, R. Cowley. 2, T. Bates. 3, W. Jackson. *Green Buff*.—1, W. Holmes. 2, W. Jackson. *Disqualified*, J. Dent.
NORWICH.—*Crested Yellow*.—1, W. Watson. 2, A. Curtis. 3, W. Holmes. *hc*, T. Newbold. *Crested Buff*.—1, C. Pratt. 2, W. Holmes. 3, W. Watson. *hc*, T. Newbold. *hc*, W. Jackson. *c*, G. Bennett.
CINNAMON.—*Yellow*.—1, J. Fearn. *Buff*.—1, T. Newbold. 2, J. Fearn.
LIZARDS.—*Golden spangled*.—1, J. Fearn. 2, W. Jackson. *Silver-spangled*.—1, W. Jackson. 2, J. Lacey, Burton.
GOLDFINCH MULES.—*Jouque*.—1, A. Curtis. *Nealy*.—1, A. Curtis. 2, T. Newbold. 3, J. Fearn. *hc*, W. Jackson.
ANY OTHER VARIETY OF MULE.—1, A. Curtis.
CAGE BIRDS OF ALL AGES.
BELGIANS.—*Marked Buff*.—1, G. Bennett.
NORWICH.—*Clear Yellow*.—1, 2, 3, and *hc*, C. J. Salt, Stapenhill. *hc*, W. Jackson; W. Gretton, Burton. *c*, G. Bennett. *Clear Buff*.—1, 2, 3, and *hc*, C. J. Salt. *hc*, J. Dent.
NORWICH.—*Marked Yellow*.—1, C. J. Salt. 2, J. Dent. 3, A. Curtis. *Marked Buff*.—1, 2, 3, and *hc*, C. J. Salt.
NORWICH.—*Variegated Yellow* or *Buff*.—1 and *hc*, C. J. Salt. 2, T. Bates. 3, W. Jackson. *hc*, W. Gretton. *Green Yellow* or *Buff*.—1, W. Jackson. 2, W. Gretton.
NORWICH.—*Crested Yellow*.—1, T. Bates. 2, J. Watson. 3, A. Curtis. *Crested Buff*.—1, C. Pratt. 2, F. Bates. 3, G. Bennett. *c*, A. Curtis.
CINNAMON.—*Jouque* or *Buff*.—1, 2, 3, and *hc*, C. J. Salt.
PAIR BREEDING BIRDS, MATCHED FOR BREEDING.—1, W. Jackson. 2, W. Gretton. 3, R. Cowley.
GOLDFINCH MULES.—1, A. Curtis. 2, J. Watson. 3, J. Fearn.
GOLDFINCHES.—1, A. Curtis. 2, R. Cowley. 3, W. Gretton.
BRITISH BIRDS.—*Open competition*.—1, T. Newbold (Thrush). 2, T. Peck, Burton (Bullfinch). 3, Mrs. Fogg, Burton (Thrush). *hc*, W. Jackson (Bullfinch); J. Winfield, Burton (Starling); J. Dent (Thrush); J. Cotton, Burton (Blackburn). *hc*, J. Cox (Dove).
JUDGES.—*Poultry*: Mr. E. Lowe, Comberford, and Mr. W. J. Drewry, Burton-upon-Trent. *Birds*: Mr. G. J. Barnesby, Derby.

THE SOUTH OF ENGLAND AND ISLE OF WIGHT ASSOCIATION have a show of Poultry, Pigeons, Rabbits, and Cage Birds at Portsmouth on the 8th, 9th, and 10th of December. The prizes are liberal; but to put all the varieties of Poles into one class and all the French varieties into another are great mistakes. No judge can give awards satisfactorily to such mixtures.

PROPOSED POULTRY AND CAT SHOW FOR TUNBRIDGE WELLS.—A number of gentlemen have decided upon forming this Show. At a meeting of the promoters, under the presidency of the Hon. F. G. Molyneux, the Right Hon. the Earl of Abergavenny, Viscount Nevill, the Marchioness of Camden, Sir David L. Salomons, Bart.; Col. Hassard, C.B.; Montague D. Scott, Esq., M.P.; G. B. Gregory, Esq., M.P.; Lord George Pratt, &c., consented

to become patrons. An influential working and general Committee was formed, and Mr. Apsley Smith, who has done so much to popularise the poultry department of the Kent and Sussex Agricultural Show, held in October at Tunbridge Wells, was appointed Hon. Secretary and Treasurer. The Show, which will be for poultry, Pigeons, Rabbits, Cats, and Cage Birds, will be held on January 21st, 22nd, and 23rd, and prizes and cups to the value of £200 will be offered for competition.

KILMARNOCK ORNITHOLOGICAL SHOW.

(From a Correspondent.)

The twenty-third Exhibition was held in the Corn Exchange on the 13th and 14th inst.

The *Spanish* were a remarkably good class. The first and second were chickens, first-rate in quality, and had every appearance of having been bred in the same yard. *Brahmas*, Any colour.—In this class many of the hens and pullets were good. A few good old cocks were also exhibited, but none of these had finished their moult. In cockerels there were few good ones. Vulture hocks were very common in this class. In *Cochins* Mr. G. H. Procter's grand well-known birds took the first and extra prize. The remainder of the class were not good. Silver-Grey *Dorkings* were a beautiful class. The Coloured *Dorkings* were also nearly every pen good. *Game*, Black or Brown Reds, were a large class. The prize birds were all good, but many hens in this class were only of medium quality. *Game*, Any other variety, were a good class. The first and second-prize were Duckwings, and very beautiful. The next class was for undubbed *Game*; these were a motley group, and, with the exception of the first, were very indifferent birds. The *Hamburgh* classes were well filled, there being many fanciers of them in the neighbourhood. The Golden-spangled were very good. The Golden-pencilled had thirty-four entries, and contained many good cockerels; but many of the pullets were deficient in fineness of pencilling. The Silver-spangled class was also a large one, and contained many very excellent birds. The Silver-pencilled class was far the weakest class of *Hamburghs*. *Poland* and *Orice-Cours* were exhibited together; the *Polands* received the most favours. *Scotch Greys* were a grand class. The cock in the first pen we believe was in the first pen last year; he is a grand fellow. There was a class for *Malays*, but they only mustered three entries; all were good. Any other distinct variety was a grand class; *Houdans* first, *Andalusians* second, and *Sultans* third; the fourth a grand pair of *Silbies*.

Of *Game Bantams*, Black and other Reds, there were fifty-three entries; many of the birds excellent. The cockerel in the second pen was a gem, but suffering from recent dubbing. *Game Bantams*, Any other than Reds, were also a grand class. The first were a beautifully-coloured pair of Duckwings. There were several other first-rate pens in the class. Of the undubbed *Game Bantams* the winning birds were good. Black and White *Bantams* were a good class, first and second being Blacks; third a nice pair of Whites. The Sebright *Bantams* were divided into two classes—Gold or Creamy Silver, and Silver Sebrights, clear white ground. Both classes were remarkably good, and had quite a host of admirers. In *Ducks* the *Rouens* were a grand class. The Any variety class was also good.

PIGEONS were a very large show. All the eight classes of *Pouters* were wonderfully good. *Carrier* cocks were also splendid. Young *Carriers* were a beautiful class. *Fantails* had thirty-two entries, many of the birds extremely beautiful in style and action. *Jacobins* were a large class of fifty-four entries, and many of the birds were very good. There was also a nice exhibition of singing birds and Rabbits.

(From another Correspondent.)

The success of this undertaking far exceeded the most sanguine expectations of the Committee. Notwithstanding the large space at their command, the Committee, we understand, were forced to refuse upwards of fifty entries in poultry and Pigeons. We give but a cursory glance at the poultry department.

The first class in the Show was *Spanish*, which was very well represented by twenty-six entries. The birds were in fine order; another fortnight would almost have perfected their plumage. We were glad to see such a fine array of those elegant birds, which stood out in bold contrast with their semi-shapeless neighbours, the *Brahmas* and *Cochins*. Of the latter class there were several pens of very large birds in fine plumage. The *Dorking* classes were small. The *Game* were well represented, particularly the Black-breasted and Reds. The special feature in this department was the *Hamburghs*. Golden and Silver-spangled, Golden and Silver-pencilled, and Blacks stood a hundred pens strong. In each of those classes were many beautiful birds, marked to perfection, and they gave the Judge no small trouble. The *Bantam* class, as usual at this Show, was a show of itself; 188 pens contained the various classes—viz., Black-breasted Reds, Variety, Black, White, Golden and Silver Sebrights. Amongst the *Game* birds were some most

elegant specimens, very gamey-like and graceful in their motions.

The *Aylesbury* and *Rouen Duck* classes were very well represented, and contained some remarkably large and fine specimens. In the Variety class of Ducks were several pens of very beautiful *Mandarins*, *Carolinas*, &c. The arrangements in this department were certainly most complete—roomy pens, ample passages, and good light.

PIGEONS.

This department was most successful, and has year by year been advancing to the magnitude of our city shows. The Exchange Hall was, as usual, filled, and for the first time two tiers had to be resorted to for the smaller birds, as well as the use of the gallery.

The *Pouters* amounted to 125 entries, and a finer collection of those birds has not been seen for years. Black and Blue cocks stood first in order. The first-prize was a Black, very handsome in form, displaying a well-formed limb; second a good Blue, rather heavy; third also a Blue, somewhat out of order; fourth also a good Blue, and of considerable merit. Red, Yellow, or Mealy Cocks.—First and special a beautiful Red of the old-fashioned style and colour, long in feather and limb; second also a good Red, but rather heavy in style, though well marked; third also a Red of fair markings; fourth a Yellow, evidently a young bird of fine style and limb. Mr. Mitchell's Yellow highly commended was evidently past his showing days. Any other colour Cocks.—First, second, third, and fourth were Whites, all very fine birds, the first nearly perfection in shape. Black or Blue Hens.—First and special a Blue, a very fine bird in every respect; second also Blue, a good bird; third a Black, well marked, but rather heavy; fourth Blue, a fine, handsome bird, but much too gay in the wing. Red, Yellow, or Mealy Hens.—First, second, third, and fourth Reds. First was a bird of unusual colour, and very handsome in style. In this class the Meals were completely put out, having to give way to the standard colours. One bird in this class, a Mealy shown by Mr. Mitchell, was perfection in form, and nearly so in markings. Surely there ought to be a class for Meals! Hens, Any other colour.—First, second, and third all Whites, handsome birds; fourth a Chequer, a fine bird, evidently young. Cocks bred 1874.—This class contained many birds which will, no doubt, be heard of again. Hens, Any colour, bred 1874.—This was a large and fine class of birds; many of them being young were not in show, but will be certain to command their places in another year.

Carriers.—Cocks any colour were a large and very fine class, the awards seemed to us to be well given. First and special was certainly a magnificent bird of Dun colour, and the best Carrier in the Show; second also a Dun, a fine bird; third a Black, had been a fine bird but was sadly out of order. Hens, Any colour.—First a very fine Dun; second a handsome Black, rather fine in bill; third a Black; fourth also Black, a good bird. Young birds bred in 1874.—This was a large class, and all the winners were birds belonging to local exhibitors. The English exhibitors certainly did not forward their best specimens, or they would not have been so completely beaten, but we understand that one or two English specimens did not arrive in time; if they had, the scale might have been turned. The Kilmarnock fanciers have for long been in the Carrier fancy.

Short-faced *Tumblers*, Any colour.—This was a very good but not large class. The Judge here seemed to have gone more upon colour than the shortness of face, and given the prizes accordingly. The second-prize, a Kite, we think ought to have stood first, being really the most perfect Short-faced bird in the class. *Barbs*.—This was a large and good class. First a very fine Black, fine head and wattle, and looked as if this were his first appearance for the season; second a very good Dun; third and fourth Black, very good, but we think there were others in the class which ought to have taken their places. Young *Barbs* in pairs, Any colour.—A small but good class. First Reds in very bad order, one of them showing the white feather; second we think should have stood first; the others poor. In this class were entries too late, which might have turned the tables. *Trumpeters* were a large class, containing mostly imported birds or birds bred from such. There was a great show of the rose and crown, but we think the Judge did not give due weight to the feet; many of them being very lightly feathered. *Fantails*, Any colour.—A splendid class of birds mostly of the Scotch Fancy, small and full of motion. All the honours were taken by Scotch breeders. The remaining classes will be noticed next week.

SPANISH.—Extra 1, W. McIntyre, Ochiltree. 2, R. Reag, Dalry. 3, J. Poulton, Bristol. 4, H. Beldon, Gt. Stock, Bingley. *hc*, R. Wilkinson, Early, Skipton. 5, J. More, Hamilton. 6, W. Nelson, Johnstone. 7, W. Wallace, Auchincraig. 8, R. Reag, A. Walker. 9, A. Robertson, Kilmarnock. 10, J. Armour.

IRISHIA POUTERS.—Extra 1, R. Maxwell, Dumfries. 2, W. Marshall, Bishopriggs. 3, W. Hughes, Glasgow. 4, A. Robertson, *etc*, H. Smith, Irvine. 5, W. Hughes. 6, N. S. Temple, Hexham. 7, G. Glatby, Meigle. 8, W. Harcourt, Buncup. *hc*, H. Wilkinson. 9, T. Pye, Lancaster. 10, T. Rames, Stirling. A. C. Russell, Cardross.

COCHIN-CHINAS.—Extra 1, G. H. Procter, Durham. 2, T. Fullarton, Troon. 3, and 4, T. Bruce, Bushy. *hc*, R. Maxwell. 5, J. Wyse, Falkirk. 6, Mrs. W. Steven. 7, W. M. J. Paton, Broughty Ferry. 8, Mrs. C. E. Taylor, Montrose. 9, J. Burns, Dundee.

DORKINGS.—*Silver-Grey*.—1, A. J. Mutter. 2, Capt. Lyon, Kirkcubright. 3, W. Murray, Dalmellagh. 4, J. Fotheringham, Stirling. *hc*, Z. H. Heys; T.

Smillie, jun. c, Z. H. Heys. *Coloured*.—Extra 1, G. S. Robb, Leslie. 2, A. Gibb, Ayr. 3, A. J. Mutter. 4, J. Turnbull, Larbert. *hc*, A. J. Mutter. 2, A. Gelladly. c, J. Bunce, Linnithgow. 3, Ferguson. *White*.—1 and 4, J. Pettigrew, Dalmellington. W. Brown. 3, W. Arnot, Dalmellington.

GAME.—*Black-breasted or other Reds*.—Extra 1, C. Jamieson, Forfar. 2, H. W. Hutchison, Kirkcaldy. 3, J. A. Mather, Dumfries. 4, J. Nelson, Hexham. *hc*, J. Chester, Nantwich; J. Nelson; W. Ormerod, Todmorden; J. A. Mather; c Jamieson; H. W. Hutchison; J. & C. Sheddin, Glasgow. c, G. C. Wilson, Milnthorpe West; R. Stewart, Blair Adam; E. S. Godsell, Stroud; H. Beldon. *Any other variety*.—1, Z. H. Heys. 2, J. A. Mather. 3, Howarth & Lever, Woodford, Eury. 4, H. L. Horne, Airdrie. *hc*, W. Nelson. c, J. Paton, Galston. Mrs. E. Freer, Kirkcaldy. *Undubbed variety*.—1, H. L. Horne. 2, J. A. Mather. 3, G. C. Wilson. 4, H. W. Hutchison. *hc*, W. Ormerod.

HAMBUCKS.—*Golden-spangled*.—1, 2, and Extra 2, G. J. Duckworth, Church. 3, H. Beldon. 4, J. Kirkland. *hc*, A. Ryeg. c, A. Robertson; W. Meanley, Birmingham. 3, Crawford. *Golden-pencilled*.—Extra 1 for hen and 4, G. J. Duckworth. Extra 2 for cock, W. Driver, Kenleigh. 3, H. Beldon. *hc*, J. G. Walker, Sunderland. 2, W. Dixon, Derby. 3, G. Caithness, Carnoustie; D. Gilmour; W. Linton, Selkirk; T. Black, Stewarton. *hc*, W. Speakman, Nantwich.

HAMBUCKS.—*Silver-spangled*.—Extra 1, H. Beldon. 2, H. Stansworth, Burnley. 3, G. J. Duckworth. 4, H. Stansworth. *hc*, J. Long, Bromley Common; W. Husband; J. M'Andrew, Carnoustie. c, R. Bruce. *Silver-pencilled*.—1, H. Beldon. 2, and Extra for cock, H. Smith. 3, J. Long. 4, J. Borland, Kilberchan.

HAMBUCKS.—*Black*.—1, H. Beldon. 2, H. Robinson, Baildon. 3, J. Long. 4, W. Wilson. *hc*, Stott & Booth, Hildesheim Brook, Eury.

HOLLANDS OR CREVE-CEURS.—Extra 1, H. Beldon. 2, A. M'Lelland, Barrhead. 3, J. Taylor, Montrose. 4, Mrs. J. Laird, Johnstone. *hc*, G. W. Hibbert, Godley, Hyde; A. Jack.

SCOTCH GREYS.—1, T. Wallace, Loans. 2, D. Kerr, jun., Park, Beith. 3, A. Gibb. 4, J. Fulton, Beith. *hc*, T. M'Murtrie, Tawthorn Toll; J. M'Quillan, c, R. M'Lelland, Ayr.

MALAYS.—1, R. Hawkins, Senham. 2, J. S. Rooth. 3, Rev. H. A. Fairlie, Kirkcubrecht. *Chickens*.—1, R. Hawkins. 2 and 3, Rev. H. A. Fairlie.

ANY OTHER VARIETY.—Extra 1, J. Lambie, New Cumnock (Hondans). 2, Rev. H. A. Fairlie. *Archangels*.—1, G. Anderson, Accrington (White Sultans). 4, Master A. Frew, Sluichartow, Kirkcaldy. c, H. Wilkinson (Hondans).

GAME BANTAMS.—*Black-breasted or other Reds*.—Extra 1, G. Bell, North Seaton, Morpeth. 2, R. Youll, Sunderland. 3, R. Bishop, Carnforth. 4, A. Crawford, Beith. *hc*, J. Mayo, Gloucester. *hc*, Z. H. Heys; W. Henderson; J. Nelson; A. Gibb; J. Scouler; A. Kennedy, Kilbirnie; J. Hine. c, G. K. Scobie, Dunfermline; W. Grice; J. M'Gawn.

GAME BANTAMS.—*Any other variety*.—1, J. Nelson. 2, R. J. Hartley. 3, J. Seton. 4, T. Barker. *hc*, D. Hunter, Sunderland. *hc*, J. Hunter; J. Nelson; R. White, Cockshaw, Hexham; J. R. Gilgoun, Crossgates, Fife; W. Rogers, Sunderland; G. Riley, Accrington.

GAME BANTAMS.—*Undubbed, any variety*.—1, T. Ferguson, jun. 2, T. C. Newbit, Epworth. 3, T. Barker, Burnley. 4, W. F. Addie, Preston.

BANTAMS.—*Black or White*.—Extra 1, W. H. Shackleton, Bradford. 2, C. E. and J. G. Illingworth, Hightown, Normanton. 3, J. Marshall. 4, D. M'Lauren. *hc*, H. Beldon. *hc*, Milner & Reamlan; R. H. Ashton, Mottram (2); Mrs. W. Shaw; T. Cropper. c, Miss J. M. Frew.

BANTAMS.—*Golden or Creamy Silver Shright*.—1, A. Millar, jun. 2, J. Millar. 3, W. Richardson, York. 4, J. Taylor. *hc*, W. Richardson; T. B. Carver, Langthorpe, Broughbridge; M. Leno, Markyate Street. c, J. W. Lloyd (2).

BANTAMS.—*Silver Shright, Clear White Ground only*.—1 and Extra, A. Robertson. 2, J. W. Lloyd, Kingston. 3, J. Paton. 4, Miss M. S. Millar. *hc*, J. Mayo.

SELLING CLASS.—*Any variety of Bantams*.—1, T. Barker (Game Bantams). 2, D. M'Lauren (Black Bantams). 3, W. Innie, Torrance, Kilwinning (Scotch Greys). 4, R. H. Ashton (Black Bantams).

SELLING CLASS.—*Any variety except Bantams*.—1, A. J. Mutter (Dorkings). 2, W. Greenshields (Spanish). 3, W. Jardine, Millburn, Tarbolton (Golden-spangled Hamburgs). 4, G. Willison, Kilmarnock (Brahmas).

DUCKS.—*Aylesbury*.—Extra 1 and 2, A. Robertson. 3 and 4, Z. H. Heys. c, W. Wallace. *Rouen*.—1 and 3, J. Nelson. 2, J. A. Mather. 4, Capt. Lyon. *hc*, J. Pollock, West Linton, Nettleton. *hc*, A. Robertson; R. G. Mulhgan; R. White. *Any other variety*.—1, H. B. Smith, Broughton, Preston. 2, Mrs. W. Shaw. 3 and 4, H. B. Smith. *hc*, R. H. Ashton; J. Johnstone, Sunderland (2).

GESE.—1, W. G. Mulligan. 2, H. M'Lelland. 3, J. Bunce.

TURKEYS.—1, Rev. H. A. Fairlie. 2, Misses Stirling, Craigie. 3, G. H. Guthrie.

PIGEONS.

POUTERS.—*Black or Blue*.—Cock. —1, J. Mitchell, Glasgow. 2 and 3, J. M'ulloch, Uddingston. 4, D. Lawrie. *hc*, R. Crow, Larkhall. c, A. N. Bryce, Edinburgh. *Hen*. —1, J. M'ulloch. 2, R. W. Bryce, Edinburgh. 3, W. Ridley. 4, J. Mitchell. *hc*, E. Beckwith. c, H. Thomson.

POUTERS.—*Red, Yellow, or Monty*.—Cock. —1 and 2, J. M'ulloch. 3, E. Beckwith, Monkwell, London. *Hen*. —1, J. M'ulloch. 2, J. Mitchell. c, A. Wintour, Edinburgh. *Hen*. —1, J. M'ulloch. 2, W. Ridley. 3, J. S. & A. Robb, Gabserton, Alloa. *hc*, J. Mitchell. c, J. M'ulloch.

POUTERS.—*Any other colour*.—Cock. —1, W. Ridley. Hexham. 2, J. M'ulloch. 3, J. Forest, Hamilton. 4, E. Beckwith. *hc*, A. Dunleavy, Glasgow. c, J. Paton. *Hen*. —1, W. Ridley. 2, J. M'ulloch. 3, A. Anderson, Trinity, Edinburgh. 4, J. Mitchell. *hc*, J. Day, Edinburgh. c, H. Davies, Kilbirnie.

POUTERS.—*Any colour*.—Young Cock. —1, 2, and 4, J. M'ulloch. 3, R. Crow. *hc*, J. Day. c, W. Ridley. *Young Hen*. —1 and 2, J. Mitchell. 3, R. Crow. 4, J. M'ulloch. *hc*, W. Ridley. c, D. Lawrie.

CARRIERS.—Cock. —Extra 1, W. Ridley. 2, S. D. Baddeley, Hereford. 3, H. Yardley, Birmingham. 4, E. Beckwith. *hc*, A. Hutchison; J. M'Cræ; E. Beckwith; J. & W. Towerson, Egremont. *Hen*. —1, S. D. Baddeley. 2, W. Ridley. 3, G. Brown. 4, H. Bankhead. *hc*, H. Yardley.

CARRIERS.—*Young Cock or Hen*.—1, J. Ross, East Gatehead. 2, H. Bankhead. 3, D. Robertson. 4, D. Munn. *hc*, G. Brown. *hc*, J. Ford, Monkwell Street, London; H. Bankhead; E. Beckwith.

TUMBLERS.—*Short-faced*.—Cock or Hen. —1 and Extra, E. Beckwith. 2, D. Brash. 3, H. Yardley. 4, J. Ford. *hc*, Miss M. S. Millar; R. Crow; E. Beckwith (2).

BARDS.—Cock or Hen. —1, E. Beckwith. 2, J. E. Spence. 3, A. N. Bryce. 4, J. Lamont, jun., Edinburgh. *hc*, H. Yardley; W. Brydone, Langton Malns, Danse. 3, Crow. *Young Pair*.—1, J. Glen, High Bessyhill, Cambuslang. 2, D. Lawrie. 3, J. R. Kennard, Helensburgh. 4, J. Smart, Montrose.

TRUMPETERS.—Cock or Hen. —1, A. A. Vander Meerzsch, Tooting, London. 2, J. Lederer, Booter. 3, J. & W. Towerson. 4, G. Ure, Broughty Ferry. *hc*, J. & W. Towerson; A. A. Vander Meerzsch.

FANTAILS.—Cock or Hen. —1, Master K. Blair, Johnstone. 2, Cumming and Fleming, Beith. 3, A. Smith, York. 4, W. & A. Crawford, Beith. *hc*, J. F. Loversidge, Newark; W. & A. Crawford; J. Main, Johnstone; Miss I. Blair, Thorn, Johnstone.

JACOBS.—Cock or Hen. —Extra 1, W. Brydone. 2, J. A. Gilmour. 3 and 4, A. A. Vander Meerzsch. *hc*, A. N. Bryce (2); J. Pyper, Belfast (2); J. Ferguson; J. A. Gilmour.

TURBITS.—1, W. Brydone. 2, A. Angus, Galston. 3, M. S. Temple. 4, J. G. Orr, Beith. *hc*, R. Brown; J. G. Orr; J. Muir; M. S. Temple.

OWLS.—*English*.—Extra 1 and 2, W. Ridley. 3, T. Foster. 4, A. Yuill, Glasgow. c, A. N. Bryce; W. & R. Davidson, Montrose.

TEMELEAS.—*Self-coloured, not Short-faced*.—Special 1, W. C. Cassels, Hamilton. 2, J. Glen. 3, K. W. Bryce. 4, W. Ridley. *hc*, B. Douglas; W. Millar; W. I. Martlebeck, Birmingham. *hc*, J. Glen; Cumming & Fleming; W. M'Kinlay, Kilmarnock; R. Cameron.

TEMELEAS.—*Blue-barred or any other colour, not Short-faced*.—1, J. G. Orr. 2, H. Fulton, Beith. 3, J. G. Orr. 4, J. Glen. *hc*, J. Kerr; J. Ford.

BEARDS OR BALDS.—*Long or Short-faced*.—1, W. Brydone. 2, W. Ridley. 3, W. M'Kinlay. 4, J. Kerr. *hc*, H. Yardley; J. Glen; H. Smith; J. G. Orr; E. Beckwith.

COMMON.—1 and 2, J. F. Cunningham, Beith. 3, A. Gray. 4, W. Mackie, Tarbolton.

NUNS.—1, J. Lamont, jun. 2, J. Clark. 3, J. Cargill. 4, A. Duthie.

ANY OTHER DISTINCT VARIETY.—Special 1, W. Brydone (Foreign Owls). 2, H. Yardley. 3, E. Lee, Nantwich (Dragoons). 4, T. Foster (Swallows). *hc*, A. N. Bryce (Dragoons); A. Duthie (Black Magpies); A. Anderson (Archangels); A. Jackson, Chequerbent, Bolton (2); J. & W. Towerson (2); H. Beldon. c, William D. Glass. 3, J. Lambie, New Cumnock. 2, D. Lawrie. 3, W. & A. Crawford. 4, J. & W. Towerson. *hc*, A. N. Bryce; c, K. Kilgour; J. Galt, Kilburnie.

CANARIES AND CAGE BIRDS.

CLEAN YELLOW.—Cock. —1, W. Campbell. 2, G. Grant, Bridgeton, Glasgow. 3, R. Crawford. 4, T. Vallance, Glasgow. *Hen*.—Extra 1, R. Byron, Dalry. 2, R. Crawford. 3, D. Dick. 4, D. Reid.

CLEAN BUFF.—Cock. —Extra 1, W. Paterson, Perceiton. 2, R. Baxter. 3, W. Adams. 4, D. Kilbirnie. *Hen*.—1, D. Holden, Irvine. 2, T. Vallance. 3, R. Paterson. 4, J. Graham.

PIREAL YELLOW.—Cock. —1, M. Adam, Ayr. 2, R. Millar. 3, T. Jamieson. 4, H. Adair, Crookedholm. *Hen*.—1, T. Vallance. 2, J. M'Lelland. 3, A. Kelly, Paisley. 4, R. Byron.

PIREAL BUFF.—Cock. —Extra 1, J. Kerr. 2, T. Vallance. 3, R. Brydon. 4, W. Thom, Stewarton. *Hen*.—Extra 1 and 4, A. Kelly. 2, A. Borland. 3, R. Paterson.

MULE.—*Goldfinch Yellow*.—1 and 2, J. Calderwood, Stewarton. 3, D. Young, Kilmarnock. *Goldfinch Buff*.—1, J. Calderwood. 2, A. Anderson.

GOLDFINCH.—1, T. Conn, Kilwinning. 2, A. M'Dowall, Dalrymple, Girvan. 3, T. Revie.

SELLING CLASS.—Cock. —Extra 1, D. Holden. 2, A. Borland. 3, R. Calderwood. *Hen*.—Extra 1 and 3, D. Dick. 2, R. Buntine.

HOME OR FOREIGN BIRDS, NOT INCLUDED ABOVE.—1 and *hc*, Mrs. W. Shaw (Cockatoo and Parrot). 2, Mrs. J. M. Wilson, Kilmarnock (Australian White Cockatoo). 3, T. Barrowman (Parakeet).

RABBITS.

ANY FANCY VARIETY.—*Buck or Doe*.—1, E. J. Fell (Spanish Lop-ear). 2 and 4, W. M'Quillan, jun., Galston (Lop ears). 3, J. M. H. (Hutchinson Himalayan). **COMMON**.—*Buck or Doe*.—1, J. Kirkland. 2, D. Smith. 3, J. Rankin. 4, J. Lochhead.

JUDGES.—*Poultry*: Mr. Richard Teebay, Fulwood, Preston. *Pigeons*: Mr. James Huie, Glasgow; Mr. T. J. Charlton, Bradford. *Canary Birds, &c.*: Mr. Samuel Brown, 100, West Street, Calton, Glasgow; Mr. Robert Crawford, Bankhouse, Kilbirnie; Mr. Robert Calderwood, Kilmarnock; Mr. John Mair, Kilmarnock.

PIGEONS AT NEWCASTLE-UPON-TYNE SHOW.

This was a success, not only as regards the large number of entries in almost every class, but the very satisfactory way in which nearly one hundred prizes, and about double that number of commendations, were awarded. It was an agreeable disappointment to me to find, that instead of my usual criticisms on the judging, it is merely requisite to give a general description of the winning birds.

Blue or Black Pouter cocks stood first on the list. The first prize and cup were awarded to a well-known Blue bird, although he stood between two very grand Blacks. The second, also a Blue, was perhaps a little more slender, similar in markings, yet wanting in crop; but were it in the hands of some, or oftener exhibited, it would show to greater advantage. In hens a large Blue was first; but I had a great liking for the second-prize hen, also a Blue, having grand style and markings, yet not so clear in colour. The commendations in both classes were well bestowed.

Red or Yellow cocks came next. A good Yellow was first, with plenty of limb and length of feather, but poorly marked. The second, a Red, was very fair in all points, a good blower, and always showing to great advantage. The hens were average birds; first a Red, measuring well, but faulty in plumage, Yellow taking second, and I rather preferred this to the former bird, being tighter in feather, and exhibiting herself well. A very-highly-commended bird was close upon them with quality in every respect. In the classes for Any other colour, in cocks I found a dashing White first, showing every point asked for. The second prize, although given to a true "Any other colour," might have been better bestowed upon either of the two highly commended birds. In hens of this questionable colour the prizes were well awarded to good Whites, and no fault could be found with the commendations. A word of advice to the disappointed: I would mention that many good Pouters exhibited, and not realising the expectations of their owners, would perhaps have done better if they had been trained more to the show pen, and asked to appear in their best attitude.

Carriers.—Black cocks consisted of half a dozen very good specimens. In spite of a deformed wing, the Judges thought a bird good enough for the first prize. My opinion was with the majority—that the bird ought to have been disqualified, especially when a first-rate bird in the next class was passed over for a little blindness of one eye. The second prize was awarded to a really good bird, only beaten by a little more size of eye; but surely a damaged bird ought not to be placed before a first-class bird in every respect. The first-prize Black hen, although a little ragged, possessed excellent head, beak, and wattle properties, and when in full feather is a fine specimen of an English Carrier. In Any other colour, cocks, Duns took both prizes. Although the first-and-cup bird was much admired for its perfections, I would not have complained had the awards been reversed; in addition to being equal in points, the second-prize

bird was by far the better in colour. In hens the first pen was a little the better in eye, yet the second was superior in colour. One or two good birds were highly commended.

Passing on from birds of the past and present, we get a glimpse of the future, and behold youthful promise very fairly developed—a strapping fellow full of vigour and very even in head points, showing a great contrast between himself and others; this and the second-prize birds were Duns.

Dragons, Blue or Silver, were a very large class, so large that the Committee could have afforded to have given an extra prize or two; if even only a third of 5s., there would still have been left £5 on the class. The first was a Blue, well made, with beautiful black bars, and a proper blue rump; second a Silver of a very fine soft colour, and well proportioned. A few commendations were given, yet many very good birds were unnoticed. Yellow or Red.—The former beat the latter, both being first-rate birds; but so good was the class that almost every bird was deserving of a prize. In the class for Any other colour a Grizzle beat a White. These excepted, the class was nothing extra.

Almond *Tumblers* came next under notice, and a very fair collection they were—ten birds, with nearly every property first-class. The first-and-cup bird and the very highly commended one were well broken, the former beating the latter and the second pen in beak and head points. Almond hens were a small class, and only contained three really good birds, properly placed. Second very charming in colour. Tumblers, Any other colour, comprised very good head-and-beak birds. First a little gem of a Kite; the second a Black Mottle, standing between two much superior birds, a Yellow Mottle being one, which was not mentioned. The hens were a very fair class, yet the Judge again appeared to have forgotten that the class was more for the head-and-beak birds than for the best Kite or Mottle. Those low-headed and old-fashioned birds are of no use against good head-and-beak birds. In Tumblers of this year a nice little Red was first, and Yellow Mottle second.

Barbs, cocks, any colour, a very grand Dun had an easy victory, and a Black second; only two more worthy of note. In hens it was similar; a Black first and a Yellow second, the others only middling.

In Foreign *Owls*, Blue or Silver, Blues of course took both prizes. White or any other colour proved a larger and better class; White first and Black second.

Trumpeters, Mottled, first-and-cup Dark, yet wanting in colour and feet feather. The second and highly-commended birds left little to choose between, the former having the larger rose, and the latter the better feet feathers. Four very good Blacks were in the "other variety" class, the first pen being excellent in feet.

Fantails, White, an excellent class, the same bird winning that has been, I believe, either first or second for four or five years. Many others with large and well-spread tails took the other honours, yet some were coarse and wanting carriage. Any other colour, a small Blue was first, and a large coarse Silver with ragged tail second, possessing nothing but colour to recommend it.

Jacobins, Red or Yellow.—The class was large, but many very indifferent birds were shown; about a dozen, however, were pretty fair, consisting of three or four good Yellows, and amongst the remainder was a neat little Red hen, taking the first prize and cup. She appeared to strike the eye of all by her closeness of chain and compact appearance. The second-prize bird had a good hood and chain with a nice short beak, yet lacking freshness of plumage. In Blacks some half-dozen decent birds contested. First a little hen, good in all points; second a very rich-coloured and good-chained bird, rather coarse, but well cut. One or two good birds were highly commended. The class for Any other colour contained, in addition to Whites, three Blues and one Silver, Whites taking the prizes; first large, second a little marked.

Turbits, Red or Yellow, a good class. First a Yellow, well furnished; second Red, small and better colour. Any other colour a very fair class. First Silver, being very fine and soft in colour, and well deserving its position, although a Black late arrival, had it been in time, would have very much questioned the Silver's honours. Second a Blue—small, clean, and neat. Others, well-frilled and clean-cut, were highly commended. Red or Yellow, rare specimens of this class took the first and second prizes; both birds were Yellow. Any other variety, a poor class; first and Black second.

English *Owls* were a very large class, and many grand birds, Silvers proving superior to Blues.

The other classes—*Maggies*, *Nuns*, *Antwerps*, common *Tumblers*, and the Variety class, did not call for any special comment.

Although I have entered at some length into many classes, I must not omit to mention that this liberal-minded Committee, for such it is when it is remembered that they who are all Pigeon fanciers, actually give classes for poultry, Canaries, and British birds, and that, notwithstanding the discouragement of last year, they are now in such a financial position as many a society would envy. It was indeed pleasing to me to notice the many

greetings of good old fanciers who perhaps had not seen each other for at least a twelvemonth; and the fact that at one time on the opening day I could count at least a score of good Pouter fanciers speaks a deal for that breed, and that it must be well heard of in this locality in the future.—IMPARTIAL.

HIGH-FLYING TUMBLERS.

AMONG the numerous fancies peculiar to Pigeon-keeping in America there is a very interesting and amusing one that has been sadly neglected; it is that of flying Tumbler Pigeons. By that I mean training them to fly high and stay up for hours. Several years ago quite a number of breeders in this city kept a flight of such birds, but I believe the fancy has entirely departed, until to-day there is not a good flock of high-flyers to be found. I am told by an old fancier from across the seas that in the city of Vienna, Austria, some years ago twenty thousand birds were kept for this especial purpose, and in the early morning hours of a clear day the sky would be filled with these encircling flights of Pigeons. On the housetops would be seen the different owners watching the evolutions of their respective flocks, marking here and there a defective bird, as one not entitled to good company, but only fit for boys or the spit, and again praising the performance of some extraordinary member of the flock. The variety known as Balda is the favourite of fanciers of this sport, and it does not matter as to colour if the bird is short or pleasant-faced, clean cut, and of good staying qualities.

In the matter of tumbling authorities differ, some favouring birds that tumble as they rise and fall, others claiming that they must not tumble or they will bring down the flight. In raising a flight of Tumblers one wants to be particular if it is the bald-headed variety, and mate only well-marked and good-coloured birds, as this is one of their attractions; if their flying qualities are known, good flyers should also be mated together, for if one is an indifferent flyer and the other a good one, the weaker of the two will have a tendency to injure the flying qualities of the other by inducing it to settle or fly low. This raising of a good flight of high-flyers is not the work of a day or month, but it is only attained after many months of patient watching and experimenting.

The room in which they are kept should be furnished with an area or trap for letting the flight loose, and also furnished with loopholes and bolt-wires, so arranged that although they will allow a Pigeon to enter, it cannot get out unassisted. The loft should be made as attractive for them as possible, by furnishing it with plenty of clean water, feed, gravel, and rock salt, or salt cat, so that when they are let out they may give all their attention to flying, and not be searching around for something to gratify their appetites; a dish for bathing should also be provided, that their plumage may be in fine clean condition; in fact, every want should be supplied, and their home be made as attractive as a Pigeon-loft can be. It is a peculiarity of these birds to fly to a great height, and it is necessary for the fancier to be present when they are let out, that he may know each individual bird, and mark those for breeding and laying that rise to the greatest height. Thus, by careful selection from his young stock, he can establish a flight of a dozen or so birds that will cheer his heart and do him great credit.

But we will suppose the fancier has worked patiently for years, and has finally established a respectable flock. We go with him some bright May morning to the home of his feathered favourites; they have learned his step so well that, as soon as we reach the entrance, and before the door is opened, we can hear their delighted fluttering; they well know that the hand that turns the key in the lock never comes except it brings them some dainty to feast on. This time their treat is canary seed, and as their master scatters it around they eagerly seize it, and never leave off the search until every grain is devoured. But we have come to give them a fly. At this time of the day they know what the visit means, and as soon as the trap is opened they are ready and off. As I have said, it is a morning in May, the air soft and balmy, the skies bright and clear, unchecked even by a passing cloud. The birds feel the influence of the invigorating air, and rise in circles higher and higher, their bright clean plumage glistening in the sunlight, their peculiar markings showing to the greatest advantage. Now one throws a somersault, but it is so neatly done that he never leaves the flight; again, another shows his agility, and so they keep soaring and tumbling, and yet all so close together that your pocket-handkerchief could cover them; but your neck begins to ache from so constantly gazing upward, and you turn to earth awhile to relieve the strain upon it.

In commenting on the qualities of the favourite birds an hour slips away, and when you again turn your eyes heavenward nothing but empty space meets your gaze. Where are they? What has become of them? Have they settled on some neighbouring roof? No! you look again, and away up as far as you can see, a number of glistening specks greet your eyes, and as you continue to look the forms of the birds descending come

distinctly into view; down they gradually come, circling and tumbling as before, until, with one last tumble and pitch, they settle all about you, showing a little appearance of fatigue as the high-mettled racehorse after a two-mile heat. They rush for the loopholes, are soon inside, and attacking the food provided for them with appetites such as only such exercises can give. Here, in their loft, they remain confined until the usual hour for morning exercise comes round again, when, if the weather is bright and clear, they are indulged with another fly.

In flying birds care should be taken not to allow a hen out that is just about laying, nor if a pair has eggs, to allow both to fly together, as they may fly so long as to allow the eggs to get cold. Or, again, if it is the morning when you let them fly, and the pair go out together, the cock will be likely to leave the flight after flying a short time, and come back to the nest; his doing so will be very apt to cause the whole flight to settle. I should greatly like to have this amusement become general, and to all lovers of this fancy can truly say, nothing in this way can give you more pleasure than in training and watching a flock of high-flying Tumblers.—BLUE JACOBIN.—(*American Fanciers' Journal*.)

MESSENGER PIGEONS.

One lesson taught by the war between France and Germany was the value of well-trained Carrier Pigeons in all besieged cities, and both countries are now taking steps to procure a good supply. The Germans have established Pigeon stations at Hamburg, Metz, Berlin, Cologne, and the fortresses of Magdeburg, Wesel, and Minden, and the Government has stimulated the creation of Pigeon-flying clubs, one of which, ironically called "The Concordia," has recently flown a number of birds from Paris to Cologne, so that they might know their way in case of an emergency. Several of those Pigeons flew the distance in seven hours, thus attaining a very high rate of speed, but it must be added that the Germans have purchased the best Carriers procurable in Belgium. At a sale in Brussels the other day sixty Pigeons realised four thousand francs, or two and a half guineas each, the whole of them being bought for Germany. In France, upon the other hand, M. Geoffroy St. Hilaire, the Director of the Jardin d'Acclimatation, has induced the Minister of War to sanction the establishment of a "military dovecote," which is to contain some 450 Pigeons, provided by two of the most successful breeders in Belgium. A sum of money has been placed at M. St. Hilaire's disposal, and with the progeny of these birds he will soon be in a position to people the dovecotes which are to be placed in all the chief fortresses of France. The Pigeons will also be trained to fly distances of three or four hundred miles, and each Pigeon will be made to travel in different directions; for as a postal messenger in time of war he must be able to fly to any point of the compass. Experience shows, however, that the Carrier can easily be trained to do this, for M. Perre de Roo, the great Belgian breeder, relates an instance in which he brought eight Pigeons from Antwerp, and let them loose at Greenwich. After wavering in their flight for a few minutes they went off in the direction of London, and M. de Roo never expected to see them again; but he received a telegram from Antwerp a few hours later to say that they had all returned to their dovecote, and these were Pigeons that had never crossed the sea before.—(*Daily News*.)

YORK AND DARLINGTON CANARY SHOWS.

At the York show-room I found a much better collection of birds than I expected. To the credit of Mr. E. Todd and a willing, painstaking, practical Committee, every arrangement had been made for the comfort of the 230 specimens entrusted to their care, and likewise of the visitors who were admitted to the show-room at about midday, or soon after the judging had been concluded. The Show was held in the Corn Exchange, and extended over two days, the 10th and 11th inst.

The classes commenced with *Belgians*. Any variety, but there was nothing of a very sensational character. Mr. T. M. Reid's Yellow was a tolerable good bird, showing best for points. Messrs. Orme & Ashley exhibited a very fine Clear Yellow *Norwich*, which gained a first, having good bloom throughout. Still, I have seen a better-coloured bird this season. Messrs. W. & C. Burniston were well in for a second prize. The two very highly commended birds of Mr. Adams, and the one (20), exhibited by Mr. Pope, were all fine. There were a mixed lot of *Clear Buffs*, which were not altogether to my satisfaction, and not nearly so good as those which were shown at Darlington a day or two afterwards. The *Evenly-marked* and *Ticked* classes contained some capital birds. There were twenty-nine Crested birds in both classes, but the Buffs had the best of it. A few good *Lizards*, both Gold and Silver-spangled, were on the stages. No. 112 (Gold-spangled), exhibited by Messrs. Burt & Blemstone, would have looked much better had it not been clipped in the back part of the cap feathers. In the *Cinnamon* classes Mr. Adams exhibited some high-coloured birds, and gained three

prizes out of four. Mr. Smith won a second in Buffs. *Yorkshire* birds were present in strong force. Mr. Stewart gained a first in Yellows with a fine bird; Mr. Myers being in close attendance for the second place. The latter exhibitor also deservedly won first honours in Buffs. Uneven-marked *Yorkshire*—Mr. Belk first, Mr. Hawman second, both good.

In the *Auy* other variety class Mr. Garbutt exhibited an immense Buff Copy-crested bird. First prize was accorded to it, and second to a Scotch Fancy. It is somewhat amusing to find those who are in the dark with respect to this particular kind of bird terming them Belgians. In the Selling class Messrs. Orme & Ashley were at home for a first prize. Class 19 (sixes), nine entries, T. Cleminson first, J. Calvert second. Mules were pretty good, both Marked and Dark. There were eighteen Goldfinches, but Mr. Cox won first, Mr. West being second. The first-prize Bullfinch belonged to Mr. Lister, and the second to Messrs. W. & C. Burniston, who also took a first prize with a capital Brown Linnet, sixteen others standing behind. Mr. Carrick was second with a tolerably good bird.

What would old "Isaac of York," the Jew familiar to all readers of "Ivanhoe," have thought, had he in his day witnessed such living golden specimens of Canaries as were shown in the Corn Exchange, York?

But I must be thinking of Darlington, where I found myself wrapped-up in the "Fleece," a very appropriate and acceptable term, for the weather had changed to thorough winter. After a dreamy night about high-colour and high-shouldered birds, I awoke to find the ground covered with snow—certainly not very deep, but it brought to my mind something in the nursery-rhyme style I had learned about "the fleece as white as snow," rhyming with some such words "sure to go." Well, I was quite ready to go, for unless I visited the Mechanics' Hall, Darlington, to see what sort of birds there were, I should know very little concerning them. The total number of entries reached 426—a goodly array certainly, made-up of the best specimens that could be sent. Such a display of Belgians has not been seen for many a day, Mr. Rutter being present with a dozen (not ten), all on this occasion being conveyed to the Show by himself. Whether anyone else had an "interest in one," is not for me now to say. There is no telling what future events may bring forth.

In taking a survey of the birds generally, I found some of the best specimens I had every witnessed, especially the *Norwich* birds. In Classes 1 and 2 Mr. Rutter took four prizes with wonderfully good birds, being first and third in Yellows, and first and second in Buffs. Mr. Rutter's other birds gained high commendations; but it would extend the report too much to enumerate other than the highest prizetakers. Mr. R. Hasman took a good second, getting-in cleverly betwixt Mr. Rutter's pair. Sergeant-Major Paxton won a good third in Buffs. In the next six classes for Clear Yellow, Clear Buff, Evenly-marked Yellow, Evenly-marked Buff, Ticked Yellow, and Ticked Buff, Mr. Adams, of Coventry, won twelve prizes out of eighteen. His birds were a sight alone worth witnessing. Messrs. Mackley took three thirds, Messrs. Brown & Gayton a first, Mr. G. Cox a second, and Messrs. Moore & Wynn a third. This is something like disposing of the *Norwich* classes. The prize list will afford all particulars. In the Crested classes there were a number of fine birds shown, but as is usually the case, the Buff-crests were the most showy. Messrs. Mackley's first Buff was a bird much to be admired.

In the four classes of *Lizards* there were several first-class birds exhibited, but still they are not so good generally as I have seen on many previous occasions. A great mistake was committed through some of them having been moulted upon the pepper diet. Instead of improving them it spoils the appearance of the feathers. There were very few birds in the two first classes that could be called at all perfect, being open-backed, bad-spangled, or otherwise deficient. Messrs. Cleminson and Ellerton won the two highest honours with birds of good form and well backed-up in spangles and caps. Mr. Ritchie took first honours with a good Silver, he having also won third in Golds. Mr. Bunting showed well-up for second in Silver-spangled, it being by great odds the best hen out this season. This was admitted by competent judges. The same bird has won several prizes at other shows. Mr. Fairbrass, of Canterbury, exhibited the best bird by far in the Broken-cap classes, which bird, no doubt, will be heard of again.

The *Cinnamon* prizes nearly all fell to Mr. Adams. Messrs. Moore & Wynn took third in Buff *Cinnamon*. Mr. Stewart repeated his York victory with a fine *Yorkshire* Yellow; Mr. Stevens being second. Messrs. Oliver & Holdsworth were first in Buffs. There was some trouble experienced over the *Yorkshire* Evenly-marked birds, which proved not to be so even as they ought to be. In Class 19 (No. 233), a bird exhibited by Mr. Belk had been much plucked on the right shoulder, between the shoulder and neck. In Class 20 (238), Evenly-marked Buff *Yorkshire*, a bird exhibited by Mr. Thackrey was tested and found to be painted, on the right eye in particular. The bird appeared to have beautiful eyes and splendid finish until the paint was removed.

Surely this could not have been the same bird as exhibited at Norwich. No. 240, in Class 20, also was proved to have had some of the feathers in the right wing cut off nearly close, the stumps of the pinions showing them to have been white feathers clipped off from amongst the dark ones, so as to give the smaller flight feathers in the wing a more even appearance. The bird was shown by Mr. Belk.

There were several good birds exhibited in the Any other variety class, and a very noticeable feature was the "sixes." Messrs. Mackley won an easy first with a beautiful lot of Jonques (Norwich). In the Goldfinch Mule class Mr. Bunting was first with a good one, a previous winner; Mr. Tenniswood being second with another previous winner. Mr. Cooper of Middlesborough, was third with a very deserving specimen, it being in splendid trim, marked on each eye and wing, and having a perfect clear tail. There were a few good Dark Mules, Mr. Hawman of Middlesborough being the principal winner. Class 27, Foreign Birds, Mr. Bunting was first with a fine King Parrot; second Miss E. Bowes with a Red-crested Grey Cardinal; and Mr. Calvert third with a Rosella Parakeet. Many capital Goldfinches and Linnets were shown, but Bullfinches were not so good. In the Any other variety of British birds, Mrs. E. Wallace was second with a Jay; the first-prize being the Starling, a winner of many prizes, shown by Messrs. Fryer & Holt. There was likewise a well-filled Selling class, no less than thirty-eight specimens.

The manner in which the Darlington Bird Show had been conducted admitted of no two ways of thinking. The temperature of the hall containing so many valuable specimens was studied, and the birds were well looked after. The Secretaries, Messrs. Watson and Stewart, and the Committee, appear to be the men in the right place. I left Darlington with that impression.—AN EYE-WITNESS.

Subjoined are the awards.

YORK.

BELGIANS.—1, T. M. Reid, Halifax. 2, L. Meinecke, Hull. *vhc*, J. Fawcett, Barnaby; R. Hawman, Middlesborough. *hc*, R. D. Waite, Malton; L. Belk, Dewsbury; J. Calvert, Bootham. *c*, R. J. Pope, Brighton; S. Bunting, Woodlark.

NORWICH.—*Clear Yellow*.—1, Orme & Asbley, Derby. 2, W. & C. Burniston, Middlesborough. *vhc*, J. Adams, Coventry (2); R. J. Fone, *hc*, J. Swain, Pickering; W. Smith, Birmingham. *c*, W. H. Batchelor, Whitby. *Clear Buff*.—1, W. Smith. 2, J. Adams. *vhc*, J. Adams; S. Roberts, Derby; W. H. Batchelor; T. M. Reid; G. Cox, Northampton.

NORWICH.—*Evenly-marked Yellow*.—1, W. Smith. 2, G. Cox. *vhc*, T. Clemenson. *Evenly-marked Buff*.—1, J. Adams. 2, T. Clemenson. *vhc*, G. Cox; Martin & Griffin, Northampton; W. Clarkson, Hull; Quin & Son, *hc*, J. Goode, Leicester.

NORWICH.—*Ticked or Unevenly-marked Yellow*.—1 and 2, J. Adams. *hc*, Doman & Allen, Nottingham. *c*, G. Herbert, Alcester. *Ticked or Unevenly-marked Buff*.—1, T. Tenniswood, Middlesborough. 2, J. Adams. *vhc*, J. Adams; S. Roberts. *c*, J. Swain.

NORWICH.—*Clear or Marked, Dark-crested, Yellow*.—1, G. Cox. 2, W. J. Hampton, Darlington. *vhc*, S. Roberts; Doman & Allen. *Clear or Marked, Dark-crested, Buff*.—1, Doman & Allen. 2, G. Cox. *vhc*, Doman & Allen; Garnett & Smith; York. — Briskham, York; W. J. Hampton. *hc*, R. Hutchinson, Hull; W. Howard, Harrogate; Martin & Griffin; J. Green, York.

LIZARD.—*Golden-spangled*.—1, Clemenson & Ellerton. 2, Holdsworth & Oliver, Harrogate. *vhc*, R. Hutchinson, Kirmooroad; T. M. Reid; J. Swain, Darlington. *hc*, S. Bunting. *Silver-spangled*.—1, T. M. Reid. 2, W. & C. Burniston. *vhc*, R. Hutchinson; Burt & Blenstone, Manchester; S. Bunting; Petty & Cuss, York. *hc*, R. D. Waite; Clemenson & Ellerton.

CINNAMON.—*Jonque*.—1 and 2, J. Adams. *vhc*, R. J. Pope; G. Cox. *hc*, Martin & Griffin; R. Triffitt, York. *Buff*.—1, J. Adams. 2, W. Smith. *vhc*, R. J. Pope; Martin & Griffin (2). *c*, R. Simpson, Whitby.

YORKSHIRE.—*Clear Yellow*.—1, R. J. Stewart, Darlington. 2, J. Myers, Baildon. *vhc*, J. Thackrey, Bradford; J. Fawcett; J. Calvert. *hc*, Holdsworth & Oliver. *Clear Buff*.—1, J. Myers. 2, J. Fawcett. *vhc*, Holdsworth & Oliver; J. Myers; J. Calvert. *hc*, G. Grant, Beverley; Turner & Ellison, Dewsbury (2).

YORKSHIRE.—*Evenly-marked Yellow or Buff*.—1, L. Belk. 2, R. Hawman. *vhc*, T. Tenniswood. *c*, T. M. Reid; L. Belk. *hc*, R. D. Waite; J. H. Shepherd.

ANY OTHER CLASS OF CANARY.—1, J. Garbutt, Great Ayton. 2, J. Smeaton, Berwick-on-Tweed. *vhc*, W. & C. Burniston; J. Adams; J. Smeaton; J. Fawcett; L. Belk; R. E. Triffitt. *hc*, J. Shackleton; Burt & Blenstone; J. Myers; Quin & Son; R. E. Triffitt.

SELLING CLASS.—1, Orme & Asbley. 2, W. H. Batchelor. *vhc*, J. Adams; S. Roberts; Orme & Asbley (3); W. Clarkson, *hc*, R. Simpson; J. Thackrey; T. Clemenson; G. Cox. *c*, Martin & Griffin; Clemenson & Ellerton.

CAGE OF SIX CANARIES, IN VARIETY.—1, T. Clemenson. 2, J. Calvert. *hc*, J. Dawes, Scarborough. *c*, R. Reed, Walmgate; Garnett & Smith; Petty & Cuss.

GOLDFINCH MULES.—*Marked*.—1, W. & C. Burniston. 2, S. Bunting. *vhc*, W. Lister, Malton; Harland & Son. *Dark*.—1, G. Cox. 2, S. Bunting. *hc*, J. Shackleton; R. Hawman; J. Goode. *c*, W. Lister.

BRITISH BIRDS.

GOLDFINCH.—1, G. Cox. 2, H. West, Darlington. *vhc*, J. H. Shepherd; Garnett & Smith. *hc*, J. Rookledge; W. & C. Burniston; T. Tenniswood. *c*, W. Carrick.

BULLFINCH.—1, W. Lister. 2, W. & C. Burniston. *hc*, C. Hodson; Burt & Blenstone; H. Garbutt, Great Ayton; J. Calvert.

LINNET.—1, W. & C. Burniston. 2, W. Carrick. *hc*, H. West; R. D. Waite; W. & C. Burniston; J. Butterworth. *c*, J. Cudall.

JUDGE.—Mr. G. J. Barnesby, Derby.

DARLINGTON.

BELGIAN.—*Clear, Ticked, or Variegated Yellow*.—1 and 2, J. Rutter, Sunderland. 2, R. Hawman, Middlesborough. *vhc*, W. Bulmer, Stockton; J. Rutter (2); Sergeant-Major Paxton, Ulverston. *hc*, J. Hart, Stalybridge (2); J. Rutter (2); S. Tomlin, Baston. *Clear, Ticked, or Variegated Buff*.—1 and 2, J. Rutter. 2, Sergeant-Major Paxton. *vhc*, W. Bulmer; J. Moffat, Ulverston; J. Rutter (3); J. Moorhouse, Bradford. *hc*, J. Hart; J. Moffat; J. Rutter. *c*, J. Sumnerhill; W. Bulmer.

NORWICH.—*Clear or Jonque*.—1 and 2, J. Adams, Coventry. 3, G. & J. Mackley, Norwich. *vhc*, C. J. Salt, Burton-on-Trent; J. Adams; Orme & Asbley, Derby. *hc*, C. J. Salt (2); G. & J. Mackley. *c*, C. J. Salt; W. Simpson, Cockerton. *Clear Buff*.—1 and 2, J. Adams. *vhc*, G. & J. Mackley; J. Adams. *hc*, C. J. Salt; G. Cox, Northampton. *c*, C. J. Salt.

NORWICH.—*Jonque, Evenly-marked*.—1, Brown & Gayton, Northampton. 2, J. Adams. 3, Moore & Wynn. Northampton. *vhc*, T. Clemenson, Darlington; G. & J. Mackley (2); Moore & Wynn; G. Cox. *hc*, C. J. Salt; Sergeant-Major Paxton; J. Adams. *Buff, Evenly-marked*.—1, J. Adams. 2, G. Cox. 3, G. & J. Mackley. *c*, J. Salt; G. & J. Mackley; J. Adams.

NORWICH.—*Ticked or Unevenly-marked Jonque*.—1, 2, and 3, J. Adams. *vhc*, G. & J. Mackley. *hc*, Moore & Wynn. *Ticked or Unevenly-marked Buff*.—1, 2, and 3, J. Adams. *vhc*, Clark & Newton, Nottingham; C. J. Salt (2); G. & J. Mackley. *c*, J. Calvert, Bootham, York.

NORWICH.—*Any variety of Crested Yellow*.—1, R. E. Triffitt, York. 2, W. J. Hampton. 3, Clark & Newton. *vhc*, Clark & Newton; Brown & Gayton; G. & J. Mackley; G. & J. Mackley, Cockerton. *c*, Doman & Allen, Nottingham. *Any variety of Crested Buff*.—1, G. & J. Mackley. 2, R. Hawman. 3, G. Cox. *vhc*, F. J. Knages, Newcastle; Doman & Allen; G. & J. Mackley; S. Bunting, Derby; Moore & Wynn; Martin & Griffin, Northampton. *hc*, W. J. Hampton; J. Rutter; Thompson & Mount, Lancaster; G. Cox. *c*, R. E. Triffitt.

LIZARD.—*Golden-spangled*.—1 and 2, Clemenson & Ellerton, Darlington. 3, R. Ritchie, Darlington. *vhc*, T. W. W. Fairbrass, Canterbury (2); Oliver & Holdsworth, Harrogate; R. Rutter. *hc*, J. N. Harrison; G. Tuckwood, Nottingham. *c*, G. Tuckwood & S. Bunting. *Silver-spangled*.—1, R. Ritchie. 2 and 3, S. Bunting. *vhc*, G. Tuckwood; R. Ritchie; J. N. Harrison. *hc*, T. W. W. Fairbrass (2).

LIZARD.—*Golden-spangled, with Broken Cap, or Pied Wings or Tail*.—1 Clemenson & Ellerton. 2, S. Bunting. 3, T. W. W. Fairbrass. *vhc*, R. Ritchie. *hc*, Clemenson & Ellerton; R. Ritchie. *c*, G. Tuckwood. *Silver-spangled, with Broken Cap, or Pied Wings or Tail*.—1, T. W. W. Fairbrass. 2, R. Ritchie. 3, T. Clemenson. *vhc*, G. Tuckwood; R. Ritchie. *hc*, S. Bunting; J. N. Harrison. *c*, Clemenson & Ellerton.

CINNAMON.—*Jonque*.—1, 2, 3, and *vhc*, J. Adams. *hc*, C. J. Salt; J. Calvert. *Buff*.—1 and 2, J. Adams. 3, Moore & Wynn. *vhc*, J. Adams (2); G. Cox. *hc*, C. J. Salt.

YORKSHIRE.—*Clear Yellow*.—1, W. J. Stewart, Darlington. 2, J. Stevens, Middlesborough. 3, L. Belk, Dewsbury. *vhc*, J. Thackrey, Bradford; M. Toms, Darlington; H. Garbutt, Great Ayton. *hc*, Oliver & Holdsworth; J. Wilkison, Great Horton; W. Hutton, Baildon. *hc*, J. Cooper, Middlesborough. *Clear Buff*.—1, Oliver & Holdsworth. 2, G. Gott, Shipley. 3, W. Hutton. *vhc*, L. Belk; Clemenson & Ellerton. *hc*, W. Lickley, Ripon. *c*, Lennox & Renwick, Gateshead.

YORKSHIRE.—*Evenly-marked Yellow*.—1, J. Brook, Little Horton. 2, W. & C. Burniston, Middlesborough. 3, J. Wilkison. *vhc*, F. Tritscher, Harlepool. *hc*, J. Thackrey. *c*, W. Cotton, Middlesborough. *Disqualified*, L. Belk (chipped on right wing). *Evenly-marked Buff*.—1, J. Wilkison. 2, J. Hawman. 3, F. Tritscher. *Disqualified*, J. Thackrey (chipped on right eye); L. Belk (chipped on right wing).

YORKSHIRE.—*Ticked or Unevenly-marked Yellow or Buff*.—1, M. Holroyd, Great Horton. 2, W. Hutton. 3, M. Corner. *vhc*, G. Gott; G. Cooper, Darlington; W. Carrick, Middlesborough. *c*, Lennox & Renwick; Oliver & Holdsworth; J. Stevens.

CANARY.—*Any other variety*.—1, J. Brook. 2, T. Tenniswood, North Aeklam (Cinnamon marked). 3, C. J. Salt (Broken Buff Cinnamon). *hc*, C. J. Salt (Broken Buff Cinnamon); W. Bulmer (Coppiv); W. Cotton (Coppiv); W. & C. Burniston; J. Adams (Marked Cinnamon); W. Hutton; Fryer & Holt, South Stockton. *c*, R. Pearson, Wubthly.

CAGE OF SIX BIRDS.—1, G. & J. Mackley. 2, Clemenson & Ellerton. 3, T. Clemenson. *vhc*, J. Rutter; J. Adams.

GOLDFINCH MULE.—*Any description except Dark*.—1, S. Bunting. 2, T. Tenniswood. 3, J. Cooper. *vhc*, T. Alceby, Durham; H. Nevison, Willington; Hampton & Chamberlain; S. Bunting; K. Pearson; H. Thompson & Mount. *Dark Jonque or Buff*.—1, R. Hawman. 2, G. Cox. 3, J. Wilkison. *hc*, F. A. Parker. *c*, S. Bunting.

FOREIGN BIRDS.—*Any variety, including Parrots, Parakeets, Pheasants, Larks, &c.*.—1, S. Bunting (King Parrot). 2, E. Bowes, Darlington (Red-crested Grey Cardinal). 3 and *vhc*, J. Calvert (Rosella and Australian Parakeets). *hc*, W. Hampton (Parrot); W. Hodgson (Parrot); Miss C. Bowes, Darlington (Budgerigars); T. Iddison, Darlington (Parakeet). *vhc*, T. Tenniswood. *hc*, R. Hawman. 2, H. West. 3, S. Bunting. *vhc*, T. W. W. Fairbrass; H. Nevison; W. & C. Burniston; W. Carrick. *hc*, J. Cooper. *c*, F. A. Parker, Burton-on-Trent.

BROWN LINNET.—1, J. Bage, Middlesborough. 2, T. Allenby. 3, W. Carrick. *vhc*, J. Bage; H. Nevison; S. Bunting.

BULLFINCH.—1, Withheld. 2, J. Rowland, Skilton-by-the-Sea. 3, H. Nevison.

BRITISH BIRD.—*Any other variety*.—1, Fryer & Holt. 2, Mrs. E. Wallace, Darlington (Jay). 3, H. West, Darlington (Starling). *vhc*, T. Iddison (Starling); Mrs. E. Wallace (Starling). *hc*, Rev. G. Herbert, Bilford (Reed Bunting); O. A. Watts, Brixton (Blackcap); W. & C. Burniston. *c*, G. Cox.

SELLING CLASS.—1, T. Clemenson. 2, Moore & Wynn. 3, J. Adams. *vhc*, G. Cox. *hc*, Clemenson & Ellerton; Orme & Asbley (4). *c*, Clark & Newton; W. & C. Burniston; Clemenson & Ellerton; T. Clemenson; Martin & Griffin; Moore & Wynn.

SPECIAL EXTRA PRIZES.

For the best bird in classes 1 and 2, J. Adams.
For the best bird in classes 3 to 8, J. Adams.
For the best bird in classes 9 and 10, G. & J. Mackley.
For the best bird in classes 11 to 14, Clemenson & Ellerton.
For the best bird in classes 15 and 16, J. Adams.
For the best bird in classes 17 to 21, W. J. Stewart.
For the best cage of six, G. & J. Mackley.
For the best bird in classes 22, 23, and 24, S. Bunting.
For the best bird in classes 25 to 31, Fryer & Holt.
For the best bird in class 32, T. Clemenson.

JUDGE.—Mr. G. J. Barnesby, Derby.

SNEINTON (NOTT'S) CANARY SHOW.

On Saturday and Monday, the 21st and 23rd inst., a very good Show, being the annual one of the Nottingham Bird Society, took place at the Albion Hotel, Sneinton, Nottingham. The birds exhibited were almost solely confined to the Norwich breed, of which there were nine classes, and two classes for Lizards. The Exhibition proved an entire success, and was well patronised. The Honorary Secretary, Mr. A. Duke, with the assistance of a good working Committee, deserve all praise for their exertions. During the morning a dense fog prevailed, and judging was somewhat delayed, the public not being admitted (aye, not even the members of the press) until about one o'clock. Every facility was then rendered to the press in gaining the requisite notes, which proved to be a somewhat better plan than dodging about the elbows of a Judge during the discharge of his duties; this with numberless questions asked (especially if the "chief" taking notes is not well up), causes considerable delay.

There were many good specimens of the Clear Yellow, Clear Buff, and Marked, and Crested Norwich birds in the Show; the

prize birds in the two former classes especially being all that could be desired. They certainly were not so high-coloured as some exhibited at many of the previous shows, but for breeding purposes they were equal to anything. Considering that the first high-coloured birds originated from Nottinghamshire, I fully expected seeing something sensational.—AN EYE-WITNESS.

The following are the awards.

NORWICH.—*Clear Yellow*.—1 and 3, A. Duke. 2, E. Horsley. 4, W. Greaves. *Clear Buff*.—1 and 3, A. Duke. 2, W. Greaves. 4, J. Parr. *Ticked Yellow*.—1, J. Greaves. 2, H. Roe. 3, J. Baxter. 4, F. Nevett. *Ticked Buff*.—1, A. Duke. 2, F. Nevett. 3, J. Parr. 4, H. Roe. *Variegated or Even-marked Yellow*.—1, T. Clarke. 2, A. Duke. 3, T. Smeeton. *Variegated or Even-marked Buff*.—1, T. Clarke. 2, T. Smeeton. *Crested Yellow*.—1, G. Doman. 2, W. Elliott. 3, E. Horsley. 4, E. Garton. *Crested Buff*.—1, G. Doman. 2, W. Elliott. 3, E. Garton. 4, H. Flower.

LIZARDS.—*Golden-spangled*.—1, T. Smeeton. *Silver-spangled*.—1, T. Smeeton. *Selling Class*.—1, W. Greaves. 2, A. Duke. 3, E. Garton. 4, W. Elliott.

JUDGE.—Mr. G. J. Barnesby.

THE WASHING OF CAGE BIRDS FOR EXHIBITION.

(Continued from page 373.)

In continuing the remarks upon the subject of washing and preparing birds for show Mr. Barnesby says, "One advantage is to get through the operation as speedily as possible, keeping the birds warm the whole of the time. Do not have the water beyond blood heat for fear of injuring them, and previous to washing place in each bowl a small piece of soda (the size of a French bean), which assists in getting the dirt well out of the feathers. It will occupy about six or eight minutes to wash each bird, and from twenty minutes to half an hour drying. Have a good fire to dry with, but be careful not to place the birds too near for fear of burning them. When one is washed and placed in the drying cage proceed to operate upon another. As you find the first washed become dry, transfer them to another cage; this will prevent the early-washed birds from soiling the others, and will afford more room in the drying cage for the remainder. One drying cage will be sufficient for a dozen or upwards to become dry in." The foregoing extracts will suffice to convince fanciers that the washing process information is not just dawning forth.

In my earlier days of bird-breeding I well recollect an ardent lover of one of the choicest of breeds (the London Fancy) writing me stating it was "washing day" with him. I was temporarily in the dark as to what he meant. I must admit I didn't see it all at a glance, but I afterwards found out, and let someone else know. I often think I've a happy knack of letting out the secrets of the fancy. And why not? If men are straightforward and honest and pay their way to the very shilling (I was going to say farthing, but shilling will do), why should they be kept in the dark? I believe in getting possessed of as much knowledge as possible respecting the fancy, and not confining the matter to a few. The fancier above alluded to used to operate with the washing process never less than a week before he exhibited his birds. Now, I do not altogether fall in with this. Three days beforehand I think a nice time, for, if washed a week before showing, the birds' feathers will become contaminated with the smoky accumulations in the atmosphere.

Mr. Barnesby again states, "Birds kept in the country away from the smoke of a town very rarely require so much cleansing; but keep them how you may in a neighbourhood where there is much smoke, you cannot, even with close covering-up, prevent birds becoming soiled and dirty in plumage."

I have known fanciers wash their birds just prior to sending them off for show, but this is trying nature too much. By all means allow the birds time to recover from the effects of "soap in my eyes," as I have heard my youngsters announce to those who have been washing them. Three days beforehand is a nice period, and then you can have a little time to spare to give the birds a cold bath, which tends to place their feathers "as they were." Before placing your birds in the already cleaned and prepared show cages, see that there is no dust whatever in the cages; let them be as clean as pinks, and then you will not feel annoyed by seeing the foreheads and the end of the wings and tails soiled. This is all of vast importance in assisting you to win with your birds. Light-plumaged birds will soon show you the ill effects of being placed in dusty cages. Whilst the birds are in the show cages, prior to being safely packed up for departure keep them slightly covered over with some light cloth. Your wives, no doubt, will be able to assist you in this respect, especially if you treat them kindly, and make them a suitable present out of the winnings—if any.—A FANCIER.

MR. D. STEWART.—We regret to have to record the death of Mr. Daniel Stewart, of Perth, which took place on the 8th inst. Mr. Stewart was one of our best Scotch fanciers—one of the old Scotch Pouter breeders—and he was most successful. He was also for many years a breeder of Canaries of the "Scotch fancy," was long celebrated for his fine birds, and generally carried off the highest honours. Mr. Stewart was one of the most unassum-

ing men we ever knew, slow to bring himself into notice, always ready to listen and learn. His kind gentle manners and naturally amiable disposition endeared him to all who knew him, and his clear and sound judgment were always at the service of his friends. Mr. Stewart has been taken away, much regretted by his friends in the fancy, as well as by a large circle of others, and happily prepared for the great change.

NORWICH AND EAST ANGLIAN BIRD SHOW.

THE Norwich Show was an exceedingly fine one, bringing together many of the best birds in the country. The Exhibition, which was held in St. Andrew's Hall by the kind permission of the Mayor of the city, was the largest for cage birds yet held this season, no less a number than 840 birds having been entered for competition. Mr. Jacob Mackley proved himself to be a very able Secretary.

To attempt to enter fully into the merits of all the prize specimens, now that there are so many exhibitions being held, would occupy more of our space than we can well spare. Suffice it to say that the Canary classes of the Exhibition were well filled, the first twelve classes of the various breeds of Norwich being tenanted with 209 birds. There were twenty-one Belgian specimens, thirty-three Lizards, thirty-five Yorkshires, twenty-four Manchester Copsy or Plain Heads, thirty-two Cinnamons, forty-six Mules, the remaining classes being devoted to groups of six birds in each cage—British birds, birds of passage and migratory birds, foreign birds, a Selling class, with upwards of eighty in it, and fourteen cages containing stuffed specimens. Altogether the number of classes extended to over eighty. From this some idea may be formed of the magnitude of the Show. Messrs. G. & J. Mackley, of Norwich, alone entered 164 birds, and they were the winners of the silver cup presented by the Mayor of the city. Mr. J. Adams, Coventry, entered twenty-six; Messrs. Athersuch & Son, Coventry, twenty-one; Mr. Walter, Winchester, twenty; Mr. F. Alden, Norwich, seventeen; Messrs. Provart and Willis, seventeen; Mr. W. B. Hovell, Norwich, twelve; besides numerous others who brought up the rear in a very spirited manner. Although Messrs. Mackley Brothers entered so largely in the Norwich classes, Mr. Adams held his ground wonderful, but he was defeated by a majority of twenty-three points for the cup. Messrs. Athersuch & Son also exhibited many first-class birds, and obtained several high honours. In the Crested Norwich classes Messrs. Mackley were the principal winners, and these birds assisted chiefly in winning for them the special prize. There were a few good Belgians exhibited, and some excellent Lizards likewise. The eight prizes in the Cinnamon classes all fell to the lot of Mr. Adams. The Mules alone were worth seeing, many of the choicest specimens in the kingdom gracing the stages. The chief prizetakers were Messrs. Hawman, Hampton & Chamberlin, Wilkinson, Spence, Hutton, Stevens, Goode, and others. In the group of six Norwich Canaries, Messrs. Mackley took first, second, and third prizes. In the Lizard sixes there was no competition. The catalogue and prize list, which reflects credit on all who had the arranging and printing of it, was issued in good time for post (a most essential matter), thus preventing any disappointment to the exhibitors, and saving annoyance, extra expense, and correspondence to both the Committee and Secretary. The Exhibition was well backed up with a long list of patrons, and possessed an able and practical Committee of Management.

CURE OF CHICKEN CHOLERA.—Take of essence of Jamaica ginger one table-spoonful and put it into enough of water to mix into dough one quart of meal, and feed three times daily. The essence of ginger can be procured of any druggist. This is said to be unfailing.

BYGONE BEE-KEEPING.

I WAS brought up and lived until twenty-four years of age in a small hamlet in Shropshire, where there were from thirty to forty cottages within a radius of about half a mile, every occupier of which kept bees. The householders were chiefly labourers, not earning more than 7s. to 10s. per week; the rents ranged from £3 to £5 per year, which they reckoned to pay from profits on their bees. Boxes were then unknown for bees; the villagers had but few straw hives, they made hives from osiers, each making his own in the long winter evenings. When the osier work was sufficiently dry they plastered the hives over with a mixture of half lime and half cowdung, when they were ready for use. The men, being away from home all day, the women generally managed the bees, so the people had a notion that the bees would not work for two masters. If a member of the family died some one had to go and tell the bees, otherwise it was thought these would all die.

If you looked over the garden you would see a few osiers growing in some corner, and amongst them straight pieces left about a foot long, which the cottagers called foundations for

future hives; the shoots breaking out round the top of the straight piece were trained for side supports. The straight piece formed a handle at the top of the hive. Straw was tied-up at one end like a birch-broom for a covering in winter, which was called a hackle. The loose ends of the straw were opened out round the hive, pressing the tied-up end down upon the peg at the top, and then tying it round with string. This was all the covering afforded. I have known as much as £10 made from bees in a favourable season. I knew one poor old widow, with a son a cripple, who would have had to end her days in the Union if it had not been for her bees. Since writing before, I have read in a book on insect architecture an account of black bees. One hinks them old worn-out workers; the other, that they are young bees, caused by some defect in the interior of the hive; he last is my own opinion, as they all appeared to be young.—J. R., a Working Gardener.

HIVES.

MR. PETTIGREW appears to be a very practical man, and as a gentleman argues with good temper, and, I believe, is solely actuated by a desire to express his honest conviction, for the benefit of the readers of this Journal, that straw is better than wood for a bee hive. In this opinion he is far from being alone; and I assert, whether "B. & W." considers it *reasonable* or *unreasonable* contradiction, that wooden hives are not so profitable in their results as straw hives; and further, I cannot agree with "B. & W." that in point of interest and perfect mastery of the science of bee management, the wooden and the bar hives carry the day. I maintain that during the summer it does not matter so much what the material of the hive is, but in winter it is of great importance. In summer a wooden hive is more likely to have its combs melted by the heat than a straw one would be, on account of the greater conducting power of wood; and for the same reason straw, being a bad conductor of heat, is less likely to part with its internal warmth in winter. Wood, also, presents a colder surface inside the hive than straw; therefore more of the moisture arising from the bees is condensed in a wooden hive than a straw one. The conclusion is, that a straw hive, whether lined with propolis or not, is in winter both warmer and drier, consequently more conducive to health in the hive and ultimate profit.

As to the Crystal Palace Show, it is well known there was no exhibition of straw hives, therefore no comparison could be made; and if there had been, it is quite possible to get as much honey from a wooden box as a straw hive if the internal dimensions are the same. The true test of the value of either is in its suitability as a winter protection to the bees. Many bee-keepers keep their opinions of the straw hives to themselves, but prove their appreciation of them by using scarcely any other.

In the true interests of economical bee-keeping I hope this controversy will not cease, but that by the aid of controversy bee-keepers may at last become convinced by the truth of plain facts, either that the old straw hive made of a larger size with a 4-inch hole at the top, or a wooden box, is the most "profitable" hive in which to keep bees. I say nothing about bar frames, because that I think is not at the present moment the question.—APICULA.

THE well-timed remarks of your able correspondent "B. & W." in your last issue must have come home to the sympathies of many of your readers. The repetition by Mr. Pettigrew of his view of the relative merits of hives may well now have a pause; but I cannot restrain a remark or two in reference to his critique upon bar-frames. Let me first say that the whole premises of whatever argument there may be connected with his assertions is erroneous, since it seems to be taken for granted, if in the absence of the bee-master or any system of management, bees can and will store an equal amount of honey in a skep as in a bar-frame hive, the utility, or at least the superiority, of the latter is disproved.

The mobility of frames gives the bee-keeper who understands his art, the power of enormously distancing anything that even the Pettigrew skep can accomplish; but all will freely admit that if the hive be in the hands of those unable to take advantage of the character of its construction, it will not surpass good hives with fixed combs. The tyro can discompose music as sweet upon a barrel organ as the most accomplished musician can elicit; and, from much the same cause, with skeps the beginner and the bee-master are upon pretty equal footing. Hence many in the first year of their apprenticeship are "fully convinced of the superiority of the Pettigrew hive;" but when we remember that with moveable combs we can equalise stocks both in bees and stores; cut out queen cells and prevent casting; stop the raising of unnecessary drones; swarm artificially with extreme ease and certainty; raise queens in nuclei, and subsequently restore the combs and bees to stocks from which they were taken; ascertain the absence of queens, disease, &c., by simple inspection; easily insert new queens; promote breeding by enlargement of the brood nest; throw out honey by the

slinger, &c., can we doubt which is the hive for the bee-master? and who keeping bees does not desire to progress and become one?

Mr. Pettigrew, however, concedes that we are improving the bar-frame hive in removing the bottom rail of the frames, which he says enables the bees to make their combs $1\frac{1}{2}$ inch longer. The $1\frac{1}{2}$ inch should have been half an inch. But let this pass. Singularly the "doubtless" improvement upon which Mr. Pettigrew alights is the alteration above all others recently introduced, which is only on its trial, and which many whose opinions must be respected regard as a defect. At least the following objections may be taken to it.

When the swarm is placed in the hive the bees' warmth and moisture soften the wood, and should their weight pull down the centre of the bar one-tenth of an inch (the calculation is made for the Quinby size), the uprights are played a quarter of an inch, and brought into contact with the hive-side to be immediately propolised. The bees also will occasionally attach their combs to the bottom board. In one of my hives this summer ten queen cells which I desired to insert in nuclei were built on the bottom of a comb so near the rail that I could not cut them out without risk, and so the rail was at once removed. Soon afterwards this frame was fixed, and upon pulling it out I found the comb built to and attached upon the floor board, so that some length of it was broken off. It is moreover not proved that the bottom rail is a disadvantage. Experience has shown that good ventilation beneath the combs greatly aids in wintering; and while comb-building, the bottom rails give the bees forming the last rounds of the living ladder convenient standing room without at all interfering with the busy journeyers beneath.—F. CHESHIRE.

CRUDE HONEY.

WHAT is honey? Mr. Pettigrew says it is a substance which bees gather in the flowers. It is a liquid crude syrup, which gets its peculiar flavour from the plant, this flavour existing in the syrup found in the flowers. To this definition of honey he further adds that its crudeness is removed by the bees, who "sweeten as well as thicken the syrup or nectar," and that "after it has been twice swallowed and disgorged it is perfect, whether found in the combs sealed or unsealed."

Although Mr. Pettigrew satisfactorily answers my question as regards the taste of honey, I cannot be sorry I put it to him in the interests of scientific knowledge, because it has elicited from him a fuller statement of what I must call his wonderful discovery as to the origin of the richness and sweetness of honey. The source of it all is to be found in the stomach of the bee. There the acrid substance gathered in the ivy blossoms, as well as the nectar extracted from the million flowers of spring, find their sweetness. Now, to believe this it is necessary to believe that the stomach of the bee possesses a reserve of saccharine matter of most extraordinary quantity or concentrated power, considering that honey is little else than sugar slightly diluted. Does Mr. Pettigrew believe this? Imagine the stores of sugar which a hive of bees on this theory contrive to carry about with them night and day, for it must lie hidden somewhere within the body of the insect. Hitherto we have supposed that sugar has been one of the peculiar bounties of mother earth, the true "extrait de millefleurs," the elixir of life, which constitutes the excellence and nutriment of all the vegetable produce of our fields and gardens, from the delicious blades of summer-grown pastures, whence the rich milk and butter and cheese of our dairies, up to "bread that strengthens man's heart." Not so, quoth Mr. Pettigrew, at least in the exceptional case of the sugar in honey; that is elaborated within the body of the bee. There is little or no sugar in the crude and liquid substance which flowers give forth; that is a vulgar error of the nineteenth century. They "sweeten" it within their own stomachs "after it has been twice swallowed and disgorged!"

I should not have referred to the matter again if, as in the case of stick-and-straw hives, Mr. Pettigrew had not again thrown down the gauntlet by his repeated advancement of a mere theory of his own, as if it were an undoubted fact, as fully demonstrated as a mathematical truth. I am tempted to ask him in conclusion, why it is he advocates the feeding of bees with such quantities of sugar? Would it not be sufficient to supply them with a decoction of ivy leaves macerated in water? After swallowing and disgorging this a sufficient number of times it would become "perfect, whether found in the combs sealed or unsealed."—B. & W.

OUR LETTER BOX.

CRYSTAL PALACE SHOW.—The address of Miss Pasley, who took a prize, is Moorhill, Farcham, Hants. Mrs. Cross, who won the second prize for Crève hens, resides at Appleby Vicarage, near Bigg, Lincolnshire. Mr. T. Wakefield took the fourth prize for Ronen Ducks.

YARMOUTH POULTRY SHOW.—You state that the majority of cups can only be won by local exhibitors. Such is not the case. If you refer to our schedule you will find there are only four local cups—three for poultry, and one for Pigeons.—F. W. MARSHON.

WHITE COCHINS (Ignoramus).—The first thing you have to do is to select your best birds. Size is an essential for Cochine-Chinas. Combs, both in cock and pullets, must be quite straight; the serrations stiff, upright, and well defined. Both or all the birds in the pen should match exactly in colour. Avoid mealy winners in the cock, or anything like necklaces in the pullets. No culture books. The birds intended for exhibition should be put by themselves, not only because they want to be more cared for than the run of the poultry, but in order that when they are confined in a small pen they may agree. If you can do so, make them a small run by themselves. Feed them on ground oats slaked with milk morning and evening, with kitchen or table scraps in the middle of the day. If you have no run that affords grass, give them every day two or three large sops out with plenty of earth. You may also throw into their run at times eighteen or twenty grains of Indian corn or barley, odd scraps of bread, or anything of the sort. They must not have food by them. Some dry road grut under cover is a good thing for them to dust in. As accidents will happen, it is not safe to trust to one pen only; you will, therefore, be wise to have two ready, and, if all go well, you can then send the best. If at any time you think you will break up and re-make the pens by changing birds from one to the other, the alteration should be made a week before they leave for exhibition. There is no hope for success where the cock beats his hen. It is only under exceptional circumstances fowls want washing. You may, with a piece of flannel wetted with soap and water, wash the feet and the unfeathered parts of the legs.

CHICKEN MANAGEMENT (E. W.).—Do away with the sawdust. They pick it up, and it is bad for them. What is the floor under the sawdust? Your food is very bad. You will never have healthy birds while you feed on potatoes. If you have no farmyard where the chickens can feed, they should be fed by hand three times per day. They should have barley meal or ground oats slaked with milk or water twice per day, morning and evening. They may at midday have scraps of bread or meat, or whole corn, maize or barley, more of the latter than the former. As we should be disposed to believe your fowls are choked with sawdust, we advise you to give each of them a table-spoonful of castor oil, and then to feed as we have advised.

PARTS OF FOWLS (A. P.).—In a recent number (No. 686) we have published engravings with references showing the names of all the parts. In a previous number we also published an engraving of a vulture hook.

HENS PLUCKING THEIR MATE (L. J. R.).—Take him from the hens and let them run alone. Turn him among them every morning for half an hour before they are let out. Watch him and them. It is very likely there is only one offender. If it be so, take her away, and then let him run with the hens.

ORNAMENTAL WATERFOWL (T. H. T.).—You will not be able to buy any of the common wild fowls till next February or March, when they come from Holland, nor is it advisable to do so, as it is a trying time with fresh birds when the water is frozen. The precautions you mention are not necessary when the birds arrive. If they are in good condition they may be turned at once on to the water, care being taken that they shall at once find food there. Bread is the best for this purpose, because it swims. You have only one thing to avoid, that is handling them. Take the basket near to the water, cut it open, and let them run out. We should advise the netting 3 feet high. They cannot climb a bank 2 feet high, but, as we stated before, there must be landing places cut through such a bank, or the birds will drown. Black East Indian Ducks need not be pinioned, Carolina Ducks must. Ducks want no roosting places beyond the shelter of the shrubs. They will choose the spots that afford most protection. Unless the Carolinas have boxes they will not breed, because they will drop their eggs about.

FATTENING TURKEYS (G. M.).—Turkeys that are intended for Christmas should not yet be shut up, but you may help them along by feeding them well on nourishing food, such as ground oats mixed with milk, and a portion, one-tenth part, of pea meal. They may be put on the same when they are shut up. They put on great weight in the last month.

KILLING COCKERELS BEFORE PULLETS (J.).—You ask why we always advise to kill cockerels before pullets. Because they attain size earlier; because they become hard earlier than the pullets; and finally, because not being egg-producers, they can make no return for the food they have eaten.

LARK DISORDERED (L. C.).—We fear the symptoms indicate inflammation of the bowels. Feed on bread and milk. Put two or three drops of sweet nitre into the water, and let the bird eat as much lettuce as it will. We fear your bird has been too long afflicted to permit a strong hope of its recovery.

FLOORBOARDS OF HIVES (J. L.).—Clean the floorboard of each hive by scraping it with a knife, and brushing it afterwards with a dry brush, and see that each hive stands firmly on its pedestal, and is well defended against wet; and, for effecting this especially during winter, we have never yet found anything equal to the milk-pail, heavy and unsightly as it is unquestionably is.

ENTRANCES OF HIVES (Edward).—The entrance to the hives must now be narrowed, so that only two or three bees can come out at the same time; for, at this season, mice are very likely to lodge themselves in the hives, and they are very hurtful and destructive to the bees; for, having once lodged themselves in a hive, its entire destruction will be effected by them in a few days.

RAVENS, &c. (A Constant Reader).—We do not remember what you refer to.

HOESE-KEEPERS' BOOK (An Old Subscriber).—We never published one.

TERRIER DISTEMPERED (P. M. N.).—Five four grains of blue pill, and a dessert-spoonful of castor oil four hours afterwards. Keep the dog from being chilled. Feed on bread and milk until well. You feed the dog too much on the meat you name.

COVENT GARDEN MARKET.—NOVEMBER 25.

A fair supply is kept up, and the attendance is quite equal to former years at this season. A fresh arrival of Pines from St. Michael's has just been offered by the brokers in good condition, prices ranging from 15s. to 21s. each. Hot-house Grapes have slightly advanced in price.

REMARKS.

- 11th.—Bright, cold, but very fine day.
 12th.—Very bright pleasant day, but the wind very cold.
 13th.—Rain in the morning, but fine afternoon and night.
 14th.—White frost early; fine but not bright in the after part of the day.
 15th.—Raining damp morning; dull wet day throughout, but rather better at night.
 16th.—Fine sunny morning, dull afternoon, and wet at night.
 17th.—Dull damp morning, getting gradually better; very bright afternoon, and fine evening, but wet night.
 Much colder than last week, and frost on most nights. Air frequently very damp.—G. J. SYMONS.

REMARKS.

- 18th.—Rain in the night and morning; damp and all but raining all day; much warmer.
 19th.—Fine morning, but rather hazy; rain before 11 A.M.; very bright for an hour or two in the afternoon; dull evening, but fine night.
 20th.—White frost in the morning, splendidly bright at noon, and very fine all day and night.
 21st.—Foggy till noon, then brighter till between 2 and 3 P.M., when it was very thick, but not as dark as it is sometimes.
 22nd.—Foggy all day, particularly so in the early afternoon, but cleared off about 8 P.M.
 23rd.—White frost and rather hazy, but soon cleared off; a splendid frosty day and moonlight night.
 24th.—Still frosty; a dull hazy day without rain or sunshine.

Rather sharp frost during the last two or three days, producing, in conjunction with the fog, two irregular phenomena. (1) The minimum temperature on the 21st was lower in the air than on the grass, because the latter was kept warm by proximity to the soil. (2) The temperature in the sun was lower than that in the shade on the 24th, because, though the sun was wholly obscured, there was occasionally clear sky in the zenith; therefore the sun thermometer was cooled by radiation, while it was not raised by sunshine.—G. J. SYMONS.

From observations taken near London during forty-three years, the average day temperature of the week is 47.7°; and its night temperature 35.9°. The greatest heat was 63°, on the 7th, 1856; and the lowest cold 13°, on the 8th and 9th, 1867. The greatest fall of rain was 1.02 inch.

PERPETUAL ROSES.

It is a long time since I sent a line to your columns, and as they of late have contained but scant allusion to Roses, I think in this gloomy season it would be interesting to many readers of "our Journal" if some of the large Rose-growers were to give their experiences as to the "perpetual" qualities of Roses called "Hybrid Perpetuals."

Now it is very evident that many so called do not bloom twice, such as Miss Ingram, Boule de Neige, &c. I am aware that Miss Ingram is properly a summer Rose, but Keynes and others place it in their catalogues among the Hybrid Perpetuals, and so people who are not well acquainted with Roses are often misled.

My object in writing is to point out what are the most constant bloomers in my collection. First and foremost, then, with me is Abel Grand; except Lamarque on a south wall no Rose is earlier, and no Rose blooms later than this charming silvery pink one. Next to it, among the Hybrid Perpetuals, is the coarse and by many discarded Rose Souvenir de Julie Gonod. This in my nursery is as full of bloom as a Gloire de Dijon in summer. Then come Marie Baumann, Mlle. Eugénie Verdier, La France, and Charles Lefebvre. Among the Teas Madame Willermoz is wonderfully perfect, I could send you blooms picked on the 23rd of November which are really exquisite. Niphetos, also, is a very constant late bloomer, and the new and ever-charming Marie Van Houtte.

Hurrah for the Teas! Messrs. Editors. Mr. Cant writes me word that his orders for Teas are so overwhelming that he literally cannot send me the trees that I ordered of him at the Crystal Palace Rose Show! He has to beg for time till he can scour the country for Teas. How refreshing such intelligence is to me in this dull November weather you may understand; for I feel sure that we shall see more Teas in our boxes at next year's shows.

What a wonderful autumn [this was dated November 26th] we are having! In my churchyard at the present time there are the following flowers and shrubs in bloom: Gladiolus, Clematis Standishii, Clematis Rubella, Passiflora carulea, Veronicas, Rhododendron (Amilcan) second time, Myrtle, Rose Madame Trifle, and various Hybrid Perpetuals, and of course Chrysanthemums. Strawberries are in flower, and their fruit setting, so that if there is no frost we may, perhaps, gather fruit on Christmas-day; and Peach trees are covered with bloom buds. But everything points to but one sad end—a late, yes, very late spring frost, and if that comes like it has for three years in succession here, where shall we be? The answer is, "Up a tree."—J. B. M. C., Charmouth.

[Our correspondent adds this postscript:—]

"It has nothing to do with Roses nor gardening, but I cannot resist sending you the following true anecdote, which you can insert or not as you please. At my native

No. 714.—VOL. XXVII., NEW SERIES

place in Yorkshire the good folk have lately erected a grand large organ in the parish church, with all the newly-invented combinations, composition pedals, &c. The old organist who had for a quarter of a century played at the church was considered unable to manipulate the new instrument, and was pensioned-off. It happened, however, that the new organist was a non-resident, who, in order to catch the last train, had to leave before the evening service was over, and who consequently left his predecessor to play the last hymn. As the old man was not equal to playing the pedals, he gave him directions to make the bass as loud as was needed to make up for the want of the pedal pipes. This the old man did to such a wonderful extent that when he began, it was *bass et præterea nihil* (all bass and no treble). In despair the poor old fellow put his foot on a composition pedal, in the hope that the builder's ingenuity would make it all right. But such a hideous screech came next that he stopped suddenly, and from the organ loft a voice broke the awful silence, declaring in piteous but exceedingly distinct tones, 'I can make nought of it.'

[Our correspondent says this has nothing to do with gardening, but we fancy that what he had just written about a late spring frost suggested the anecdote, because then every outdoor-Rose gardener, like the organist, may truly exclaim, "I can make nought of it."—EDS.]

WINTER CUCUMBERS.

As Mr. Taylor has written so well on this subject, I venture to give the culture as practised here, and its results.

The seeds are sown four in a 48-sized pot, and placed in a temperature of 70° by night, and 75° by day, sun heat 80°. As soon as the first rough leaf is formed the seedlings are potted singly in 60-sized pots, and repotted again if the house is not ready for their reception. Before I proceed further I will describe a little what the house is like. It is a small lean-to, separated from the plant stove by a glass partition, and faces due south, but owing to a building directly in front the sun does not strike on it at this time of the year until about two in the afternoon, which of course is a drawback. A flow and return pipe runs under the bed for bottom heat, and is covered with brick rubble, &c., and a flow and return passes round the bed for top heat. The house is directly over the stokehole, which has a considerable amount of piping, consequently there is no lack of heat.

The compost used is a mixture of leam, leaf mould, and dung from an old spent hotbed. This being placed on the brick rubble, and left a day or two to get warm, the plants are then inserted along the centre of the bed, and watered to settle the soil about their roots, and a temperature of 70° by night, 75° to 80° by day, and 85° by sun heat is maintained. The plants grew vigorously for a time, and produce two or three good fruit, and then seem worn-out, and I think, with Mr. Taylor, that the high temperature has a great deal to do with their ceasing to

No. 1366.—VOL. LII., OLD SERIES.

bear so soon; but I am acting under another's direction, I cannot use my own judgment. If I could I would certainly give Mr. Taylor's plan a trial.

The house is kept well damped down, but in spite of this the red spider continues to trouble us. Syringing is then freely applied to destroy this troublesome little pest; then mildew follows, when we use flowers of sulphur distributed on the leaves through a muslin bag; but as soon as we get clear of one pest we get another as bad, and an ever-watchful eye is needed to keep them clear and in good growing order.

Would it not be better if there were two pipes round the bed for top heat, as the water in them has often to be kept boiling to maintain the required temperature, rendering the atmosphere hot and dry? The variety used here is Rollisson's Telegraph.

Permit to ask others who maintain this high temperature if they meet with good results. I for one, and no doubt many more young gardeners, would be glad to learn the right way to grow good Cucumbers during the winter months. Nothing does more credit to the gardener than a good house of Cucumbers.—S. J. A.

ERYTHRINA CRISTA-GALLI CULTURE.

THIS, "the Coral Plant," introduced a century back, is now but seldom seen, except in the large gardens of places of some note.

For being grown well few plants are more accommodating; it may be flowered either as an early stove or late greenhouse plant, on a conservatory wall, or even in a warm open border, with a little care. It may be had in bloom early in spring by placing a plant in the stove not later than Christmas, and a succession may be kept up by starting at intervals.

In the greenhouse, if kept rather close when beginning to grow, the plants will bloom freely about midsummer; while if started in a common hotbed in March, and then gradually hardened off, they will bloom in May and June.

It is best to commence with young plants, and give liberal treatment to encourage luxuriant growth; for the stronger the growth and the finer the foliage, the stronger will be the crown of the plant, and consequently the more vigorous the supply of shoots.

In the following season the plants should have large shifts, and a free supply of liquid manure, with plenty of drainage.

The most suitable compost I have always found to consist of three parts fibrous peat, two of fibrous loam, and one part a mixture in equal quantities of leaf mould, well-rotted sheep dung, and silver sand.

A gentle bottom heat is very useful in obtaining a good supply of roots. The temperature of the house need not be more than about 60°. When the plants have made some progress let air be given to prevent the shoots being drawn up, and give them a good syringing every evening.

Erythrina is one of the finest plants I have ever grown against a conservatory wall, where it flowers beautifully. If grown in the flower garden, the best plan is to take the plants up at the end of autumn, keeping them out of the reach of frost, and nearly dry till spring.—W. GILES.

PRIMULA JAPONICA CULTURE.

THIS beautiful winter flower in most places will be making a start to do its best. Of course it can be had in flower earlier, but the blooms are wanting in colour and substance, and always appear to me to be out of season. I want my earliest in flower about the middle of November, which I manage to get near the mark by sowing on the 1st of June; and as some of them are a little behind the others, they make a succession for some time, to be followed by a later lot some two or three weeks after the first batch, which keeps up a good show until late in the spring.

When the plants in the seed pans are large enough to handle I put them singly into thumb pots in a mixture of loam, peat, well-rotted leaf mould, and a good share of silver sand. The subsequent pottings into 48's and 32's, less sand must be used, and in addition charcoal broken small. The tendency the plants have to fall sideways can be remedied by settling them down a little at each potting. My second batch are flowered in small-sized pots. Primulas with poor blooms will make a good show, but now that so many advertise their "choice strains," a poor Primula bloom ought not to be seen.

I once had the misfortune to be taken-in with some Primula

seed I paid a high price for. After incurring some trouble in growing the plants, I was rewarded with a lot of colourless flimsy rubbish, but fortunately at the same time I had a few plants from another source that were very good, so from those I determined to save my stock to prevent future disappointment, also to see how long the seed would keep and germinate. This is the seventh year I have sown and grown from my first packet of seed, and the plants for the first time came weak. I tried this to prove if the statement was correct, that the seed would not grow after the second year. I may add that new seed was sown each year, expecting every time to see the end of my first packet. Is it generally known that Primula seed will grow when so old?—M. B.

VINE CULTURE.

RENOVATING EXHAUSTED VINES.

VINES are not unfrequently injured by cropping them too heavily for a series of years. This is apparent in the weakly character of their growth and diminutive Grapes. Where the border is considered in a sufficiently good condition not to require renewing, the best treatment for Vines thus broken down is either to forego a year's crop altogether, or to crop them very lightly for a year or two.

Exhaustion of Vines from crowded training and close stopping is sometimes met with in its worst forms. As has already been referred to, the rods of Vines should never be trained closer than 3 feet apart, and the fruit-bearing spurs not closer than 16 to 18 inches. I have seen, in conjunction with close training, the fruit-bearing wood pinched at the bunch, or just one joint beyond it. This, with anything like heavy cropping, is certain in a very few years to cripple the Vines. They are in fact smothered, and worked hard into the bargain. To put fresh vigour into such Vines, cut the superfluous rods out, to give those left more room, and let the laterals grow two or three joints beyond the bunch.

The premature destruction of foliage is another fertile source of injury, whether it takes place from red spider or scorching. The evil most commonly arises from the ravages of spider. As the pulmonary arteries of the body convey the blood to the lungs, there to be exposed to the air we breathe, and undergo change, and be diffused through the system for its nourishment, so is the sap in the Vine sent up to the leaves, there to undergo change and be made fit for plant-nourishment. And injury to the lungs does not more certainly lead to debility in the animal than does the premature destruction of the foliage to the Vine or any other plant.

Early forcing, especially when the roots are in a cold ill-drained border, is most injurious to Vines; and when the principal cause of exhaustion is from a cold ill-drained soil, and where they are otherwise in such a condition that good results might be expected from them if in a more congenial border, the best way is to clear away the whole soil, disentangling and saving every root that can be saved, to make the drainage effectual, and make a new border, carefully planting the Vines again. The best time for this operation is in autumn, after the Grapes are cut, while the Vines are still in leaf and able to make fresh roots. Supposing the Vines have roots in both outside and inside borders, the one should be renewed one year and the other the next. When the operation commences, shade the roof with canvas; and after the roots are laid in the fresh soil, give a good watering at 120°, and cover up the border with dry litter to retain the heat. In 1856 I lifted a house of Vines, as thus recommended, the first week in October, only the whole instead of half the roots were lifted; and by the end of July, 1857, cut a fair crop of Grapes from them. And in December of 1858 I lifted a Vine after it had been three years planted, and planted it in anotherinery in which I had previously commenced the forcing of pot Vines, and it ripened ten good bunches in May, 1859. These instances are mentioned to show how well Vines bear being carefully transplanted or lifted.—D. TUOMSON (in the Gardener).

GARDEN LABELS.

My experience is that wooden ones are, after all, the best, cheapest, and most enduring. I have some in use now quite five years old, and showing no sign of decay; perhaps the only drawback to them is the white paint so soon gets dirty, then the name is not so legible. My plan is to paint the label well all over, except the place for the name, with two coats of white paint, and when thoroughly dry and fit for use write

the name with a heavy lead pencil well into the wood. Fix the label to the stake vertically with a nail through the middle. When the stake rots, it is easily removed with a strong pruning knife, together with the nail, ready for the fresh stake. For dwarf plants use slips of slate and white paint to write the name in.—*AMATEUR, Bexley.*

THE CHRYSANTHEMUMS AT CHELTENHAM.

As an old grower of this beautiful autumn flower, I thought I should like to see how it was done in Cheltenham, and having a jolly friend there, I journeyed thither with a few cut blooms, many of which had done duty the week before in Bristol. On Monday morning, November 23rd, I started from the Bristol terminus, first train. Cold it was—a sharp hoar frost, apparently more severe as we journeyed northward. I arrived just in time to stage my blooms and to look around. The growers are far behind the Bristolians. The plants were all of the leggy growth, which told me the Cheltenham growers had not been far a-field. The cut blooms were too true to nature, and would not bear the least dressing, a question I am not at all satisfied with. The Grapes, Apples, and Pears were very creditable.

One of the best exhibits in the Show was Mr. Cypher's Primulas—twelve plants of beautiful growth, and bloomed to perfection—just in to the day. I would recommend the Cheltenham Committee to give better prizes, both for cut blooms and plants, if they wish to see the Chrysanthemum done well. After a long tramp with my jolly friend, we at last turned in to Mr. Cypher's to have a look at his stock. There were argents at rest after a season's campaign, laying up and storing strength for another and perhaps more eventful year. I also noticed a beautiful batch of Orchids and a good house of Geraniums. Truly our friend Cypher is a wonder; that which he does and how he does it are marvellous. Ye men of Bath and Bristol, you will have to look sharp after your laurels.—*T. HOBBS, Bristol.*

ANOTHER correspondent writes:—For six large-flowered Chrysanthemums, distinct varieties, Mr. T. Smith, gardener to Mrs. Lloyd Williams, took the first prize; second prize Mr. Moorman, gardener to Dr. Abercrombie. In the collection of four distinct varieties the prizes were exactly reversed. The Pompons were remarkably good and numerous represented. For six distinct varieties Mr. T. Smith was again placed first, Mr. Weavin second, Mr. Moorman third.

The cut blooms, Primulas, Solanums, vases, and bouquets were exceedingly good. For dinner-table vases, first Mr. J. Cypher, second Mr. C. Smith, third Mr. C. Cooke; and for bouquets the prizes were exactly the same as for the vases. The fruit exhibited were remarkably good, especially the Grapes.

SOME OF THE VEGETABLE PRODUCTS OF CEYLON.—No. 3.

COTTON (Continued).

SIR JOHN BOWRING, who, from his position and love of inquiry must be considered as a most powerful witness, in his very interesting work on "Siam" thus writes:—"Let it not be supposed that I write with any feelings but those of complacency upon the 'exodus' of the Chinese from their native land, and their outpourings on all adjacent regions. I believe there is no class of settlers who, under proper control, are so likely to be useful; that the very quality—the passion for acquiring wealth, which leads them to dare all danger and difficulty, is a most valuable recommendation. Their own habits of subordination; their inborn and inbred respect for authority; their gregarious spirit, which drives them into associations of every sort, private and public, praiseworthy and pernicious, only require a thorough knowledge of their character to be turned to the best account. They already constitute nearly half the population of Siam."

An intelligent correspondent writing from China, and whose letter appeared in the *Times*, stated that on a recent visit to Shanghai he found that fifteen thousand of the better and wealthier classes had located themselves in the European colony there of their own free choice, built wide streets and extensive bazaars, pay road and police rates, and conform to municipal regulations of foreign growth with scrupulous fidelity. The same correspondent adds, "The Chinese are certainly among the most easily governed of any in the world, given two con-

ditions only—honesty of purpose and strength in the governing power. Under such conditions the latter is hardly ever called into active exercise. It is enough that it should be known to exist."

The Government of New South Wales has passed an act for encouraging the growth of Cotton in that colony, offering favourable terms to persons forming themselves into associations for growing and cultivating Cotton, and the Queensland Government has from time to time followed the same procedure.

The Cotton sent to me by the Ceylon Government to be shown at the International Exhibition in London in 1862 was valued by the representative in London of the Cotton Supply Association of Manchester as follows:—No. 1 like good strong New Orleans, worth 12d. to 13d. per pound; No. 2 like low middlings, not good Cotton, but strong, 12d. per pound.

Cotton seed is given occasionally to the cattle to eat. They like it, and it is considered fattening. In China oil is obtained from the seed of the Cotton plant, and the seeds are afterwards employed as manure, together with the branches, leaves, and pods, by being burnt, or by rotting them in pits.

SUGAR.—Very large sums have been expended in attempts to cultivate the Sugar Cane in Ceylon, but success has not been arrived at. The only estates, I believe, now under cultivation are one belonging to Lord Elphinstone and a few small estates in the southern province. There is no doubt that suitable soil exists in portions of the island to grow Sugar Cane, but it is well known that its cultivation is very exhausting to the soil, and requires heavy manuring, and this, combined with the question of labour, renders it far more profitable to grow Coffee.

Sir J. Tennant is of opinion that the mediocrity of the soil and the necessity of frequently changing the plants, coupled with a superabundance of merely watery fluid in the canes and disproportionate yield of saccharine, have hitherto contributed to discourage the extension of the enterprise. The cultivation of Sugar was first introduced into Ceylon by the Dutch.

THE PALMYRA TREE is chiefly cultivated in the Peninsula of Jaffna in the northern province of Ceylon. Mr. Fergusson in an interesting volume entitled "The Palmyra and its Products," estimates that the number of Palmyra trees in this district alone must be about seven millions, the edible product of which supplies one-fourth of the food of two hundred and twenty thousand inhabitants.

The Palmyra tree is upwards of fifteen years old before it commences to yield fruit. The sap yields for a period of four or five months at the rate of about three quarts a-day. This sap, or toddy as it is called, after it has rested and fermented, is converted into jaggery, or coarse but pure sugar, by a little lime being added to the sap, and is sold in the native bazaars at about 1d. a-pound. Three quarts of toddy will yield 1 lb. of jaggery. About 12,000 cwt. are exported annually to continental India, where it is refined. If the fruit be allowed to form instead of being crushed by the operations of the toddy-drawer, it comes to maturity in August, and there are some twelve to eighteen clusters on each flower stem, of which the tree bears about six or seven. The core of the fruit contains three hard seeds embedded in a farinaceous pulp. This pulp is extracted by pressure, and by the action of the sun is made into squares, and used for cakes or curry. The seeds or kernels of the fruit are also extracted and dried in the sun. Under the name of kelingos they are largely consumed in the bazaars of the island. The kelingos are sometimes reduced to a flour. Leaves of the trees supply roofs to native houses and fences to the fields, the old materials being converted into manure for the Rice fields. As Tennant truly states, the Palmyra tree furnishes at once shelter, furniture, food, drink, oil, and fuel for the inhabitants, with forage for their cattle and utensils for their farms. No single production of Nature, not even the Cocoa-nut itself, is capable of conferring so many blessings on mankind in the early stages of civilisation: and hence that outburst of simple gratitude in which it has been exalted by the Tamils* into an object of veneration, and celebrated in songs as a tree transplanted from Paradise.

TOBACCO.—In a late official Blue Book it is stated that upwards of fifteen thousand acres of land are under Tobacco cultivation. It is the great staple of the Jaffna district, where it is most carefully cultivated, and is largely consumed in the island. Jaffna Tobacco used to be exported to Travancore in large quantities, although, I believe, the trade has of late years fallen off. In an interesting report from the pen of a very

* The inhabitants of the northern province of Ceylon are Tamils.

able member of the Ceylon Civil Service, Mr. Sharpe, that gentleman states that in his opinion a fine field for the growth of Tobacco exists on the banks of the Walauri river in the southern province, the soil being extremely rich and fertile, and water always to be had in ample supplies from the river. In the report of the Commission appointed by the Spanish Government on the cultivation of Tobacco in the Spanish colonies, it is stated that Tobacco flourishes in rich, cool, and dry soils, and also in those of a stony or sandy nature, provided there be a foot depth of vegetable mould. Virgin forest land and meadows will produce excellent crops for many years without manures. If the soil has borne other crops previously it must have a six-months fallow, and be well manured. Whenever Ceylon has the advantage of Chinese agriculturists among the natives, aided with English capital, the introduction of superior kinds of Tobacco, such as the Cuban and Manila Tobacco, will no doubt follow.—E. RAWDON POWER, *Ceylon Civil Service (Retired), Tenby, South Wales.*

HELIOTROPIUM PERUVIANUM.

WHAT a valuable decorative plant this makes for winter, and yet how often is it neglected for novelties of inferior merit! It is a good, old-fashioned, all-year-round kind of a plant, not particularly showy, but in point of sweetness it ranks with the Violet or Mignonette, and like them it possesses an odour peculiarly its own—a distinct and grateful perfume being quite as acceptable to many as a showy flower or a plant of graceful habit. This plant is very readily propagated from cuttings put in any time during the spring months. These make sturdy little specimens in two or three months if potted-on in rich sandy compost, and potted once or twice, so as to make them bushy; a few hundred plants so grown in either large 60's or 48-sized pots come in very handy for winter-furnishing, and can be brought forward in either turf-pits or frames. If cut flowers are required, no system is better than to plant out some good-sized specimens, and train them up the pillars in a warm conservatory, greenhouse, or corridor. It is astonishing what growth and flower this plant produces when so treated, especially if in a sunny position; and if a large supply of flowers is required, the cutting necessary to obtain these will serve all the purposes of pruning. Strong established specimens frequently attain a height of from 10 to 20 feet, and flower well throughout the year. There are several newer varieties in cultivation; but for free-flowering qualities and sweetness, either for bedding or indoor work, none is superior or even equal to the old "Cherry-pie;" and I find this is also preferred by most of the growers who supply Covent Garden with thousands of this plant alone throughout the year.—F. W. B. (*in the Gardener*).

ROYAL HORTICULTURAL SOCIETY.

DECEMBER 2ND.

FRUIT COMMITTEE.—Alfred Smea, Esq., F.R.S., in the chair. Mr. Woodbridge, of Stion House Gardens sent fruit of *Musa Champa*, which received a certificate last year. It was excellent in flavour, and again received the Committee's commendation. Mr. Bennett, The Gardens, Hatfield House, sent fruit of Sutton's Improved Stion House Cucumber. Messrs. Veitch & Sons sent Veitch's Self-protecting Broccoli. The Committee admired the stock, but expressed a wish to see it at a spring meeting. A comparison was made between Messrs. Cutbush & Sons' Onion Oscar and Bedfordshire Champion or Intermediate, and after comparison it was decided, for the purpose of determining the respective characters of the varieties, that they be sown at Chiswick next year. Mr. John Robson, Bowden, Cheshire, sent Dunham Red Celery, a good variety, but not superior to Leicester Red. A very choice collection of Celeriac was exhibited from the garden of the Royal Horticultural Society at Chiswick. The e were remarkably well grown, and furnished excellent examples of the different varieties. A cultural commendation was awarded to them.

Mr. Smea's prize of £5 for the best dish of a new fruit submitted to the Committee during the year 1874, was awarded to Mr. Pearson's new Grape, Mrs. Pearson; and his prize of £5 to the best new vegetable exhibited before the Committee in 1874, was awarded to the Seville Long Pod Bean, sent by Messrs. Vilmorin, of Paris.

Mr. Veitch moved that this Committee recommend to the Council that a letter of condolence be written to the family of the late Mr. Daniel Nash, who was a member of the Committee, and expressing their appreciation of the great services he has rendered to the Society, and regret for the melancholy circumstance which deprives them of his presence.

This being the last meeting of the year the Committee as at

present constituted ceased to exist. A vote of thanks was proposed and carried unanimously to Mr. Alfred Smea for the ability and courtesy with which he had filled the office of Chairman during the past year; and a similar one to Dr. Hogg.

FLORAL COMMITTEE.—W. B. Kellock, Esq., in the chair. No certificates were granted to any of the new plants, but a plant of *Dracena Duffii*, from Messrs. E. G. Henderson & Son, was asked to be seen again; the leaves are broad, margined and occasionally broadly striped with red. A Violet of the Neapolitan type was sent by Mr. G. Brush, gardener to Lady Hume Campbell, The Gardens, High Grove, Pinner. It is named Lady Hume Campbell, but is not sufficiently distinct. *Physianthus albens variegatus*, a cool greenhouse climber, the leaves variegated with creamy white, was sent by Mr. Green, Holmesdale Road, Reigate.

The most attractive object at the meeting was a very fine group of *Cyclamens* from Mr. H. B. Smith, of Ealing Dean Nursery, Ealing. The plants were remarkably healthy, the flowers brilliant in colour and unusually large. The same exhibitor sent a dozen pots of a semi-double *Primula*.

Messrs. Standish, of Ascot, sent twelve nice dwarf plants of *Poinsettia pulcherrima*; some of them had heads of floral bracts as much across as the plants were high. A collection of perpetual-flowering Carnations from Messrs. E. G. Henderson & Son was very pretty, but no names were attached to any of the plants. To all the above collections votes of thanks were given by the Committee.

THE NOVEMBER PLUM.

I AM requested, in answer to the inquiry of Mr. Douglas regarding this Plum, to say—as Mr. Earley is precluded from answering it personally—that the name in question was given to the fruit of a solitary plant in his possession, and which he fruited for the first time last season. From all his experience, and the researches he had made, he was led to believe that no other Plum like it existed, nor had he the least knowledge that anything similar existed in the neighbourhood previously. Not deeming it necessary to question Mr. J. Douglas's assertion should the similarity be so great, he only regrets not having known of it sooner, and so have obviated giving rise to any question of precedent. Mr. Earley may refer to this subject again.—WILLIAM GREATRIX EARLEY.

DEATH OF MR. DANIEL NASH.

WITH great regret we announce the death of Mr. Daniel Nash, the head of the old house of Minier, Nash, & Nash, seedsmen in the Strand. The event happened last Saturday, after a brief illness. Mr. Nash had been ailing for some time, and those of his friends who knew him well remarked a change in him at the last Fruit Committee meeting, but this was not of such moment as to cause immediate apprehension. It was only last week that serious symptoms became apparent, and on Saturday he sank, the disease being, we understand, an affection of the heart. Mr. Nash was the father of the London seed trade, and has for nearly half a century occupied a position in which he was held in the highest respect.

THE STINGING TREE.

ONE of the torments to which the traveller is subjected in the North Australian scrubs is the Stinging Tree (*Urtica gigas*), which is very abundant, and ranges in size from a large shrub of 30 feet in height to a small plant measuring only a few inches. Its leaf is large and peculiar, from being covered with a short silvery hair, which when shaken emits a fine pungent dust, most irritating to the skin and nostrils. If touched it causes most acute pain, which is felt for months afterwards—a dull gnawing pain, accompanied by a burning sensation, particularly in the shoulder and under the arm, where small lumps often arise. Even when the sting has quite died away, the unwary bushman is forcibly reminded of his indiscretion each time the affected part is brought into contact with water.

The fruit is of a pink fleshy colour, hanging in clusters, and looks so inviting that a stranger is irresistibly tempted to pluck it, but seldom more than once; for though the Raspberry-like berries are harmless in themselves, some contact with the leaves is almost unavoidable. The blacks are said to eat the fruit, but for this I cannot vouch, though I have tasted one or two at odd times, and found them very pleasant.

The worst of this Nettle is the tendency it exhibits to shoot up wherever a clearing has been effected. In passing through the dry-tracks cut through the scrub, great caution was necessary to avoid the young plants that cropped up even in a few weeks. I have never known a case of its being fatal to human

beings; but I have seen people subjected by it to great suffering, notably a scientific gentleman, who plucked off a branch and carried it some distance as a curiosity, wondering the while what was causing the pain and numbness in his arm. Horses I have seen die in agony from the sting, the wounded parts becoming paralysed; but, strange to say, it does not seem to injure cattle, who dash through scrubs full of it without receiving any damage. This curious anomaly is well known to all bushmen.—(*Cassell's Illustrated Travels for December.*)

NOTES AND GLEANINGS.

THE first annual meeting—the maiden meeting—of THE WESTERN CHRYSANTHEMUM SOCIETY was held recently in the Devonport Town Hall, under very promising auspices, and with the most gratifying results. The Society was formed a few months since by several local gentlemen interested in horticulture, and especially in the growth of Chrysanthemums. Mr. G. H. E. Rundle was elected the President, and the fact of his consenting to take the office at once gave the movement a good start; for in connection with the Western Horticultural Society, as well as in other ways, Mr. Rundle has done as much as any single gentleman in this locality to advance the study of horticulture among the public generally, and to bring the refining and elevating influences of flowers to bear upon the masses. The Show was good. In the number of exhibitors, the number and quality of the plants, and general support accorded it, the most sanguine anticipations of the managers and promoters were realised. The Hall itself, which is one of the handsomest and most expensively decorated in the West of England, is admirably adapted for such a Show, and certainly its advantages were fully utilised in the arrangements of the stalls. The display of the Chrysanthemums was brilliant. Among those who exhibited collections of plants as well as Chrysanthemums, in order to give the Society a helping hand, were the Rev. T. Bewes; Mr. Challice, Plympton; C. Fox, Esq., Mr. Anderson, Mr. Eastley, and Mr. Cuerel, Stoke, &c.

LIVERPOOL CHRYSANTHEMUM SHOW.

THE twelfth annual Show of this Society was held Nov. 17th and 18th in the large room of St. George's Hall, than which there could not be a better place for a floral exhibition at this time of the year, particularly as it is brilliantly lighted. From the side galleries the view is splendid by gaslight; and the music from the band floating on the ear, combined with the bright hues of the flowers and the delicate tracery of the Ferns, the decorations of the Hall with its noble columns, and the moving crowd, all make up a scene worth going many miles to see. It is a pity that such a meeting should be in any way hampered for want of funds in a populous town like Liverpool, yet such is the case unless this Show has made up the loss on its predecessors, for I was told that the Committee were some £30 out of pocket. This I hope is not the case now.

Gardeners muster in strong numbers after six o'clock in the evening, when it becomes a matter of great difficulty to get to the stands of cut blooms. This year there was better competition than last, and the blooms were shown in splendid condition. I think that last year they were larger than this, but those exhibited in the present one were more equal, and showed less of the dresser's art. Last year the Show was held late, and the majority of the blooms would not have kept longer. This year I noticed several blooms that would have been better in another week; these were, however, few.

When a Chrysanthemum will cover a circle of 6 inches in diameter, and is beautifully incurved and full in the centre, we are, I think, nearly approaching perfection. In size Empress of India leads the way, closely followed by Queen of England (this I considered the finest flower in the Show considering all the stands); Hercules, Bronze Jardin des Plantes, Jardin des Plantes, Lady Harding, Nil Desperandum, John Salter, Alfred Salter, Isabella Bott, Prince Alfred, Empress of India, Guernsey Nugget. Bronze Jardin des Plantes was not so fine as last year, but the others were, I think, better.

For a stand of eighteen Mr. Norrie was first with Hercules, Alfred Salter, Nil Desperandum, Queen of England, Lord Harding, General Slade, Jardin des Plantes, John Salter, White Globe, Empress of India, Novelty, Empress Eugénie, Guernsey Nugget, Prince and Princess of Wales, Isabella Bott, White Venus, Lord Derby. Mr. G. Rhodes was second, and Mr. W. Kepps third. For twelve Mr. Rhodes was first with a splendid Empress of India, Golden Beverley, Lady Harding, John Salter, Prince Alfred, Lady Slade, Prince and Princess of Wales, Isabella Bott, Jardin des Plantes, Bronze Jardin des Plantes, Queen of England. Mr. Moreton second, and Mr. Kepps third. For

six Mr. Peers was first with Alfred Salter, Empress of India, Lady Harding, John Salter, Prince of Wales, Jardin des Plantes. Mr. Ryley second, and Mr. Johns third.

For six specimen plants, large flowering, natural habit, Mr. Morris was first, Mr. Peers second, Mr. Ingwood third. With the exception of the first prize lot the exhibits in this class were poor. For six specimen plants trained, large-flowering, Mr. Brown was first with splendid examples of Lady Talfourd, Queen of England, Mrs. G. Rundle, John Salter, Lord Derby, and Guernsey Nugget. Mr. Wilson was second with good plants, but with too little variety of colour; Mr. Ingwood third. For three specimen plants trained, large-flowering, Mr. Phythian was first with Mrs. G. Rundle, Guernsey Nugget, and Pink Perfection. Mr. Wilson second, and Mr. Ingwood third. For one large-flowering specimen Mr. Whitfield was first with Guernsey Nugget, Mr. Wilson second with Mrs. G. Rundle, and Mr. Brown third with Fingal. For one standard Mr. Phythian was first with a well-flowered specimen of Mrs. G. Rundle; the first, second, and third prizes going to Mrs. G. Rundle, which was well represented in all the different classes, and taking a place at the head of the lists for decorative purposes. Mr. Brown was second, and Mr. Ingwood third.

For six Pompons Mr. Phythian was again first with Amy, Aigle d'Or, Anrora Borealis; yellow, lilac, and white Cedo Nulli. Mr. Whitfield was second, and Mr. Wilson third. For three, Mr. Blackmore was first with the three kinds of Cedo Nulli, splendid plants and grandly flowered; Mr. Phythian second, Mr. Wilson third.

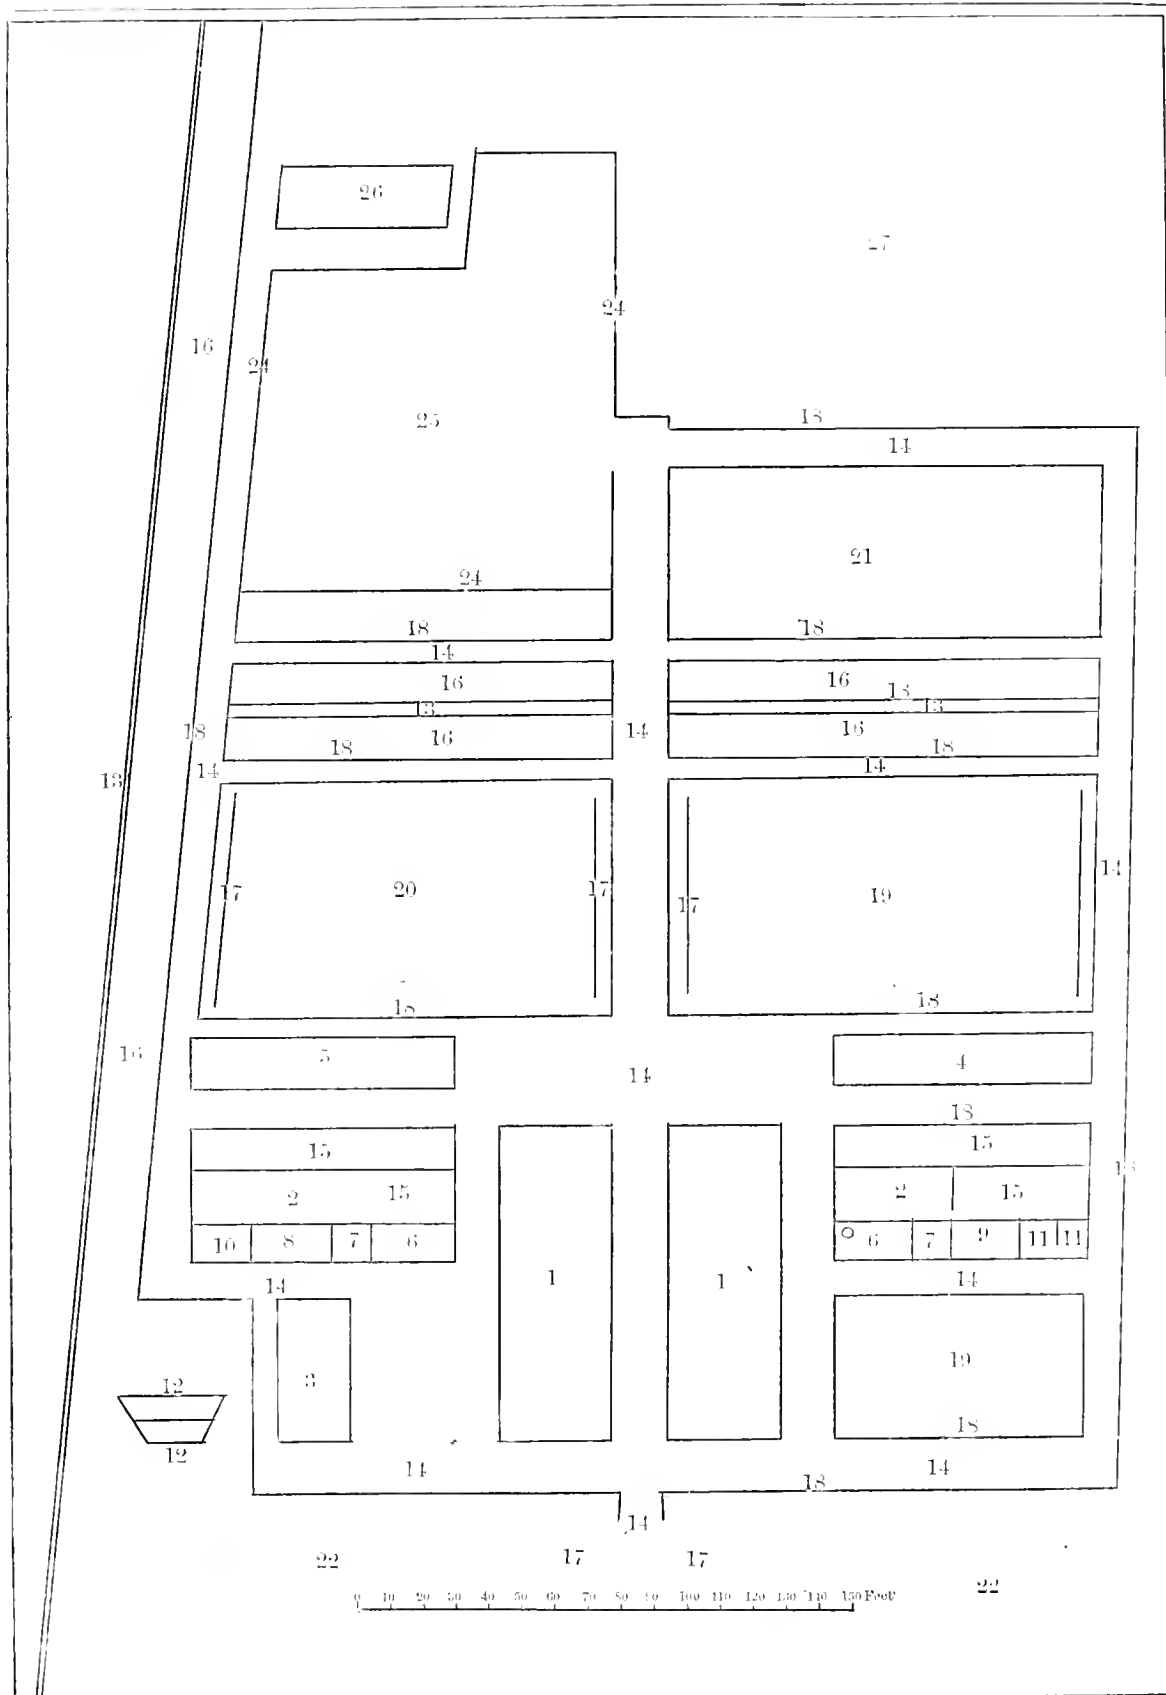

It will be seen from the foregoing that there were no trade growers competing, and the Exhibition proved that a high degree of excellence has been attained by the amateur cultivators of the Chrysanthemum around Liverpool.

Fruit was another special feature, and the competition being open to gardeners in any part of the country, splendidly-coloured Apples and Pears were shown from districts where less soot and smoke are flying about than in Lancashire. Grapes were fairly represented, as were also Pines. Mr. Jamieson, gardener to the Earl of Crawford and Balcarres, was first for three Pines with nice examples of Smooth-leaved Cayenne. Mr. James was first for Black Hamburg Grapes, net large, but beautifully coloured, and having a splendid bloom; and Mr. J. Bruce was first for Muscata. In the collections of fruit there was, I thought, too much sameness; such as two dishes of Apples, two of Pears, two of Grapes in one collection; the time of year, however, should be considered. For twelve dishes Mr. Hanagan was first, Mr. Jamieson second, Mr. Potts third. For six Mr. Hanagan was again first, Mr. Curle second, and Mr. Jamieson third.

Of Palms, Ferns, ornamental-foliaged and flowering plants there were enough to back-up the Chrysanthemums. A fine *Adiantum farleyense* was exhibited by Mr. Cromwell, gardener to T. Moss, Esq.; it was 5 feet through, but not being well supported by the rest of the six, the group consequently only stood second, Mr. Forester being first with *Cibotium regale*, *C. glaucescens*, *Goniophlebium subauriculatum*, *Microlepia* species, *Adiantum pentadactylon*, and *Lomaria gibba*. Tree Ferns, first a fine plant of *Todea arborescens* from Mr. Tyndal Bright, of Aigburth; Mr. Gore was second with *Alsophila excelsa*, and Mr. J. Anderson third. For fine-foliaged and flowering plants (10) Mr. Blomley was first, Mr. Wilson second, and Mr. Wright third. *Primulas*, *Epiphyllums*, *Mignonette*, and *Poinsettias* were not so good, not being at their best. The first-prize *Epiphyllum*, single, was by far the best of the lot.—W.

GARDENING IN SWEDEN.

OVERVAS, Sweden, the seat of James J. Dickson, Esq., is situated about half an hour's walk south from the town of Gothenburg, and is sheltered from the north by a rocky hill of considerable height. Here extensive gardens have been laid out within the last eight years under the direction and management of Mr. James Loney, son of that well-known veteran horticulturist Mr. Loney, gardener to Sir Patrick Murray Thriepland, Bart., at Fingask Castle, Perthshire. A public road divides the fruit and kitchen-garden department from the plant houses, flower garden, and pleasure grounds. In the former are two splendid orchard houses, each 100 feet long, 35 feet wide, and 18 feet high, 6 feet high at the sides. A stone path extends up the middle of the houses, and there are two cisterns on each side of the pathways for collecting rain water from the roofs. Here it may be remarked, all rain water that falls on the various roofs is collected inside in slate cisterns, from whence the overflow was conveyed to a large well, from which it was pumped for use. Since that arrangement was made, however, a supply of water has been taken from a lake to the town and passes here, giving a never-failing supply for the mansion as well as for the hot-beds and gardens, likewise for a fountain in the centre of the flower garden.

One of the orchard houses is for tender fruits, and in it two rows of standard Peaches, Nectarines, &c., planted in a made border, one on each side of the pathway, have a very fine effect on entering. The remaining space is filled up with pyramids and bushes in pots of 10 and 12 inches in diameter. Fifty miniature trees in 6-inch pots are placed at intervals round the sides and ends: all the trees look well for a good crop next season. The second orchard house is planted in the same way, but is used for Pears principally, and these show masses of fruit buds for next year. Some of the Pears in this house grown in 10 to 12-inch pots weighed as much as 1½ lb. last autumn, and Apples over 1 lb.

Late and early vineries are to the right and left of the orchard houses. Black Hamburg, Muscat of Alexandria, and Escholata Superba are principally grown for early forcing: the last-named Grape is a great favourite here. Late varieties are Lady Downe's, Alicante, Mrs. Pince, and Gros Colman. The last has not been much tried yet. The Alicante is another favourite here. The vineries are built after the newest style, which gives a long rafter or roof for training the Vine, and they have borne heavy crops for a succession of years. Two

houses are used for Pine Apples. A fruiting span-roofed one is well stocked with strong plants of Queens, Black Jamaicas, Smooth Cayenne, and a few only of Charlotte Rothschild. The other is a half-span pit for succession plants, in which are also grown, placed on the pipes, pot Vines, which are forced quickly and satisfactorily. A Strawberry pit of the same size and form as the last is principally stocked with Keen's Seedling.

On walls for Pears, Apples, Plums, and Cherries, these trees look well, and are just getting into a good bearing state. Pyramids are mostly planted as orchard trees, standards not being so much used in consequence of their being more exposed to the south-west winds, which do great mischief here, especially in autumn.

In the plant department, in connection with the mansion, is a stove on the one side and a conservatory on the other side of the main entrance, which produce a good effect, being kept as gay as possible with flowering plants from the other houses, which are a little beyond the building, and consist of a large house for specimen Camellias, Acacias, and hardwooded plants in general, which make a good show during the winter and spring months. Next come three lean-to houses all of the same size,

Fig. 141.

- 1 and 2, Conservatories span-roofed. No. 1, 20 feet high in the middle, and 15 feet at the sides; No. 2, 24 feet high, and 18 feet at the sides.
- 3, Lean-to for greenhouse plants.
- 4, Lean-to for Rose house.
- 5, Lean-to for softwooded greenhouse plants.
- 6, Span-roofed Palm house, same size as No. 2.
- 7, Boiler and coke cellar.
- 8, Plant stove.

- 9, Propagating pit, and for forcing plants in flower.
- 10, Pit for bedding plants.
- 11, Open space for plants in summer to be shaded with canvas.
- 12, Half-space for hardwooded greenhouse plants.
- 13, Potting-room and stair to cellar under Palm house.
- 14, Men's rooms.
- 15 and 16, Store rooms and tools.
- 17, Office.

the first for the smaller Camellias, Azaleas, Genistas, &c. The second is for Roses planted in borders as standards and climbers up the rafters. Third is a general house for softwooded plants, Cinerarias, Calceolarias, &c. The next is a Palm house, in which are fine specimens of *Seaforthia elegans*, *Caryota urens*, &c., the former having flowered this autumn. There are also some good specimens of Tree Ferns in this house. A plant stove is the next, in which are all the ordinary plants grown in such structures. After going from this house we come to another half-span, 18 feet high to the apex and 8 feet in front, in which are wintered a number of standard Bays in tubs, and which are placed about the grounds in summer, these and other broad-leaved evergreens being too tender for withstanding the rigours of Swedish winters. There is also a good collection of Heaths and other hardwooded plants in this house. Two pits are used for propagating, and for forcing plants into flower during the winter and the spring months; and another is for keeping bedding plants for summer decoration, of which the annually required supply is fully 25,000. The flower garden is in front of the dining-room windows, and in its centre is the fine fountain before mentioned.

The pleasure grounds have been very much extended of late, and are kept in first-class order. Broad-leaved evergreens are a great want here in winter. Conifers are, however, extensively grown and partly take their place. *Picea Nordmanniana* is quite at home; *P. amabilis*, *Abies orientalis*, *A. inverta*, *A. pyramidalis*, and many more make rapid growths. *Picea Pinsapo*, although not such a fast grower, thrives well. Many species and varieties of *Cupressus* and *Thuja*s are quite hardy. *Rhododendrons* require to be covered during the most severe cold, more especially in February and March, when the sun

begins to get strong with severe frost at night; branches of the common Spruce being used for everything that requires such protection. The shrubberies are chiefly composed of deciduous bushes, which thrive well, and, although bare-like in winter, they at other seasons become well clothed with flowers and foliage.

The accompanying are the ground plans of the Fruit department and the Plant department. The extent of the former is, however, more extensive than shown in the engraving, in consequence of the slip between the garden and boundary being omitted.

ADIANTUM FARLEYENSE.

No doubt some of your readers when visiting the Liverpool Chrysanthemum Show were struck with the magnificent specimen of *Adiantum farleyense* exhibited by Mr. Cromwell, gardener to Thomas Moss, Esq. I for one was astounded. It measured fully 6 feet through, and was one dense mass of fine

fronds, all in perfect health and beauty. *Adiantum farleyense* is the queen of Ferns without doubt, and the specimen referred to excited the admiration of all who saw it. It was evident it had been at home in the hands of Mr. Cromwell, as he must have thoroughly understood the nature of all its wants. I am sure some of your readers would be glad, like myself, of a few remarks on Mr. Cromwell's successful method of management.—W. F. R.

LARGE CEDAR OF LEBANON.

In reply to an inquiry in your Journal of November 26th, signed by Mr. G. Abbey, I recollect some twelve or fourteen years ago, when on a visit to some relations in London, to have been present at a large garden party at the residence of a Mr. Cave, who was at that time the Sheriff for the County of Middlesex. I do not recollect the name of the place, but it was within a drive of ten or twelve miles from London. I was particularly struck by the extraordinary size of a very well-grown Cedar of Lebanon, which stood in the grounds near the mansion. I paced it from the branches' extremity to the trunk, which I judged to be about 17 or 18 yards. It would, therefore, have a diameter of, say, about 35 yards, and would consequently have a circumference of more than 100 yards. I was informed that the tree had been planted there by Linnæus, which would give its age at more than 150 years, as I suppose. This may or may not be an older tree than the Cedar to which your correspondent refers; at any rate, it is the most magnificent tree of its kind that I have ever seen.—R. HAYWARD, *The Elms, West Chinnock.*

APRICOTS UNDER GLASS.

It is somewhat surprising that we do not more frequently find Apricots so protected. The only instances I have ever met with were a few pot trees in the orchard house of the amateur gardener; and judging from the experiment, there did not appear any encouragement for extension. Some few years ago we covered 100 feet of our Apricot wall with glass, and the predictions showered in from every quarter that we would find our attempt to be a failure, simply because of mere anticipation—a huge piece of nonsense. But we have succeeded year by year, having produced double the quantity in one season than during any preceding ten seasons, and fruit, too, of a much superior quality. The varieties we cultivate are not numerous, and comprise the following kinds under glass—the Moorpark, Hemskerk, Kaisha, Large Red, or what is sometimes called Gros Rouge, and the Royal. The latter does not set its fruit so freely as the former. Although somewhat shy in this respect, both in quality and size it nearly equals the Moorpark, and is of a hardier constitution. The very superior quality of the Apricot renders it at all times a welcome addition to the dessert; and more, it can be made into an excellent conserve whenever the excess is greater than the demand, while the same cannot be said of the Peach, which is more indebted to the sugar than to any inherent good quality it may possess.

The Apricot is certainly more difficult to manage than the Peach, as it is very impatient of too much heat at all times, and particularly when in flower; and in cases when ventilation is scarcely sufficient to keep down the temperature during bright sunshine, I find it very advantageous to cover the roof for a few hours with scrim cloth, or with common netting.

When the fructifying organs are subjected to an excess of heat their constitution is weakened, and they are unable to exercise their functions at the proper time, and in consequence the crop is a failure.

Before and after the flowers are opened I endeavour to keep the heat below 60°, with an abundance of air, but avoid cold draughts so far as it can be done. I have never attempted artificial impregnation, as being unnecessary under proper treatment.

Like all other kinds of drupaceous fruit, the Apricot is longer-lived in a hard limestone soil, and where this ingredient is not natural it ought to be supplied in large quantities. Lime in this instance has a very important office to perform in the formation of the stone, just as it does in the formation of bone, and as it is secreted by many invertebrated animals to form their shells. There can be no doubt, I think, that the dropping of drupaceous fruit during the stoning period is due in a great measure to a deficiency of this mineral. These minor causes may and do exercise an influence at this time,

yet they are only a secondary power.—ALEXANDER CRAMB, *Tortworth Court (in the Gardener).*

NOTES ON VILLA AND SUBURBAN GARDENING.

THERE is not a month but what brings with it some work of importance to be done in the garden, some more and some less, according to the season; but there is a maxim which should always be observed as far as possible, and that is to do everything in its proper season, because the system not only regulates the operations of gardening, and starts them well in due time, but emergencies often arise which call for immediate attention, and this system allows time to do it. December does not come in without its calls upon all those who have a garden; for, beyond the operations of protecting everything from the evil effects of severe frost, and of digging and trenching the ground, there is work which should be done before the ground is turned-up, and that is the pruning, dressing, and nailing of all trees; and after the leaf is off and this work done the vacant ground may be turned-up for the winter, and all will then look clean and tidy. In pruning allow me to say that it is best to select the hardier sorts of fruits to be done first, I mean such as Apples and Pears, as well as Raspberries, Gooseberries, and Currants. In many suburban gardens the pruning is performed very badly in more ways than one: for instance, when the wood is cut back the spurs are left much too long, and the cut is not clean, but is long and pointed, showing that it is performed by an unskilful hand. Now the same may be said of both Apple and Pear trees; that in healthy vigorous-growing trees the young wood ought to be shortened back to within a quarter of an inch of where it broke into growth, and there are generally three or more dormant eyes situated quite at the base of the shoot, which are ready to break into growth at the required time, and maintain the vigour of the tree; therefore the cut should be clean and the spur short, which answers all purposes and looks workmanlike. Again, another great fault is that when it is desired to extend the size of a tree, such as an espalier or wall tree, the young wood is often left in all at one length, regardless of its size and strength. This is not the way to have a tree well balanced in growth and bearing wood, but as a rule the weaker growth should be shortened fully two-thirds more than the strong wood; this affords the chance of the weak wood breaking into stronger growth than it did the year before, just because there are a less number of eyes to be called into action, and the strong growth will most likely break weaker because there are more eyes to support, so it will be seen that the system if practised year after year will do much towards regulating the growth of the tree and the flow of the sap. With regard to Raspberries the pruning is a small matter and very simple, for if the bearing wood of the past summer has been cut out, which it always should be after the fruit is gathered, in order to allow more freedom of growth and to add strength to the young wood for next year's use, then all there is to do now is to shorten the shoots according to their strength and ripeness, and take care not to leave too many shoots to a stock.

Gooseberries are pruned under two methods. Either the tree is allowed to carry so many shoots, which are spurred all the way up, and the extreme shoots shortened considerably; or the tree is trained so as to produce a quantity of young wood, which in the pruning time is thinned out considerably on the spur system, and the remainder left all its length in a regular manner all over the tree. I incline to, and in fact always practise, the latter plan, believing that if I do not get a greater quantity of fruit, it is at all events much finer.

There is one objection which some urge in connection with the Lancashire sorts of Gooseberries, many of which are very large—that by growing them on the young wood there is a great difficulty in rearing a tree to any ordinary size, owing to the fruit gradually breaking down towards the ground the young wood, which has to be cut off year after year. There is some truth in this, though it may be got over by staking up the trees with habits so inclined.

The Red Currant is a better-forced tree, and must be pruned on the spur system, leaving the shoots here and there where wanted at a third or half their length; but the Black Currant never does better in small gardens than when the old wood is thinned out to the very bottom, leaving new strong growth to take its place. The fruit is generally plentiful, fine, and good. As for Peach and Nectarine trees, I consider it to be the better plan to leave the pruning of them till about February, they being tender fruits; the wood is also many times late in ripening, and the severe weather of winter takes great effect upon it, but in the spring damaged parts can easily be discovered and cut out. In pruning, the wood should be thinned out considerably; cut close to the old stem, leaving no spurs as in other trees, which only die if left. The shoots that are left should be shortened the same as for other trees, but always to a wood bud if possible, because any fruit that is produced beyond the young shoot seldom comes to maturity. Some of these sorts of trees have a remarkable absence of wood buds upon them. When such is

the case the tree is going wrong, and shows a want of vigour which calls for immediate attention; and in the succeeding season such a tree ought not to be allowed to carry much fruit, with a view to encourage all the wood-growth possible; and perhaps it will be necessary to take the old soil from its roots and replace it with fresh soil of a loamy nature, but quite fresh.

Now is the best time of all the year to examine every fruit tree and see if any scale or other disease, such as American blight, is infesting them; if so, the wood should be scrubbed over with a stiff brush, and every crevice examined and cleared of the pest; then dress the tree over from bottom to top with a composition of 8 ozs. of powdered sulphur, 4 ozs. of Gishurst compound, two or three handfuls of soot, and then add enough tobacco water to make up a gallon of liquid; mix all well together, and add sufficient pure clay well worked up in it with the hand till it becomes as thick as paint, and apply it to the tree with an ordinary paint-brush, leaving not a particle of the wood untouched. I do not advise those trees to be dressed that are not infested, but the trees that are so must be done over more than once or twice, and it would be more effectual if the dressing were repeated from time to time for twelve months.—THOMAS RECORD.

LANGTON HALL,

THE SEAT OF BENNET ROTHES LANGTON, ESQ.

BEFORE narrating a recent visit to the gardens of the High Sheriff of the county of Lincoln, it can hardly fail to be interesting to dwell briefly on an outline of the history of the ancient family of Langton and their time-honoured home. The present Hall (to read history backwards), is a newly-erected mansion; it is a large handsome building of red brick with rustic stone quoins, in the Elizabethan style, built in 1866-7 by its present owner at a cost of from eight to ten thousand pounds. It is situated on an acclivity a little north-east of the village, and about half a mile due east of the site of the old moated Hall. It is sheltered on the north and east by finely timbered woods, and commands an extended view of the surrounding country, and of that particular part of which the author of "Young on Agriculture" said was by far the finest view in the county. On the extreme west of the park, on the lower land, may be traced the extensive enclosure of the old moated Hall burnt down in the reign of Henry VI. whilst occupied by Sir Thomas de Langton, but rebuilt on a site in the centre of the present village in the reign of Elizabeth, boundary lines being still discernible of it in several of the cottage homes, and the noble old Sycamore trees which graced its carriage entrance.

The family of De Langton, which was the original name, is one of the few untitled families who can date their ancestral pedigree from the time of William of Normandy in 1066, and can boast of many distinguished members since the time when the village name of Long-ton became the family surname of Langton. Foremost amongst them, in the reign of King John, was Cardinal Stephen de Langton, who was consecrated in 1206 Archbishop of Canterbury, and died in 1228; and Simon de Langton, brother of Stephen, was elected Archbishop of York in 1216, but was set aside by the Pope. Some members, too, of the family have received the distinguished honour of knighthood for their services, military and civil, rendered to their country, Thomas de Langton being knighted by Henry VI., and John de Langton by Charles II. Dr. William Langton, President of Magdalen College, Oxford, who died in 1626, was born here, and who gave the loving cup, "the Langton" of the college at this day; and Bennet Langton the great friend of Dr. Johnson and many others, whose fame as men of letters is handed down to posterity in their autographs attached to the noted "round robin." It should be added that the above-mentioned Stephen de Langton was the wise and good prelate who took a prominent part in the memorable field of Runnymede on the 19th of June, 1215. He it was who was instrumental in aiding the barons to draw up the famous document Magna Charta, and was attesting witness to the signature wrung from King John dealing the death blow to his own despotism, and securing liberty and constitutional freedom to the empire for all time to come.

We now take a bound of over six hundred years, and leave the ancestor at Runnymede in 1215 to take a glance at the home-surroundings of his descendant at Langton, near Spilsby, Lincolnshire, in 1874. The gardens of Langton are not nearly so great as the history of its family, but if not great they are good—good alike in style of formation and management. The site is excellent, and Young was not far wrong when he designated it as affording "the finest view in the county."

The mansion (*fig. 142*), is built on the south-western slope of a circular range of hills, and in the front is, as it were, a basin of some five or six miles in diameter of some of the finest land ever devoted to agriculture. It is, moreover, mostly pasture and grazing land, and interspersed as it is with trees under which the herds and flocks shelter, and skirted by an amphitheatre of hills from which the spires of half a dozen parish churches point their fingered index to the skies, we have a pastoral scene not easy to surpass. Through a break in this range of uplands are visible on a clear day the surging waves of the German ocean, distant about fourteen miles.

The grounds, like the Hall, are new—that is, they were, with the fish ponds, designed and completed under the supervision of the eminent nurserymen and landscape gardeners, Messrs. Veitch of Chelsea, who have done their work thoroughly well and in excellent taste. To better secure the privacy of the mansion, which was inconveniently near the public highway, the plan adopted was to make the lodge entrance a considerable distance away, and parallel with the road to throw up an extensive embankment. This at once effected the object, and afforded at the same time a fine site for shrubs, and secured a broad lengthy easy sweep of carriage-drive, which is one of the main ornaments of the place. This bank being composed of good soil, the shrubs have prospered surprisingly. Owing to the openness and airiness of the situation their habit is close and the colour a dense green, indicative of hardy robust health. The best kinds of Conifers were planted at intervals, interspersed with Hollies in variety, and a due proportion of flowering deciduous trees to brighten and lighten the more sombre masses, the background and intervening spaces being occupied principally by Laurels.

And now a groan, or a grumble, or a sigh of pity cannot be suppressed. I never go with a preconceived idea of lavishing indiscriminate praise on every part of a place, and never will. Mere description without a germ of instruction is not fair to the public, and flattery is not honest on the part of the narrator nor just to the proprietor of a place under notice, because it may do injury by misleading. It is pardonable of a gentleman (and how many of such there are!) who has purchased and planted shrubs, and watched with pleasure their onward progress, to dread in any way their mutilation; they would cherish and conserve every twig and leaf. It is a worthy feeling, but an immense mistake. The shrubs at Langton must suffer—no, it is not mutilation—but necessary amputation to prevent a certain deformity. The Laurels must be headed-down to permit the plants of pyramidal habit to show their distinctive features and proportions above them. To leave these coarser evergreens to unchecked growth is to produce in no long time a forest of leggy ugliness, to be levelled to the ground by some severe frost, dealing death also to better things made tender by their embraces. This common bush must be removed from that choice Cypress, which is eating away its beauty; that grossa Weigela must be routed from that charming Cryptomeria, which is being robbed of its grace and life; and so on to the end of the chapter. Mr. Rogers, the able gardener, is fully—painfully, alive to all this, and it is hoped that his kind employer will give him authority and latitude to save his choice shrubs in all their attractive features before it is too late. The Cryptomerias at this place are in beautiful health. What a fine feature it would be in this drive, with the rising bank on either hand, if the broad grass verge were taken up and round a number of these and other specimens at distant intervals, clearing away all encroachments, the only relief being the smooth velvety turf to show their elegant forms to perfection. An idea something like this carefully carried out would make something like a drive, and one which in a year or two Mr. Veitch, the planter, would glory in. There is so much ruin amongst shrubs by want of timely thinning, that a straight-home word of warning is, if not always acceptable, certainly not unseasonable. Other groups of shrubs are tastefully disposed on different parts of the lawn, and the only natural and unpreventable obstacle to their future form and well-being is the unbroken sweep of the southern and western winds to which they are exposed.

A stroll round the pleasant walks brings us suddenly on the flower garden (*fig. 143*). This is the principal feature of Langton. It is not large, but gave evidence of skill, pains, labour, and taste in bringing it to the state of perfection as seen under the burning sun of a tropical summer. Nothing but thorough culture and unremitting work could have filled the beds, even Verbenas, on that sultry aspect in the state of perfection they presented in August. I am bound in justice to say that

nothing more effective has for a long time come under my notice than this little square at Langton, shown in *fig. 143*.

Polychromatic design, (*fig. 143*), *a*, red ballast, *b*, broken slate, *c*, white sand; centre, small Golden Yew surrounded by *Alternanthera amabilis*. Body of star, *Lobelia pumila grandiflora*, outlined with *Koniga maritima*. Angles, *Alternanthera paronychioides* dotted with *Echeveria metallica*. Outer circles Golden Feather Pyrethrum. Beds 1, 1, dark *Heliotropa*, edge Golden Feather Pyrethrum. 2, 2, Lady Cullum, edge *Alternanthera*. 3, 3, Sir R. Napier Tricolor Geranium, edge *Alternanthera*. 4, 4, Crimson King Verbena, edge Golden Feather Pyrethrum. 5, 5, Silver Tricolor Geranium, edge *Lobelia pumila grandiflora*. Each bed in this design has a dwarf prominent Box edging. The panel on the whole is high-coloured, and is exceedingly rich.

In the general plan the centre bed is planted thus—the broad cross Madame Vaucher Geranium; angles, Mrs. Pollock, surrounded with *Iresine Lindeni*, the whole encircled by Golden Thyme, having an outside margin of *Echeveria secunda glauca*. Beds 1, 1, a centre plant of *Centaurea*; oval cross, Geranium Christine; angles, Blue Lobelia; margin, *Semprevivum californicum*. 2, 2, Diamond, Geranium Souvenir de Sir J. Paxton (very good pink), surrounding a mass of Verbena Purple King; edge, *Dactylis glomerata variegata*. 3, 3, Diamond, Geranium Crystal Palace Gem; angles, *Iresine Lindeni*; edge, *Lobelia pumila grandiflora*. 4, 4, centre, *Calceolaria Sparkler*, surrounded by *Calceolaria Aurea floribunda*; edge, Verbena Purple King. 5, 5, same as preceding. 6, 6, Geranium Lady C. Grosvenor; edge, Verbena Snowflake. 7, 7, Geranium Excellent; edge, Verbena Snowflake. 8, 8, Bicolor Geranium

Fig. 142.—LANGTON HALL.

Beauty of Oulton; edge, *Koniga* and *Lobelia* alternately. 3, 9, Geranium Beaton's Silver Nosegay; edge, Golden Thyme and *Lobelia* alternately. Every bed in the plan is well filled, the whole being striking and effective. The chain pattern which slopes from the main design to the walk, and is to be continued to the terrace, is planted, the circles with Geraniums in variety; the scrolls with Verbenas, purple, crimson, and white alternately.

The planting of the terrace border is, in the straight part, as follows, commencing in the centre:—The ovals, *Gnaphalium lanatum*, pinched, surrounded by *Alternanthera amabilis* (inside chain); the main chain, Golden Feather, surrounded by *Alternanthera*, in which the triangles of *Cerastium* are set. In front of this is a straight line of *Mesembryanthemum cordifolium variegatum*, margined with *Echeveria secunda glauca*. This border was perfectly filled, the outlines of varieties sharply defined, and the general effect extremely pleasing. In the circular part the diamonds were of Mrs. Pollock Geranium; ovals, *Gnaphalium*; chain, *Iresine Lindeni*; groundwork, *Lobelia pumila grandiflora*; and margin, *Mesembryanthemum cordifolium*. This gave a rich effect, yet to be looked at a long while without tiring the eye by a glare of high colours.

The charm of this attractive garden lay, perhaps, in the telling effect of the blue Lobelia. It is impossible to imagine a more smooth, dense, floriferous mass of rich blue than the variety used presented. In connection with this flower garden,

which has been so much admired by visitors, it must be added that Mr. Rogers had never seen any panel-planting, and acknowledges his indebtedness for many valuable hints leading to his success to the columns of this Journal. Its back numbers are his garden library; and turn, as he says, for what he will, he is sure to find it. He has read to a good purpose, and on his reading has brought to bear a good practical knowledge of the duties of a gardener. He has, though young, won by his ability the confidence of his employer, and speaks of him as a man should always speak of a good master, in terms of dutiful respect, and as one for whom he feels he cannot do enough.

The kitchen department is as well managed as the floral, and the fruit trees in a good bearing state. Glass is not extensive. A nice conservatory is the boundary to one side of the flower garden, filled with plants looking well; but the stove part of it is too light and airy to grow Ferns and fine-foliaged plants well, especially on the open stages, which are ill adapted to the nature of such things in a structure of the kind. A vinery in bearing carries an immense crop of Black Hamburgs. Good drainage, good support, and rich top-dressings could alone perfect such a crop as was hanging on the Vines. Another vinery is newly planted with late kinds, making very promising canes. The soil is evidently suited to Vine culture. It contains little or no lime, and has a subsoil of sand—in my humble opinion first-rate conditions for producing first-rate Grapes.

Fig 143.—FLOWER GARDEN AT LANGTON.

Longton has a nice balance of garden features, as lawns, shrubs, flowers, walks, &c. Not many great places can show better all-round gardening (making the best and the most of the means and resources) than this comparatively small place affords. It is a home and a garden enjoyed by the owner, and well it may.—J. WRIGHT.

DOINGS OF THE LAST AND PRESENT WEEKS.

VINERIES.

THE earliest house has been started, the Vines and borders having been previously prepared. There are different methods of doing this; there is a right and a wrong way. We had the management of an extensive range of vineries many years ago, and the winter treatment of the inside borders was such that near the surface no roots were to be found. The surface was forked over and left quite loose, some decayed manure being mixed up with it. At all times care was taken not to tread upon the borders in case of injury resulting therefrom; but perhaps the reason why the roots did not work into the surface soil was the method of watering by dribblers, not giving the Vines sufficient at a time to penetrate to the bottom of the prepared soil, and thirdly, allowing the border to become dusty when the Vines are at rest, which causes the small fibrous roots to perish. After cleansing the glass and woodwork in the manner previously described, and painting the Vines with the usual mixture, 3 or 4 inches of the surface soil were entirely removed, filling up the space with some rich compost. Equal parts of turfy loam and stable manure are as good as any other; this is trodden in firmly with the feet. It ought also to be stated that, before applying the surface-dressing, the border had a thorough good watering with tepid water; the dressing applied afterwards causes the heat to be retained. Some fermenting material is placed in the house, which creates a moist warm atmosphere, thereby causing the buds to break in a more regular manner than they otherwise would. Occasionally the buds do not start well when forced very early, and if they are sluggish it is not at all desirable to hurry them. Until the buds are fairly started the night temperature should not be more than from 50° to 55° in very cold nights; even if the glass falls to 45°, better this than higher. When the first leaves are formed will be the time to push them along.

Planting Vines.—Perhaps March is the best month to do this, but any time will answer during the winter months. The plants will require to have all the roots disentangled and carefully spread out. It is not necessary to cultivate a large number of varieties of Grape Vines. Black Hamburgh, Muscat of Alexandria, and Lady Downe's will be enough, and give more satisfaction than can be derived from a large number of varieties, many of which might succeed only in very favourable positions. In the late vineries we remove decaying fruit and withered leaves as soon as they are perceived. Lady Downe's requires very little attention in this respect; no other Grape keeps so well. Mrs. Pince's Black Muscat has decayed badly; the berries of this variety are very liable to mould. Gros Guillaume keeps well, but some of the berries are slightly cracked at the apex, and many of them are moulding. Where it is intended that the Grapes should keep until February and March the berries should be well thinned-out, and all the large bunches be cut first.

FRUIT ROOM.

Much care is necessary at this season to preserve the finer varieties of Pears and Apples; it is necessary to look carefully over the fruit twice a-week, and to remove that beginning to decay at once, to prevent injury to the sound fruit in contact with it. If the walls are very thick, and the roof composed of thatch, no artificial heat will be necessary unless the frost should be intense. In houses of a contrary description a fire will be necessary. A small stove may be placed in the house if there is no fireplace: of course, if this can be dispensed with, it will be quite as well. Neither Apples nor Pears are improved by artificial heat being introduced into the fruit room.

PLANT STOVE AND HOUSE FOR FORCED FLOWERS.

The greatest requisite in the winter months, for stove plants more especially, is light; the sun "just blinks a wee and sinks again," so we must take advantage of the little we do have. The evergreen climbers trained to the roof cannot entirely be dispensed with, but the wood has been unmercifully thinned-out, and the glass washed on both sides. The plants must not be unduly excited by artificial heat, but where there is but one plant stove, which contains many specimens requiring different degrees of temperature, a considerable difficulty arises. It will be found, however, that in all houses of moderate length, say over 25 feet, one end of the house is usually several degrees warmer than the other; the end nearest the boiler is warmed first, and the water must give off some of its caloric as it flows onward. In our plant stove, 28 feet by 20 feet, there is a difference of about 5°, but even this difference can be increased by covering the warmest end with some thick non-conducting

material. Orchids, such as *Phalenopsis* and even *Cattleya superba*, may be placed where they enjoy 65°; others—and the largest number of species are enumerated here—may have from 5° to 10° lower. The same with other species of stove plants. *Nepenthes Rafflesiana*, and indeed most of the species, require the highest temperature, whilst such as *N. phyllamphora* thrive best in the lower. Let this always be borne in mind, that the cause of disease in many plants, and especially Orchids, is an over-high temperature, causing undue excitement in the winter months. There is also an excellent opportunity now to clean the plants. Scale, bug, &c., may be quite eradicated by constant attention.

Forcing houses for flowers are a necessary adjunct where a continuous display has to be kept up; but it is only large establishments that have houses which can be entirely devoted to this purpose. In many large and otherwise well-arranged gardens flowering plants have to be forced in early vineries, Cucumber houses, or in any other structure where the temperature may not be exactly suited to the requirements of the subjects to be forced. It is vain to expect good results if plants are taken in either from a cold house or, as is sometimes the case, from the open ground, and placed in a high night temperature, say of 60° or 65°, all at once. The root-action does not keep pace with the top growth, and both leaves and flowers are of very weak development, and not for a moment to be compared with those that are first placed in a temperature of 45°, and the heat raised by slow gradations until it reaches the maximum. A little bottom heat is also of great service at this season. The system that gives the best results is to plunge the pots in a bed of tan or other fermenting material, not a high temperature—75° or 80° will be the best; indeed, a high temperature would do harm. We are invariably successful with *Lily of the Valley*, *Dielytra spectabilis*, and *Spiraea japonica* when a night temperature of 45° or 50° can be obtained, with a bottom heat when they are first started; a moderately moist atmosphere is also beneficial. When we have been driven to placing the plants or bulbs to be forced into a high night temperature we have placed the pots on a hotbed to promote root-action first. It is needless to urge the importance of placing the plants as near as possible to the glass; and in the case of Roses, tree Carnations, &c., watching for the first appearance of green fly, and having it destroyed by fumigating at once.

FLOWER GARDEN.

Pinks.—Who wants to know anything about Pinks? Well, they are not grown in very many aristocratic gardens; if they were, doubtless they would be appreciated as they deserve to be. We planted three beds of them: this would have been better done in October, so that the plants might have taken hold of the ground before the sharp frosts of early winter could throw them out of the ground. The beds were in the first place prepared by trenching and manuring the ground, and the plants put out in rows 1 foot apart and 9 inches between each other; and as the soil of the beds was rather wet and not in good condition for planting, a little fine dry mould was placed around the roots of each plant. All the attention the plants require during winter is to press into the ground those that have been thrown out by the frost.

Carnations and Picotees recently potted also require attention. Those plants that are not well rooted have to be protected from frost, but the lights are drawn off the frame on all favourable occasions; decaying leaves are removed from the plants at once, water being applied to the roots when necessary, but not during frosts. *Gladiolus* roots had been placed in pots on the floor of a lateinery to dry, and as soon as convenient the small bulbules will be potted in light sandy loam and leaf mould, the pots to be plunged in cocoa-nut fibre refuse in a cold frame. Removing mildewed leaves from *Calceolaria* cuttings in a cold frame behind a north wall. The weather has been so cold—cutting frosty winds from the north-east, that it was not safe to open the ventilators much. - Protected with mats all frames containing pots of half-hardy subjects.—J. DOUGLAS.

TRADE CATALOGUES RECEIVED.

Little & Ballantyne, Knockisfield Nurseries, Carlisle.—*Catalogue of Forest Trees, Ornamental Avenue and Park Trees, Deciduous and Evergreen Shrubs, &c.*

James Dickson & Sons, Newton Nurseries, and 108, Eastgate Street, Chester.—*Catalogue of Forest Trees, Shrubs, Evergreens, &c.*

Robertson & Galloway, 157, Ingram Street, Glasgow, and Helensburgh.—*Catalogue of Roses, Gladioli, and General Nursery Stock.*

TO CORRESPONDENTS.

BOOKS (Beginners).—Our "Greenhouses for the Many" and "Garden Manual" contain full information of what you require. They may be had by post if you enclose 2s. 6d. in postage stamps with your address to our office.

GRAPES (A. J.).—The Grape called *Dr. Hogg* is a new one, and is not, therefore, in the last edition of the "Fruit Manual." It is the best of the White Frontignons, having a larger bunch and berry than any of them, and a most delicious flavour. It may be grown in the same house as Black Hamburgh. The Vine has a very strong constitution, and bears well.

CUCUMBER PLANTS (J. W. B.).—Apply to the market gardeners and nurserymen near you.

CORDON PEACH TRAINING (J. E.).—The information you need would occupy pages to impart. Brichaut's "Modern Peach Pruner," which you can have from our office free by post if you enclose 3s. 8d., contains all you ask for and much in addition.

SELECT PEARS (J. E.).—The following list is in the order of merit:—*Beurre de l'Assomption*, *Souvenir du Congrès*, *Williams' Bon Chrétien*, *Thompson's*, *Doyenné du Comice*, *Glou Morcean*, *Beurre d'Amanlis*, *Doyenné Boursnois*, *Beurré Diel*, *Nouveau Poiteau*, *Vau Mais*, *Léon Leclerc*, *Beurre de Rance*.

VENTILATORS (An Amateur).—Though communicating with a shed, yet, unless that can be kept closed or opened as the greenhouse plants require, it is the safest plan to have shutters to the ventilators.

SWEET NANCY.—In Cheshire the garden Narcissus, *N. poeticus*, used always to be, and is still by cottagers, called "Sweet Nancy."—**CASTRIAN.** Another correspondent gives *N. biflorus* as well.

MEDLARS AND PEARS (L. S., Vineyard House).—Write to Messrs. Webber and Co., Central Avenue, Covent Garden Market, London.

MARCHEL NIEL ROSE PRUNING (R. S.).—You must not cut it back—*i.e.*, the growth of the current year, or it will flower very sparingly. Continue the pruning to thinning-out the long shoots—the old and bare side shoots, but the less pruning the better.

VALLOTA PERFEUA NOT FLOWERING (Idem).—We noticed that this plant did not flower so freely as usual last autumn, probably owing to the dry summer.

VINES NOT SHEDDING LEAVES (Sinclair).—The wood will be ripe now or never, and we should discontinue fire heat, keeping the house cool and dry, but applying fire heat only to exclude frost, so as to ensure the safety of the plants. We do not think you have anything to fear, the Vines having been only planted in April. The application of fire heat in September was proper, and would assist the ripening of the wood. The leaves will fall soon if you keep the house cool and dry. Do not water the border, which we presume has not been watered for some time.

VARIEGATED BEEDING GERANIUMS (W. Russell).—Prince Arthur, chrome yellow ground, black chocolate zone, gold margin; Mrs. Batters, a golden tricolor in the way of Mrs. Pollock, but more vigorous, with larger and brighter leaves; Bright Star, silver edge; Prince Silverwings, white edge, black zone; Harold, golden bronze; and May Queen, white edge.

APPLE TREES NOT LIABLE TO CANKER (Idem).—The kinds least subject to canker are more numerous than those which are liable to it, which are Ribston Pippin, Hawthornden, those being the worst we know; Orange Pippin, Keswick Codlin, Lord Suffield, and others of the Codlin type, and Nonpareil. The Pearmain is also liable to canker. Kinds not liable to canker are Gravenstein, King of the Pippins, Red Astrachan, Reinette du Canada, Dutt Mignonne, Cockle Pippin; these are dessert kinds. Kitchen kinds are Alfriston, Beauty of Kent, Bedfordshire Foundation, Blenheim Pippin, Cox's Pomona, Dumelow's Seedling, Warner's King, Mère de Monage, Norfolk Bearer, Norfolk Boeding, Bymer, Winter Majestic, and Tower of Glamis. The canker, however, is due to your soil. A good surface-manuring would do them good; in fact in such a soil fruit trees require very liberal treatment, so as to encourage their rooting near the surface.

LILY OF THE VALLEY IN POTS—BUDDED ROSES (St. Edmunds).—Leave the Lily of the Valley under the wall plunged in ashes, and with a protection of 2 or 3 inches of ashes or cocoa-nut refuse over the pots until you wish to introduce them into the greenhouse, which you may do about six weeks before they are wanted to flower. Leave the budded Roses where they are until they have grown a year, and then plant, covering the junction in the subsequent autumn with about 2 or 3 inches of soil.

HONORARY SECRETARY'S DUTY (A Constant Reader).—You cannot compel him to make out a balance sheet though he refuses to obey the decision of the Committee that he shall. For his own character's sake we think he ought to do so. The Committee could compel him to render an account of moneys received on account of the Show.

SAFFRON (H. B.).—We do not know who grows the *Crocus sativus* and prepares saffron from it. In Cambridgeshire it was grown largely. The chief supply of saffron comes to us from France and Spain. Can any of our readers inform us where it is prepared in England?

WINTER CUCUMBERS.—"Your correspondent, Mr. William Taylor, at page 463, seems to be an advocate for moderate temperatures for winter Cucumbers. I can only get good Cucumbers with a minimum temperature of 60°, and never lower than 58°, and a maximum temperature of 68°, sometimes 75°. Will 'W. T.' kindly state the varieties of Cucumbers he grows?"—**R. R. S. H.**

CHERRY (C. P.).—The nearest name to that you mention is the Marcellin, better known in England as the "Monstrous Heart."

SALE OF FRUIT, &c. (Z. N.).—It is quite impossible for us to answer your queries. Prices vary with the season and the demand. You should come up to Covent Garden Market and talk with the salesmen.

NAME OF APPLE (J. B.).—We do not know it by the name of "D'Arcy Spice." If you send us two or three we may identify it. The "Fruit Manual" is half printed.

CAMELLIAS DROPPING BUDS—CINERARIAS DYING SUDDENLY (Beginner).—The cause of the buds falling is difficult to account for when no particulars of treatment are given that are necessary for forming an opinion. The buds usually fall when the plants have not good root power. The roots may be injured by leaving the plants out late in autumn till the soil is sodden with rain, by want of water, or by a sour soil, any of which causes may produce an inactive state and often decay of the fibres, and the buds are cast because the conducting sap vessels are closed. A check to growth, as well as loss of roots, will cause the buds to drop; but we think you have sufficient cause for the buds falling in a temperature 40° to 60°. From fire heat at this season, 45° to 50° should be the maximum, and 40° the minimum for Camellias, air being given at 50°, but not to lower the temperature, and air taken off at 50°. Ours are blooming satisfactorily in such a temperature. The weak liquid manure would be beneficial, but as yours are casting their buds it will do harm. Cinerarias dying suddenly is a puzzle to plant-growers, and admits of no solution.

The plants do best when on a cool bottom and moist, so that frequent waterings are not required. Probably the plants have been pot-bound, and have then had a large shift, whereas the shifts should be frequent and small, keeping the neck or collar of the plants slightly raised to the centre of the pot, so that the water in watering drains from, instead of to, the stems of the plants.

DEEP PLANTING STANDARD ROSES (Idem).—Fifteen or eighteen inches is much too deep to plant. Plant them so that the uppermost fibres will not be more than 4 to 6 inches below the surface, manuring liberally, and mulch around with littery manure. Nothing repays liberal treatment so well as Roses.

CUTCH GRASS IN VINE BORDER (X. Y. Z.).—You may with safety, so far as the Cutch Grass is concerned, place a layer of turf, grass side downwards, at the bottom of the Vine border, upon this the drainage, covering it with 2 feet of soil not containing Cutch-Grass roots. The roots of this Grass are disposed near the surface.

DISTANCE OF STAGE FROM THE GLASS (Idem).—For a multitude of purposes the most suitable distance for the stage would be 3 feet. The plunging material you will not require if you have a stage, and of those you name neither is suitable. The leaves would be suitable for bottom heat, which would answer for the Cucumbers and Melons, and for propagating covered with cocoa-nut fibre for plunging the pots into.

NAMES OF CONIFERS (H.).—It is difficult to name these from sprays. They appear to be—No. 1, *Juniperus chinensis*; 2, *Cupressus Lawsoniana gracilis*; 3, *Thuja orientalis anra*; 4, *Thuja occidentalis compacta*; 5, *Juniperus virginiana*; 6, *Cupressus Lawsoniana stricta*.

NAMES OF FRUITS (S. M. W.).—1, Blenheim Pippin; 2, Orre's Apple; 3, Margil; 4, Golden Pearmain; 5, Golden Winter Pearmain. (*B. cum J.*)—73, 165, 31, 157, 237, 254, 26, 321, are all Vicar of Winkfield; 15, Easter Bours. Others not recognised; all but apocryphous. (*W. Hagg*)—Garden Reinette. (*E. M. M.*)—Your Pear is *Beurre Bosc*.

NAMES OF PLANTS (A. R.).—*Chrysanthemum segetum*, Corn Marigold. (*J. H. R.*)—*Tamarix gallica*, Tamarisk, one of the most graceful of shrubs, and bears exposure to sea breezes on all the south coast. It blooms in summer, in autumn and winter occasionally. (*L. E. B.*)—1, *Lolium italicum*, var. (?) 2, *Lepigonum* (*Sparganium*) *marginatum*; 3, *Helosciadium latifolium*; 4, *Hieracium umbellatum* (?); 5, *Atriplex* sp. *Speciosus* very indurated. (*Wm. H.*)—1, *Notechola tenera*; 2, *Chelanthus hirta*; 3, *Athyrium Filix-femina*. (*Wm. Bork*)—1, *Cystolepis* (*Echeveria*) *pubescens*; 2, *Mesembryanthemum spectabile*; 3, *Cotyledon* (?); 4, *Portulaca oleracea*; 5, *Mesembryanthemum*; 6, *Enaloe*, species indeterminable.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE EXHIBITION DORKING.—No. 1.

BY T. COKE BURNELL.

DORKINGS have always stood well in the estimation of the poultry-loving public, even before their fine size and comely shape were brought prominently into notice by public exhibitions. So far back as 1833 birds of this breed realised high prices, and in that year the Rev. — Boyes sold his prize pen at Hitchin for £50, and the Rev. S. Donne lost his prize birds at the Midland Counties Show, although protected by twenty guineas. Other instances of equally high prices are not wanting. In 1867 Lady Holmesdale's yard of Dorkings, which had been under the management of Mr. John Martio, realised over £100, and the prices given at this sale for individual birds would almost exceed belief. To come down to the present day, I will only instance my pen of chickens at Oxford last year, which were claimed at the catalogue price of twenty guineas, after winning Prince Leopold's cup; and my first-prize cock at the Crystal Palace Show this year sold for the same price; and I am more than ever convinced that £25 would not now be sufficient to protect a single cock, were he the best of the year and a likely stock bird.

With such a ready sale for good birds at high prices in prospect, surely a fair field for surplus energy is open to the dweller in the country. For my part I know what it is to have had to give up my profession through delicate health; and I am sure there are many like myself, who would hail with delight an occupation which gains upon one with success, and which combines with fresh air an occupied mind, a fair amount of excitement, and a good prospect of substantial profits. That the latter is no chimera I can positively state from experience; and lest anyone should be deterred by a want of knowledge, I will add that four years ago I knew as little about exhibition poultry as the most ignorant of my readers. In order that I may not be considered egotistical I will here say that the views I shall express on Dorkings are not given solely on my own authority, but only after careful study of previous works on the subject, and numerous pleasant chats with some of the most noted breeders of the day. Although Dorkings are my particular fancy, I will not ask anyone to suppose that I think them suited to every exhibitor and every situation. To anyone who has a moderate grass run and a desire for a plentiful supply of very superior chickens for the table, with a fair amount of eggs, I believe they are unrivalled, but for damp back yards and other confined spaces they are altogether unsuited.

It is often said Dorkings are only adapted to a gravelly or chalky soil; but this is a mistake, or neither Mrs. Arkwright nor Admiral Hornby would have been so successful, their poultry runs being situated on a stiff clay soil. I quote these instances in order that no amateur may be deterred, but at the same time think that anyone situated in a damp locality would be better

suited with the yellow-legged breeds, though not so well suited for the table.

As to the Dorking being tender, I can only say that last year I reared over a hundred Dorking chickens and only lost one; but this is too fortunate an average to take for any breed.

As to the economic merits of Dorkings, I have always found them fair layers of large-sized eggs; and so precocious are the pullets, that it is one of the principal difficulties of the exhibitor in this breed to keep them from laying and too early maturity.

Of the different varieties the Cuckoos are the best layers, but then they do not reach to the size of the coloured birds. For farmyard and useful purposes I prefer the Coloured and Cuckoos; while, if it is desired to combine a really useful fowl with an attractive form, I think the Whites and Silvers are unequalled.

To the would-be exhibitor Dorkings possess one very great advantage over every other breed, and an advantage, too, that cannot be lightly estimated—they are within the power of every honest fancier to prepare for show; there are no vulture hocks to pluck and curl, no hickies to pull, and no colours to dye; neither have they to be kept shut up in the dark to bring out their colours. Anyone who knows what is constantly done and exposed in some breeds will not estimate these advantages too lightly, and it is for this reason more than any other that I venture to recommend Dorking fowls to anyone wishing to become a poultry fancier.

THE CRYSTAL PALACE POULTRY SHOW.

Now that the great Show has passed I would direct attention to a matter which, in the interest of exhibitors, I think requires alteration. For two seasons past I have noticed that some of the Judges of Pigeons have also exhibited; and without attempting to impute unworthy motives to any individual, yet I think it would be far more satisfactory to all parties if the Judges had no interest whatever in the specimens on which they had to adjudicate. If one Judge shows I imagine there can be no reason to prevent the remainder; and although that exhibitor, being also a Judge, may possibly not award the prizes in the classes in which he exhibits, yet there exists the awkward fact of some of the Judges being directly interested in the classes to be judged by the others. Such cannot fail to call forth angry comments, and it seems to me ought not to be; and although the Exhibition just held is proof that at least one of the Arbitrators acted independently, and justly passed over the birds having an unnatural appearance shown by one of the others, yet this may not always be the case, and the sooner all proceedings capable of being made questionable, and of exciting the suspicions of the general body of the exhibitors are stopped, the better for all parties concerned.—F. T. WILTSHIRE, *The Manse, Lower Addiscombe.*

HAMBURGHES.

THE three varieties which I think stand pre-eminent for useful properties, as well as handsome bearing and plumage, are the Houdans, Brahmans, and Hamburgs. It was, therefore, with regret that I saw the last-named breed impeached, although wrongly, as being unsuitable for the Welsh climate. Mr. Price, Rhiwlas, Bala, has stated that Wales is too cold for these birds. If Mr. Price had qualified his assertion by limiting himself to Rhiwlas, Bala, even then his accusation would be open to criticism and doubt.

The following fact and facts are sufficient to refute Mr. Price's statement. Our esteemed Welsh judge, the ardent fancier, the veteran Hamburg breeder, Mr. J. Carr, The Hafod, Swansea, shows what he can do when, from the smoky manufacturing town of Swansea, he can send a Silver-spangled cock fit to be exhibited anywhere, and standing first on the list at the National Crystal Palace Show, bearing away the laurel from such distinguished exhibitors as Messrs. Beldon, Ashton and Booth, His Grace the Duke of Sutherland, and others.—A. T. W., *Kidwelly.*

OAKHAM POULTRY SHOW.

This was held on the 25th and 26th of November. The following are the awards:—

DORKINGS.—1, Countess of Lonsdale, Barleythorpe, Oakham. 2, C. Speed, Oakham. *hc*, C. White, Clipham, Oakham.
COCHINS.—1, C. White. 2, Miss J. A. Wingfield, Market Overton.
BRAHMA POOTRA.—1, C. Speed. 2, E. Snell, Barrowden, Stamford.
SPANISH.—1, Withheld. 2, M. Kew, Market Overton, Oakham.
HOUDANS, CREVE-CŒUR, LA FLECHE, OR ANY OTHER FRENCH FOWLS.—1, F. G. Pascall, Oakham. 2, E. Snell.
HAMBURGS.—1, E. Snell. 2, M. Kew. *c*, Rev. G. Skipworth, Oakham; W. Hughes, Oakham.
GAME.—1, Countess of Lonsdale. 2, A. Peake, Somerby, Oakham. *hc*, C. White. *c*, C. Speed.
BANTAMS.—1, Withheld. 2, E. Snell.
DUCKS.—1, Miss E. Wingfield, Market Overton. 2, Rev. G. Skipworth. *hc*, E. Snell. *c*, W. Hughes.
DORKINGS.—Coloured.—Cock—1 and Cup, J. Walker, Spring Mount, Rochdale. 2, A. Darby, Little Ness, Shrewsbury. 3, J. Watts, King's Heath. *hc*, R. Cheesman, Westwell, Ashford. *Shew's* **Pullets.**—1, A. Darby. 2, J. Watts. 3, J. Walker. *hc*, Rev. E. Barrum, Berkhamstead; J. Pollard; R. Cheesman.

DORKINGS.—Silver-Grey.—Hens or Pullets.—1, O. E. Cresswell, Early Wood, Brighthelm. 2, L. Wren, Lowestoft. *hc*, Marchioness of Exeter, Stamford.
DORKINGS.—White.—Cock.—1, W. Moritt, Gooles. 2, O. E. Cresswell. *hc*, Rev. F. Tearle, Newmarket; C. Speed; Marchioness of Exeter. *Hens or Pullets.*—1, O. E. Cresswell. 2, Rev. F. Tearle. *hc*, A. Darby; Marchioness of Exeter. *c*, C. Speed.

SPANISH.—Black.—1, T. Rogers, Walsall. 2, E. Brown, Sheffield. 3, M. Brown, Ab Ketyby. *hc*, Mrs. Allsopp, Worcester.

SPANISH.—Chickens—1 and Cup, Mrs. A. Lopp. 2, J. Boulton, Bristol. 3, H. Yardley, Birmingham. *hc*, J. F. Dixon, Colgrave, Nottingham (2); H. Wilkinson, Ebury, Skipton; E. Brown, Sheffield.

COCHINS.—Cock—1, J. Walker. 2, J. W. Crosby, West Bromwich. 3, T. M. Derry, Godley; H. Feast, Swansea; Lady G. Gordon, Orton, Longtonville, Peterborough; J. K. Fowler, Aylesbury. *c*, T. Seal, Aylesbury. *Hens or Pullets.*—1 and Cup, W. Smart, Walsall. *hc*, H. Feast. *hc*, Mrs. Williamson, Leicester; J. Walker. 2, J. W. Crosby, West Bromwich. 2, T. M. Derry; A. Darby; W. Smart; J. Watts. *c*, H. J. Ginnell, Milton; H. Yardley.

BRAHMA POOTRA.—Dark.—Cock—1, J. Watts. 2, M. Leno, Mirkyate Street, Dunstable. *hc*, Rev. J. D. Peake, Laleham, Chertsey. *c*, J. M. Wilbers, Banstead, Botesford. *Hens or Pullet*—1 and 2, R. J. D. Peake. *hc*, J. Robinson, Whitecoats, Chertsey; Rev. T. C. Peake, Hallaton, Uppingham; O. E. Cresswell; L. N. Travis, Tinsington, Cambridge; W. Hargrave, Baeap; H. Feast; J. S. Clarke, Gandle; M. Leno; J. Watts (2). *c*, L. Norris.

BRAHMA POOTRA.—Light.—Cock—1, J. Long, Bromley Common. 2, Mrs. Williamson. *hc*, C. Graves, Royston, Chertsey. *Hens.*—1, Mrs. Williamson. 2, Mrs. Peet, Sharnbrook, Bedford.

HOUDANS.—Cock and Hen or Chickens—1, R. B. Wood, Uttroter, 2, W. O. J. Derry, Newark. *hc*, G. N. Hibbert, Godley, Hyde, Manchester; W. Cutlack, jun., Littleport, Ely. *c*, H. G. Foster, Walsall.

CREVE-CŒUR.—Cock and Hen or Chickens—1 and Cup, W. Dring, Faversham. 2, G. Hibbert. *hc*, R. B. Wood; H. Feast. *hc*, R. B. Wood.

HAMBURGS.—Silver-spangled—1, J. Long. 2, H. Feast. *Silver-pencilled*—1, J. Long. 2, B. Feast.

HAMBURGS.—Gold-spangled—1 and Cup, S. W. Hallam, Whitwick, Leicester. 2, J. K. Tickner, Ipswich. *hc*, Mrs. Blakeman, Tettenhall, Wolverhampton. *c*, J. Long. *Gold-pencilled*—1, J. Long. 2, O. E. Cresswell. *hc*, J. Smith, Littleport, Ely. *hc*, W. H. Ginnell, Walsall.

HAMBURGS.—Black—1, R. S. S. Woodgate, Pembury, Tunbridge Wells. 2, J. Wilkison, Shawford, Rochdale. *hc*, W. Cutlack, jun., Littleport, Ely. *c*, H. Feast.

GAME.—Red and other Dark colours.—Cock—1, W. Adams, Ipswich. 2, H. Lotan. 3, J. Jeken, Eltham. *hc*, A. Barnett, Stamford. *c*, B. Everard, Leicester. *Hens or Pullet*—1 and Cup, E. Winwood. 2, N. Whitechurch, Melton Mowbray. 3, J. Jeken. *hc*, J. Stoppard, Wicksworth. *c*, A. Peake, Somerby, Oakham.

GAME.—White, Piles, and Light Colours.—Cock—1, W. Dabell, Farnfield, Southwell. 2, W. Adams, Ipswich. *hc*, J. Parker, jun., Markfield. *hc*, T. P. Lyon, Liverpool. *Hens or Pullet*—1 and 3, N. Whitechurch, Melton Mowbray. 2, W. Dabell. *c*, B. Everard, Leicester.

BANTAMS.—White, Clean Legs.—Cock and Hen or Pullet—1 and *hc*, Rev. F. Tearle, Newmarket. 2, B. Painter, Burley-on-the-Hill. *Black, Clean Legs.—Cock and Hen or Pullet*—1, J. Earnshaw, Hollowgate, Rotherham. 2, R. H. Ashton, Nottingham. *hc*, J. Walker. H. Draycott, Leicester. *Gold or Silver-laced.—Cock and Hen or Pullet*—1, 2, and Cup, M. Leno. *hc*, J. Walker; Mrs. Wootton, Mapperly, Nottingham; W. Stringfield, Lowestoft; H. Feast, Swansea. *Any other variety.—Cock and Hen or Pullet*—1, J. Walker. 2, Mrs. J. Longe, Ipswich. *hc*, R. S. S. Woodgate, Pembury, Tonbridge Wells.

GAME BANTAMS.—Cock—1 and Cup, W. Adams. 2 and 3, W. B. Jeffries, Ipswich. *Hens or Pullet*—1, W. B. Jeffries. 2, S. Beighton, Farnfield, Southwell. 3, A. Darby, Little Ness, Shrewsbury; J. M. Other, Newark.

POLANDS.—Cock and Hen or Pullet—1, G. W. Boothby, Louth.

ANY OTHER VARIETY—1, R. S. S. Woodgate (White Silkie). 2, M. Kew (Malays).

TURKEYS.—Cock—1 and Cup, J. Walker. 2, Mrs. H. J. Ginnell. *hc*, Rev. N. J. Ridley, Newbury; M. Kew; G. R. Pearson, Colston Bassett, Birmingham; N. Whitechurch, Melton Mowbray. *Hens*—1, H. J. Ginnell. 2, M. Kew.

TURKEYS.—Young Cock—1, E. Kendrick, jun., Lichfield. 2, J. Walker. *hc*, J. Holwell, Macclesfield; Countess of Lonsdale. *hc*, Rev. N. J. Ridley; N. Whitechurch. *c*, M. Kew. *Young Hen*—1 and 2, J. Walker. *hc*, M. Kew (2).

DUCKS.—White Aylesbury—1 and Cup, J. Walker. 2, J. K. Fowler. *hc*, T. Holton. *hc*, J. Walker; J. Hedges. *c*, H. J. Ginnell. *Rouen*—1, J. Walker. 2, J. K. Fowler. *hc*, W. Hughes, Oakham. *hc*, C. A. Crane. *East India, Mandarin, Carolina, Wild, or any other variety*—1, J. Walker (Mandarin). 2, M. Leno (Fancy). *hc*, Mrs. Stafford de Wansford; H. Yardley (Fancy); M. Leno (Fancy).

DUCKS.—White—1 and Cup, J. Watts. 2, E. Snell. *hc*, J. K. Fowler. *hc*, Mrs. Stafford de Wansford; M. Kew. *Goosings*—1, J. K. Fowler. 2, T. M. Derry. *hc*, G. H. Finch, Burley-on-the-Hill; N. Whitechurch.

GEES.—1, J. K. Fowler. 2, W. H. Crewe, Derby. *hc*, M. Kew. *Goosings*—1, J. K. Fowler. 2, W. H. Crewe. *hc*, M. Kew.

SELLING CLASS.—Cock or Cockerel.—Price not to exceed 80s.—1 and Cup, T. Rogers, Walsall. 2, T. M. Derry (Cochin). 3, H. Yardley. *hc*, L. Wren (Dorking); T. M. Derry (Dorking); S. Beighton, Farnfield, Southwell (Game); M. Kew (Malay); J. S. Clarke (3). *hc*, Cheesman; J. Watts.

SELLING CLASS.—Hens or Pullets.—Price not to exceed 80s.—1, E. Kendrick, jun. (Cochin). 2, C. Speed (Dorking). 3, J. Watts. *hc*, Rev. J. D. Peake (Brahma); H. Wilkinson; H. Yardley; E. Snell (Hamburgs); T. Rogers; J. S. Clarke.

MISCELLANEOUS SELLING CLASS.—Price not to exceed 40s.—1 and 3, W. Hughes (Turkey). 2 and *c*, M. Kew (Ducks and Turkey). *hc*, J. Walker; Rev. H. L. Wingfield, Market Overton (Rouen); T. M. Derry (Geese).

LOCAL CLASSES.

DORKINGS.—Chickens.—Cop, J. Pollard, Oakham.
CROSS-BREDS.—*Chickens*—1, Miss E. Wingfield. 2, Mrs. H. Wingfield, Market Overton. 3, C. White. *hc*, Miss E. Wingfield; Countess of Lonsdale (2).
DUCKINGS.—*Cross-bred or Common*—1, —Fisher, Ashwell, Oakham. 2, B. Painter, Burley-on-the-Hill. *hc*, R. L. Bradshaw, Egleton, Oakham; B. Painter.

PIGEONS.

TUMBLERS.—1, H. Yardley, Birmingham. 2, A. & W. H. Silvester, Sheffield.
CARRIERS.—Cock—1, E. Walker, Braunstone Gate, Leicester. 2, H. Yardley. *hc*, H. E. Walker. 3, H. Yardley. *Young Cock or Hen*—1 and 2, E. Walker. *hc*, H. A. Walker, Southam, Rugby.

POUTERS.—1 and *hc*, H. Pratt, Hampton-in-Arden, Birmingham. 2, C. H. Byford, Ipswich.

JACOBIANS.—1, S. Lawson, Preston. 2, G. Hardy, Shepherd's Bush, London. *hc*, T. W. Swallow.

FANTAILS.—1 and 2, J. F. Loversidge, Newark. *hc*, H. Yardley; J. Walker. *hc*, Newark.

TURKEYS.—1, J. Lederer, Boodle, Liverpool. 2, Withheld.

NUNS.—1, H. Yardley. 2, J. Watts, Birmingham.

TURBANS.—1, Cup, and 2, G. Hardy. *hc*, E. Snell, Barrowden, Stamford; H. Yardley; S. Lawson.

RUNTS.—1, H. Yardley.

DRAGONS.—1, G. Hardy. 2, H. Yardley.

MAGPIES.—1, G. Hardy. 2, C. G. Hinchcock, Oxford. *hc*, H. Yardley; J. Watts.

ANY OTHER VARIETY.—1, E. Walker (Barbs). 2, H. Draycott, Leicester (Barbs). *hc*, R. B. Wood, Uttroter (Florentines). *hc*, H. Yardley; A. & W. H. Silvester.

SELLING CLASS.—1 J. Watts. 2, W. Gamble, Melton Mowbray (Trumpeters).

J. H. Yardley, *hc*, E. Walker (Trumpeters); R. Kirkland, Uppingham (Dragoons.)

JUDGES.—*Poultry*: Mr. E. Hewitt, Sparkbrook, Birmingham, and R. Teebay, Fulwood, Preston. *Pigeons*: Mr. F. Esquilant, Brixton.

BIRMINGHAM POULTRY SHOW.

THE JUDGING DAY AT BIRMINGHAM.—The great poultry "Derby" has come round, or at least what used to be looked forward to as such by all the poultry-fancying world; but, unfortunately, as times change, and all the arrangements of poultry shows improve, Birmingham does not change, and, except in one or two minor points which we gratefully hail and acknowledge, Birmingham does not improve. Twenty years ago all that was thought necessary at a show was to cram so many birds into so many pens, and give them food twice a day, with little more care for their comfort; but unfortunately for exhibitors and their birds, far more is now expected at any first-class show. At the Crystal Palace, Oxford, and elsewhere we see the pens kept clean, the floors covered with grit or chaff, and green food supplied; the consequence is that the birds come home bright and healthy; but at Birmingham for nearly a week they wallow in dirt on boards, and the result all exhibitors know. This year some improvement has been made: water is hung up in proper drinking vessels, and a handful of white sand was put in each pen, which the birds rapidly dispersed. Surely the eight-shilling entry fee could provide a little road-scrappings and a cabbage leaf for every pen. So much we think it our duty to say, in the hopes that this old-established Show may, before it is too late, be prevented from falling entirely into disrepute.

The judging day is a real treat at Birmingham. One can see everything in quiet, make-up one's opinion as to which ought to be the winner (and we are not obliged to change it always when it has not been prophetic of the awards), and pick-out the bargains against the struggle at the sales' office on Monday morning. The ten-shilling entrance fee is well spent, and we advise all fanciers to spend it next year, not omitting to put on great coats, for a more draughty place than the Poultry Hall it is impossible to conceive.

Brahmas now head the book. Why? Perhaps because they are more likely to brave well the cold of the upper end of the building than Dorkings; or, perhaps, their admirers will tell us because they have been found a more generally useful breed. They number five hundred pens. We are glad to see several new winners, and not merely the Palace champions with all their places transposed. The Selling classes must be a boon to the Judges in eliminating much rubbish from the superior classes, but we wish the price might be extended to £5 a pen, for rows of Dark hens with hideously light and speckly breasts testify to the fact that decent breeding birds cannot be bought for 30s. each.

Dorkings show a falling-off; there are not two hundred pens in all. We miss the immense classes of Coloured cockerels and pullets there used to be, and their quality too. Silver-Greys (barring the old cocks) are good, and so are Whites.

In *Cochins* the competition is very great. We never remember having seen such a high average in Whites as in the hen and pullet classes. Their awards were not out when we left late in the day.

Malays muster very strong, and after them the *French*, *Spanish*, and *Hamburgh* classes are all of their ordinary size and merit. When we come to *Polish*, Silvers seem going up both in numbers and merit. There are several pairs of hens of extraordinary beauty, their immense tufts still asymmetrical. Alas for the beautiful White-crested Blacks! they are becoming few, and their looks betray in-breeding and degeneracy. The Variety class contains nothing very remarkable. We saw a pen of Black *Cochins* with more than ordinary lustre; a pen of Padua *Chamois* of poor washy colour. It is a sad pity that no one takes up the more rare *Polands*. Selling classes for varieties other than *Brahmas*, *Dorkings*, and *Cochins* are a failure. White *Bantams* actually muster but one pen short of their Black cousins.

Rouen *Ducks* and *Turkeys* are a marked feature of Birmingham. *Turkeys* especially are well seen in the Cattle Hall, and are in ample pens, where they look happy and less cramped than in the ordinary zinc pens. There are four classes for them, and eighty entries—a grand opportunity for purchasers who want to improve their stocks. *Turkeys* seem scarcely to have a fancy value, and many grand birds are for sale at little over market prices.

THE *PIGEONS*, as usual, are in the gallery; the classes small but excellent. On the first day the *Pigeons* fare well, for the temperature in the gallery is warm and even; on the later days the heat in former years has been intolerable, and the poor birds have suffered much.

At intervals throughout the day the awards, as far as made, are posted up on a card, and this year on an improved plan: the number of every pen noticed being given in order, with its distinction. Such were our impressions of the judging day—too

short by far at this time of the year, and in Birmingham, to "do" the Show, but long enough to give a pleasant glance at the whole thing, and to make us wish that our birds had not five more days to endure in Bingley Hall.

[Such were the notes made before the awards were announced, and then our reporters combined and wrote in addition:—]

BIRMINGHAM, venerable Birmingham, the mother of poultry shows, now holds her annual gathering; the same old faces met again on Saturday last at Bingley Hall—the same old faces were to be seen at the "Acorn" in the evening. Birmingham, with a few exceptions, remains the same; she has adopted a few of the "Selling Classes" that have proved so successful at her fashionable daughter's entertainment at the Crystal Palace, and we find a little larger supply of silver plate in the schedule; in other respects the Birmingham of 1874 is the Birmingham of 1861. We are pleased to record the fact—Birmingham is respected for her antiquity. The old supporters who have visited and exhibited since she has held a show would be sorry to see any great innovation; and fanciers, who may be tempted to pay another Birmingham a visit, would hardly care to see the same birds exhibited in the same manner, and probably in the same position in the prize list as at the Crystal Palace. But here we have a change—the hens and pullets are shown in pairs: this makes a greater strain upon the resources of a poultry yard than the exhibition of a single hen or pullet, and consistently a greater impression is made upon the mind of the fancier with regard to the general quality of the exhibitor's stud.

The entries of *Pigeons* are 116 less than those of last year, but this is more than made-up by the increase in the number of entries in the poultry classes. We append a comparative statement of the entries in the several varieties for seven years:—

	1868	1869	1870	1871	1872	1873	1874
Brahma Pootra.....	233	233	261	340	384	444	501

BRAHMAS have this year superseded the *Dorkings* in their place of prominence in the catalogue. The *Dark cocks* we thought a good class, but many of the best birds were not in condition. Pen 20 (Ansdell), a grand bird, secured the first prize. Pen 15 (Percival) was second, but we liked the third-prize (*Lacy*) better. He was a splendid cock, good in shape, size, and colour. Pen 14 (Lingwood), fourth, was rather up in the tail, otherwise he would doubtless have obtained a better position. Pen 27 (Cotterell) and pen 14 (Bennett), very highly commended, well deserved the distinction; the latter was beautiful in colour, a good shape, but rather small. Pen 6, highly commended, we liked, but he was not over his mount. Pen 21, highly commended, had some good properties, but he was out of condition.

The *Cockerel* class was a large one, and contained some fine specimens. Pen 107 was awarded the first prize, the winner of the twenty-guinea cup at the Crystal Palace being placed second. In some respects we liked the winner; he was a good-framed bird, had a small comb, but it was peculiar, being narrow and spiky. He had not what we should call quite a mottled breast, as the old style of *Brahma* cocks had, but a peculiarly-marked breast; some of the feathers we should describe as pencilled, and others as aplashed. The second-prize bird was not in such good condition as at the Palace. The fourth and fifth birds we liked, and they deserved their position. Pen 57 (Miss Pennant), very highly commended, will make a good bird; pen 99 (same owner), very highly commended, pretty, but small; pen 58 (Smith), very highly commended, had a bad comb, was very leggy, and we thought not worthy of the distinction; pen 64 we were also at a loss to know why it was very highly commended; pen 45 (Gwydyr), highly commended, was pretty, but had a little white in fluff; pen 80 (Lingwood), unnoticed, we thought in some respects the best bird in the class.

Hens.—Pen 132 (Ansdell) was first. It contained two fine birds, but not quite a match; one was very fine in colour and markings, the other we thought a little inclined to be mossy. As a pair we liked the second-prize pen (Crabtree); they were very large and well matched, but in markings not quite equal to one of the birds in the first-prize pen, but both superior to the other. Pen 122 (Lingwood), third; both birds were more distinctly marked than the two first pens, but not so large or good in leg-feathering. Pen 139 (Wright), fourth, very large, good in shape, with a good ground colour, but not so well pencilled as the first three.

Pullets.—With the exception of the two first pens we thought them a poor lot. Pen 208 (Leno) were first; they were beautifully marked, sound in colour, rather small, but decidedly deserved their position. Pen 190 were also well pencilled, but small; pen 205, third (Watts), were well matched; pens 184 and 185, fourth and fifth, were poorly pencilled; pen 169, highly commended, contained one good pullet; pen 195, highly commended, we preferred to fourth and fifth; pen 166, unnoticed, also contained a pair we thought equal to fourth and fifth.

Light Brahmas.—The old cock class was a very poor one. Pen 341 (Turner), first, was a small bird, good in colour; condition, we consider, placed him in his position. Pen 230 (Webb) was more like a Houdan in colour than a Brahma; we could not understand why he was placed second. Third (Worthington), fourth (Cotterell), were good in colour; the latter had an ugly comb. Many good birds were out of condition or not over their moult, otherwise, we feel sure, some of the winners in this class would not have obtained their honours.

Cockerels.—Here Mr. Lingwood secured both first and second prizes with two well-grown nice birds with good points. 226 (Haines), third, was a large bird, but getting very yellow. 253 (Haeeler), fourth, was small, white in tail, poor in markings, with only a good ground colour to recommend him; he was entered at £3 3s., by no means a bargain. 262 (Williamson), fifth, small, but better than fourth. Very highly commended and highly commended were conspicuous by their absence in this class. Pen 280 (Bird) we considered deserved notice.

Hens.—305 (Williamson), first, beautiful in colour, and shown well. 315 (Cotterell), almost as good, but not in the condition of the first. 301 (Percival), third, contained one good hen; the other we thought had a yellow tinge. 304 (Turner), highly commended, as a pair we liked as well.

Pullets.—318 (Williamson), first, a nice pair. 367 (Haines), second, large, but not so clear in markings as the first. 341 (Mitchell), one good pullet, the other narrow and rather yellow. 348 (Leno), fourth, as a pair we thought them better than third. Pen 362 (Thorn), fifth, nicely matched, well marked, but small. 345 (Watte) we fancied deserved some notice from the Judge.

DORKINGS.—Taking the Dorkings as a whole they were not equal either in numbers or quality to those lately exhibited at the Crystal Palace, neither did they show to such advantage in the wooden pens, which we are sorry to say were not kept very clean.

Mrs. Arkwright took the cup for old cocks with a very large bird and good in feet, but indifferent in comb and very light in colour. Second, a grand bird, which lately took the cup at Oakham. Third, Mr. Darby's Rose-comb, very large, with grand feet and legs. Fourth, a good Dark bird, but in shocking condition, his comb having quite fallen over. Pen 505 (Burnell) was not the first Palace bird, which we hear has changed hands at twenty guineas.

Coloured cockerels were a good class. First, very good in comb and feet, but hardly dark enough in colour; second, a neat bird with good comb; third, very young, and will make a fine cock; fourth, very white in breast; fifth, a very good bird, and well placed. Pen 541 (Mrs. Arkwright) was an extraordinarily good bird, and was most unaccountably left out. Pen 516 (Arkwright), large and bony, but dark in foot, and with curved big toes; pen 528 (Hamilton) was fourth-prize at the Palace; pen 536 (Kell) a very good bird; pen 548 (White), a wonderfully broad bird with good feet, but spoilt by his comb. Pen 515 (Drewry), 520 (Kell), 534 (Lingwood), 535 (Baker), 538 (Cresswell), 539 (Denison), 544 (Hemson), were also good.

In Dorking hens there six or seven very good pens. First, a very large and good pair; second, very nice and in capital condition; third, very large, but not over dark in colour. Pen 558 (Bartrum) contained one grand hen, but badly mated; pen 551 (Arkwright) very good; pen 553 (Drewry), cheap at £3 3s.; 566 (Darby), a good pair, and will look much better when their combs are out; 544 (Mozer), good; 560 (Harvey), large, but out of condition. On the whole this was a very good class.

The Rev. E. Bartrum's first and second-prize *pullets* were good birds in fine condition; third, very dark, one a particularly fine bird; fourth, neat, but not large; fifth, a good pen. Mrs. Arkwright's *pullets* were not shown in very fine condition. Pen 580 (Denison), dark and good; 581 (Capple), large and good in shape; pen 576 (Pilkington), good in shape and style.

Old Silver-Gray cocks were a poor class. The first well placed, but a little too dark in hackle; second, rather small, with lopping comb. Pen 588 (Robinson) was white on the thighs, but otherwise a good bird; 589 (Rutledge), good but for white in tail.

In Silver-Gray *cockerels* Mr. Cresswell repeated his Palace victory with a splendid bird; second and third good birds, and well placed. Pen 592 (Watts), smart; 593 (Burnell), very perfect; 594 should have been in the Coloured class; 597 (Newton), large and perfect.

Silver-Gray *hens* and *pullets* were particularly good classes. We liked Mr. Cresswell's unnoticed pen quite as well as his first-prize hens. 609 (Denison), a nice pen, as also 608 (Raines). The cup Silver-Gray *pullets* were pretty birds, but rather pale

in colour and sooty in feet. One of the second-prize *pullets* had a toe nail too many. Third very good in colour, but not large. Pen 610 (Rutledge) were very good, and might well have had a prize.

White Dorkings still keep too yellow. The cup cock was a nice bird, but white in earlobe and minus part of one toe; second, large but yellow. Pen 622 (Fairhurst), good; 624, a grand old bird.

The first-prize *White cockerel* had a good comb, and was nice in colour, but had one spur badly outside. Second, indifferent in comb, and not particularly good in shape. Pen 630 (Hayne) looked as if his foot had had a bad knock, as the latter was quite blue in colour and too tender to stand upon; 631 (Cresswell) had no peak to his comb, otherwise good; 632 (Oliver), good in colour, comb, feet, and shape; 634 (Fairhurst), good colour, but bad comb.

White hens were a small class. First were large square-built birds well ahead; second pen not equal in size. Pen 642 large; 645 (Darby), very good.

The first-prize *White pullets* were very perfect, and the best pair out for some time; the second were good enough to run them closely.

The Dorking Selling classes were a failure. The first cock had lost one toe, but was otherwise good. 662 (Richardson) would have been very good only for his spurs. The first in the hen class were a fair pair of Dark *pullets*.

COCHINS.—Here a great increase has taken place in the number of entries, and they now form almost a show in themselves—317 entries. Buff and Whites were very good, especially the latter. The Partridge we thought poor; and we were very sorry to see the Blacks, which formed such very large classes at the Crystal Palace, omitted entirely from the schedule. It was a mistake: we know of no birds whose progress is watched with greater interest.

Old Buff *cocks* were a fine lot. Here the positions of the first and second-prize Crystal Palace pens were transposed. Mr. Burnell's bird was certainly not quite in such good condition as at the Palace, but he is so superior in almost every essential that we were sorry to see him deposed. Third (Lady Gwydyr), was a good bird. Fourth (Tindal), we think the winner of first prize here last year as a cockerel, has grown a fine bird, a little coarse in comb, and has moulted rather mealy on the wing. 693, fifth (Burnell), good in colour, like almost all Mr. Burnell's birds, but rather ugly in comb.

Cockerels.—First, pen 748 (Lady Gwydyr), contained a huge chicken of immense proportions, that will when fully developed make a grand bird. It was the easiest win in the Show, notwithstanding some excellent birds were to be found in the class. Pen 711 (Percival), the Oxford winner, was second. Pen 724 (Tomlinson), third-prize, splendid in colour but small. 738 (Wiggin), fourth-prize, rather dark in tail, but a good bird. 705 (Lady Gwydyr), fifth, a small lemon-coloured bird. Pen 723, highly commended, belonging to the same exhibitor, we liked much better. Pen 727, highly commended, was pretty but small. Pen 722, highly commended, good in colour, but slightly hooked. Pen 736, highly commended, had some good properties. Pen 746 highly commended (Tomlinson), was a fine bird, magnificent in colour, but showed some white in the earlobe; this must have been the only thing that kept him out of the prize list. Pen 725, highly commended, we did not like; he had more the carriage of a Fantail Pigeon than a Cochin. Next pen, 726, unnoticed, we liked much better. Pen 735 we also thought deserved some notice.

Hens.—Pen 723 (Taylor), first a fine pair well matched; we think we remember them as first and second at Palace. Pen 767 (Procter), second, good. 771 (Cattell), fourth; one hen had an ugly comb, otherwise they would have changed position with the third. 762 (Cattell), fifth, we did not like; one hen was poorly feathered, the other we thought vulturized. 765 (Tomlinson), highly commended, we thought deserved a better position.

Pullets.—817 First (Lady Gwydyr), a charming pair, sound in colour, well matched, good in feather, and worthy of their position. 808 (Crabtree), second; also a nice pair. 798 (Procter), third; tolerably good, but badly matched. With so many fine pens behind them, we think this should have kept them out of the prize list. 782 (Lady Gwydyr), fourth; good. 784 (Taylor), fifth; one pullet had a bad comb, the other we fancied inclined to vulture hocks, but they had some admirable properties. Pen 776, highly commended, a nice pair, but one pullet had a nasty twist in the hackle. 779, highly commended, small but pretty. 780, highly commended, contained one good pullet; had the other been equal to her they would have been among the winners. Pen 812, highly commended, both good birds, but not a match; they were the best pen out of the prize list. Pen 783, highly commended; Pen 811, highly commended; and 806, highly commended, entered at £2 2s., well deserved the distinction. Pen 802, commended, we thought merited highly commended. Pen 803, unnoticed, were a well-matched pair, sound in colour, with several good points; one pullet we fancied

had a little twist in the hackle. 809, commended, should have been entered in the Bantam class.

Partridge.—In old cocks, 830, first (Lacey), a grand bird; 811, second (Taylor), a fine bird, but a little inclined to vulture hocks; 838, third (Tudman), a good bird, a little brown in fluff. 840, highly commended (Lacey), sound in colour throughout; we fancied him better than third. 812 (Stretch), unnoticed, we believe was the first at the Palace.

Cockerels.—851 (Tindal), first, we thought he had very suspicious-looking hocks, but he was a fine bird, and with this exception deserved his position; 858 second (Jones), beautiful in colour, but we did not like his comb; 816 third (Tindal), was also a good-coloured bird, but wanted leg-feathering. 852, highly commended, we thought a pretty chicken. 818, highly commended, did not like his tail. 847 we thought deserved some notice.

Hens.—The winning pen, 867 (Tudman), were fine birds, well pencilled, with good leg-feathering; 868, second (Stretch), big birds, but not so clearly pencilled; 865, third (Taylor), contained one good hen.

The *pullets* we considered a very poor class. Pen 880 (Stretch), first-prize, we thought should have been shown in the class for hens. Pen 879, second (Percival), well grown, but deficient in pencilling. Pen 876, third, good-shaped, with plenty of leg-feathering, but like the second in pencilling. Pen 872, highly commended, well pencilled but small. Pen 835, highly commended, were beautifully marked, but very young; we considered them better than the second and third. 886, highly commended, we should also have placed in the prize list.

Whites.—Pen 899, first (Percival), was a beautiful bird, rather inclined to go yellow. 901, second (Burnell), we did not like; pen 894 (Talbot) we should have placed before him; he was better in comb, and a bigger bird. 903, third (Procter), should then have retained his position, as we preferred him to the second. Pen 905, commended, was a beautiful bird.

Cockerel.—Pen 907 (Burnell) was first, but we liked pen 909 (Williamson) third, better; he had a thorough Cochinchina-shape, and we considered him in almost every respect superior to the first. Pen 917, second, we did not admire, and thought a better might have been found.

Hens.—934, first were a splendid pair, shown in magnificent trim; 932, second, the legs of one of the hens were in bad condition, and very deficient of leg-feathering. 930, third, good pair, well shown. 931, highly commended, deserved a prize. 942, highly commended, we thought contained a hen and a pullet.

Pullets.—956, first were a superb pair; 951, second; 946, third, well deserved their positions: so many good pairs were to be found in this class that the Judge must have had great trouble in making his selection. Pens 953, 954, 942, and 939 struck us as being about the best of the highly commended birds.

MALAYS put in a creditable appearance: they are thought worthy of four classes at Birmingham, and so many chickens come out. The first cock is a grand bird, marvellously strong in limb; second, good, but with a strange-looking hind claw; Mr. Brooke's highly commended bird is the richest in colour in the class. The cup cockerel is a noble bird in carriage and mien, conspicuous for his clean and brilliant orange legs; second, smaller but stylish; a good White, highly commended, but as usual with White Malays, tinged on the wing. In hens the first winner is a veritable cinnamon in colour: second, somewhat darker. There is a Black hen in this class, but unfortunately of no merit. Mr. Sabin's cup pullet is a gem in colour and shape; one of his highly commended birds is also good.

CREVE CŒURS progress in merit, but decidedly not in number; the old and young birds are mixed together, which is not fair to the latter. The first cock deserves his position; he is a superb bird in superb condition, deep-bodied, and lustrous in colour. It seems to be a merit in Crèves that they moult out well; second is also grand in shape and colour, not remarkable for tuft; third, a large bird in frame, with a beautifully round tuft. 1058 (Wood) struck us as being an enormous bird, though deficient in breast.

Hens are a good class, the cup-winners gigantic birds; one of them has too much white on the tuft. Second very good too, but not so full-breasted as some other birds in the class; third are very black in tuft for old birds, and have handsome beards. Mr. Crabtree's pen are as fine as any in the class, but white in their tufts and scaliness on the legs of one must have thrown them out. Mr. Cutlack's pen are well shown, and deserve their high commendation.

HOUDANS are divided into four classes, and good they all are. The first cock is a tall bird, a thorough French Houdan in look, his only blemish being some rudimentary feathers on his legs; the second is well-marked and large, but his tuft poor, and feathers appear on his legs too. We should have put Mr. Quibell's highly commended bird higher; he is rather light in colour, but sprightly for his age, and massive.

The cup cockerel is a typical bird in every point, with noble carriage, full breast, and perfect feet; second, good all round,

save an inclination to knock-knees. 1103 (Dring), a most promising cockerel. The first-prize pen in the class for hens contains one magnificent bird; the colour of both is beautiful for adult birds, and their feet white and good. The second are as large, but a little too light.

The first *pullets* are very large, but too dark in plumage and feet, and one with a poor tuft; the second less, but a beautiful match, and perfection in colour. 1127 (Copplestone), good.

POLISH.—We regret to see all the varieties of this breed so much in the hands of one or two exhibitors. All four prizes for White-crested Blacks go deservedly to Mr. Shaw; his first-prize cock is lovely in colour and in shape of crest. Mr. Unsworth's bird has a very large though not very shapely crest. The first-prize Golden cock rightly wins from the immense size of his tuft and his robust appearance. He is evidently an old bird and somewhat too light in tail. Second, a handsome bird, but not so rich in breast-colouring as the first, and with a smaller crest.

SPANISH.—The class for old cocks was a small one—nine entries. Pen 1138, first, has the largest lobe, but he was very coarse and ugly in comb. Pen 1140, second (Beldon), the Palace winner, we liked much better; he was not so big in the lobe but the white was of much better quality, and he had a good comb for an old bird. Pen 1144, third, was another coarse bird; we liked pen 1142, highly commended, better.

The *Cockerel* class mustered twenty-six entries. Pen 1167, first-prize (Miss Brown), was a good selection: this bird was second at the Palace, the first-prize Palace bird we could not find. Pen 1165, second, was a coarse bird. Pen 1172, third, was much worse, he had a short lobe, and one side was longer than the other. Pen 1160, fourth (Jones), was a neat bird, with a face of good quality: we should have placed him second, with pens 1152 and 1150 for third and fourth. Pen 1163, unnoticed, was a superior bird, but out of condition.

In the *Hens* some fine birds were to be found, those in the best condition winning, several good pens being passed over through not being forward enough.

Pullets were not a good class. The first-prize pen, 1182, had nice faces, the others will improve as they get older. We thought all the awards correct.

In consequence of pressure of time we are compelled to postpone our report of some of the classes until next week.

PIGEONS.

From whatever cause it may arise, one thing is certain—the Pigeon Show at Birmingham is losing its prestige, the entries this year in point of numbers scarcely coming-up to a good provincial show. The prizes are good, and the classification extended, and yet the birds do not come. Why is it? Is it because the birds in most classes are shown in pairs? or is it the wretched little pens in which the majority are exhibited? We know not; but the fact remains that in some classes where first and second prizes of £2 and £1 are offered two entries appear, while three and four are several times met with. We regret this state of things, because we remember the time when a high commendation was thought as much of at Birmingham as a prize at many other shows.

Carriers.—Black cocks (old) were a good lot, though few; but we thought one eye of the first-prize taker gone a little too far; second, a good sound bird.

Black Hens.—First, a splendid bird.

Dun Cocks.—First, a good-wattled bird, rather paler in colour than we like.

Dun Hens.—First, a good bird with good box beak; others rightly placed.

Carriers, Any other colour (two entries).—Very bad Blues, but good birds in other respects.

Black Carriers hatched in 1874.—Some grand young birds were shown in this class. The best Carriers did not take the prizes, and a question arises which it would be well to ventilate and settle if possible—viz., Is a bird which has a patch of white on the vent and belly, and a fringe of the same colour at the knee-joint, a black bird? We do not express an opinion at present, but hope to have the views of some of our eminent breeders on the subject.

Young Carriers, Any other colour.—First, a grand pair of birds; second, we cannot express an opinion on, as only one bird was in the pen at the time of our visit.

Pouters, Red or Yellow cocks.—First, good colour, with large crop, but a coarse heavy bird, not our notion of an elegant Pouter; a good Yellow highly commended.

Red or Yellow Hens.—First, a good Red; second, a poor Yellow.

Blue Cocks.—First, a magnificent bird; third, a good raking bird; second, we did not like.

Blue Hens.—We preferred second to first.

White cocks were a good class, but we should have placed Mrs. Ladd's second first. In hens again we thought Mrs. Ladd's elegant bird entitled to first honours.

Almond Tamblers were a fair class, and we considered the prizes rightly placed, but should like to see a little more head

properties. The feather in first and second-prizes was good, but skulls not large.

In Short-faced Tumblers, Other colour, we thought the first coarse, and preferred the second Reds.

Long-muffed and other Flying Tumblers were pretty and interesting classes. Birds of almost every feather were shown. These birds are great favourites with Birmingham fanciers.

In *Balds* Mr. Woodhouse was first with a pair of neat birds well cut.

In *Beards*, first and cup went to a fair pair of Blacks, which were recently picked-out at Stevens's sale for a few shillings; Mr. South second with a really nice pair of birds.

Barbs (old birds), except first-prize, were not a grand lot. The same may be said of those bred in 1874, except cock in first prize, which is a good bird.

Trumpeters.—Fulton first and second with Blacks; Mr. Shaw third with a very promising pair of young Whites.

Runts.—Mr. Green unapproachable.

Fantails, White.—A good class, but in the wretchedly small pens in which they were shown we could not attempt to pick-out the best, and do not envy the Judge his task.

Archangels.—Mr. Wilkinson took the prizes with two pairs of good birds.

Nuns require handling before expressing an opinion thereon.

Swallows were, as is usual at Birmingham, a good class.

In *Jacobins*, Red or Yellow, First and cup went to a grand pair of Reds; second, Yellow, cock good, but a poor hen.

Jacobins, Any other colour.—First, very fair Blacks.

Turbits, Red or Yellow.—First-prize Reds wanting colour; Cresswell's highly-commended Yellows rather large, but good.

Turbits, Other colour.—Mr. South first with very neat Blues; second, Blacks, not good colour.

Owls, Foreign.—Mr. Sparrow first and very highly commended with good, strong, healthy-looking birds.

Owls, English.—We liked Mr. Shaw's second Silvers although very young. Mr. Buns sent two pairs of good birds, which were too late for competition.

Dragoons (as in catalogue).—Blues were a very good class, and we considered the prizes rightly placed, most of the winners, although judged by a Birmingham Judge, being of the so-called London type.

Reds or Yellows also very good, Mr. Graham still holding his own.

In Silvers we liked the first-prize birds very much; also Mr. Tegetmeier's highly-commended birds, which we would have placed higher in the list.

Whites were a good class.

Antwerps, Silver Duns.—A grand lot, most of the birds of a well-marked type, but we should have placed the second birds first.

In the Red Chequers Mr. Gamon was first, second, and third with grand birds. We fancied we recognised an old acquaintance in the cock in the second pen. Some beautifully-marked birds were shown in Blue Chequers.

In the class for Homing birds we considered most of them too stout, and too much like Short-faced Antwerps. Mr. Sparrow's second-prize pen were a good lot.

The other new or distinct variety class is always strong at Birmingham. First, a moderate pair of Pire Pigeons; next first, good plain Ice; two seconds to Satinets and Turbeteens; thirds, Whiskered Owls and Frillbacks, with many other pretty and interesting birds.

BRAMA POOTRA (Dark).—Cocks.—Cup, T. F. Ansell, Cowley Mount, St. Helens. 2, R. P. Percival, Northenden, Manchester. 3, H. Lacy, Hebbden Bridge. 4, Horace Lingwood, Creeting Needham Market. *vhs*, F. BANTAMS (Selling Class).—1 and 2, G. Hall. 3, A. Ashley. *c*, M. Leno.

DOCKAS (White Aylesbury).—*Cup* and 4, J. Walker. 2 and 3, J. K. Fowler. *hc*, Mrs. A. Tindal. A. Robertson, Kilmarnock; J. K. Fowler.

DOCKAS (Golden).—*Cup* and 4, R. Gladstone, jun. 2, A. Woods. 3, J. Walker. 4, T. Wakelind. *hc*, J. K. Fowler; R. Gladstone, jun.; A. Woods, Sefton, Liverpool (2); Rev. E. J. Howman, Nuncaton; T. Statter, Manchester (4); S. Shaw, Stainland, Halifax (2); J. Walker; W. Meanley, Haudsworth, Birmingham; W. Stephens, Gloucester; W. B. Eches, Whitechurch, Salop.

DOCKAS OR ORNAMENTAL WATERFOWL (Black East Indian).—1 and 3, G. S. Sainsbury, Devizes. 2 and 4, J. W. Kelleway, Isle of Wight. *hc*, G. S. Sainsbury (2); J. W. Kelleway; S. Burn; W. B. Eches; J. M. Kilvert, Wem, Salop.

DOCKAS (Black).—*Cup*, J. Walker. 2, M. Leno. *hc*, H. Yardley.

DOCKAS (Carolina).—1, M. Leno. 2, C. H. Mayo. *hc*, R. Wilkinson, Guildford, Surrey; Mrs. Arkwright, Sutton Scarsdale, Chesterfield; S. Burn, Whitby; H. Yardley.

DOCKAS (Call).—1, R. Gladstone, jun. 2, Mrs. H. J. Bailey, Rosedale, Tenbury. *c*, A. H. Jones, Lark Hill, Liverpool.

DOCKAS OR ORNAMENTAL WATERFOWL (Any other variety).—1, M. Leno. 2, H. Yardley. *hc*, K. R. Fowler; C. H. Mayo, Dorchester (2); R. Wilkinson; M. Leno (3).

DOCKAS (Any variety).—1, S. Burn, Whitby. 2, P. Unsworth, Loxton, Newton-le-Willows. 3, J. K. Fowler. *hc*, Rev. C. B. Rowland, Clifton Vicarage, Warwick; W. Tyler, Birmingham (2); E. Shaw, Plas Wilnot, Oswestry; E. Kendrick, jun. (2); W. B. Eches; W. Stephens, Highnam Green, Gloucester; A. Woods, Sefton, Liverpool (2); J. Walker; C. L. Boyce, Birmingham; C. H. Mayo (3).

GEESSE (White).—*Cup*, J. Walker. 2, R. R. Fowler. 3, Lord Sudeley, Tuddington, Wiltshire. *hc*, Lady G. Vernon, Droitwich; Lord Sudeley.

GEESSE (Grey and Mottled).—1, R. R. Fowler. 2, J. Walker. 3, T. Watson, Whiteacre, Coleshill. *hc*, Mrs. Thornhill, Thetford; Miss L. King, Geashill, King's county, Ireland; E. Shaw (2); A. Woods; Mrs. H. J. Bailey, Rosedale, Tenbury; W. Lort.

TURKEYS.—*Cocks*.—*Cup*, Rev. N. J. Ridley. 2, J. Walker. 3, W. Wykes, Wolvey, Hinckley. *hc*, Mrs. J. Nutt, Fillingale, Coventry; E. Arnold, Whittlesford; R. Lythall, Offchurch, Leamington; Mrs. Lawrence, Chesterfield; Mrs. H. J. Bailey; W. B. Eches.

TURKEYS.—*Young Cocks*.—1 and 3, E. Kendrick, jun. 2, W. Wykes. *hc*, T. Watson; E. Kendrick, jun.; J. Nutt; Lady G. Vernon. 4, W. Wykes (2); F. Lythall (3); W. Wykes; Rev. N. J. Ridley; Mrs. Lawrence; J. Walker.

TURKEYS.—*Hens*.—*Cup*, E. Arnold. 2, Rev. N. J. Ridley. 3, E. Kendrick, jun. *hc*, F. Lythall (2); W. Wykes; T. Watson.

TURKEYS.—*Young Hens*.—1, W. Wykes. 2, J. Walker. 3, E. Arnold. *hc*, F. Lythall; E. Kendrick, jun.; Mrs. Winterton; Mrs. Lawrence; J. Walker; W. Wykes.

PIGEONS.

CARRIERS (Black).—*Cocks*.—1, R. Fulton, New Cross, London. 2, H. Yardley, Birmingham.

CARRIERS (Black).—*Hens*.—*Cup*, R. Fulton. 2, H. Yardley. *hc*, W. Siddons, sen., Acton, Birmingham.

CARRIERS (Dun).—*Cocks*.—1 and 2, R. Fulton.

CARRIERS (Dun).—*Hens*.—1 and 2, R. Fulton. *hc*, W. Siddons, sen.

CARRIERS (Any other colour).—1, W. Siddons, sen. 2, H. Yardley.

CARRIERS (Black).—*Young*.—1, F. Smith, Birmingham. 2, H. M. Maynard, Ryelands, Isle of Wight. *hc*, R. Fulton.

CARRIERS (Any other colour).—*Young*.—*Cup*, H. Heritage, Mortlake. 2, R. Fulton.

POUTERS (Red or Yellow).—*Cocks*.—1 and *hc*, R. Fulton (2). 2, H. Pratt, Birmingham.

POUTERS (Red or Yellow).—*Hens*.—*Cup*, F. Gresham. 2, H. Pratt.

POUTERS (Blue).—*Cocks*.—*Cup* and 2, H. Pratt. *hc*, W. W. Watkin; R. Fulton; E. Beckwith, Sunderland.

POUTERS (Blue).—*Hens*.—1 and 2, F. Gresham. *hc*, E. Beckwith; W. Harvey, Sheffield.

POUTERS (White).—*Cocks*.—1, W. W. Watkin. 2, Mrs. Ladd, Calne. *hc*, H. Pratt; Mrs. Ladd.

POUTERS (White).—*Hens*.—1, R. Fulton. 2, Mrs. Ladd. *hc*, W. W. Watkin.

POUTERS (Any other colour).—*Cocks*.—1, H. Pratt. 2, F. Gresham. *Hens*.—1, R. Fulton. 2, E. Beckwith.

TUMBLERS (Alderton).—*Cup* and 2, R. Fulton. *hc*, H. Yardley; J. Ford, London.

TUMBLERS (Short-faced).—1, R. Fulton. 2, E. Beckwith. *hc*, J. Watts.

TUMBLERS (Long-muffed).—1, W. B. Mapplebeck, jun., Masey, Birmingham. 2, J. Watts. *phc*, F. Smith, Birmingham. *hc*, W. B. Mapplebeck, jun.; F. Smith; W. Todd, Erdington, Birmingham (2); C. E. Chavasse, Birmingham; E. D. Careless, Birmingham. *c*, W. B. Mapplebeck, jun.; F. Smith.

TUMBLERS (Any other variety).—1, W. Ellis. 2, W. B. Mapplebeck, jun. *hc*, J. Ford; J. Watts.

BALDS.—1, W. W. Woodhouse. 2, G. Smith.

BALDS.—1 and *Cup*, J. Ford. 2, G. Smith. *phc* and *hc*, W. Woodhouse.

BARDS.—*Cup*, H. M. Maynard. 2 and 3, R. Fulton. *hc*, F. Smith.

BARDS.—*Young*.—1, H. Yardley. 2, H. Heritage. *hc*, F. Smith.

TRUMPETERS.—1 and 2, R. Fulton. 3, S. Shaw.

RUNTS.—1 and 2, T. D. Green, Saffron Walden. *hc*, A. A. Vander Meersch.

TOOTING.—*Cup*, H. Yardley.

FANTAILS (White).—*Cup* and *c*, Rev. W. Serjeantson, Shrewsbury (2). 2, H. M. Maynard. 3, J. E. Loveridge. *hc*, Rev. W. Serjeantson; E. Beckwith.

FANTAILS (Any other colour).—1, 2, and 3, H. Yardley.

ARCHANGELS.—1 and 2, R. Wilkinson, Guildford.

NUVS.—1, H. Yardley. 2, A. A. Vander Meersch.

SWALLOWS.—*Cup*, H. Yardley. 2, W. Todd. *hc*, W. Harvey.

MADES.—1, W. Todd. 2, H. Yardley. *phc*, J. Watts. *hc*, W. Harvey, Sheffield.

JACOBS (Red or Yellow).—*Cup*, W. Woodhouse. 2, A. A. Vander Meersch. *hc*, R. Fulton (2). *c*, G. Smith.

JACOBS (Any other colour).—1, R. Fulton. 2 and *hc*, A. A. Vander Meersch. *c*, S. Shaw, Stainland.

TURBOTS (Red or Yellow).—1, S. Shaw. 2, W. Todd. *hc*, O. E. Cresswell. *c*, H. Yardley.

TERRITS (Any other colour).—1, G. South. 2, R. Filton. *the*, H. Yardley.
OWLS (Foreign).—1 and *the*, J. J. Sparrow, London. 2 and *hc*, F. Braund, Bideford.
OWLS (English).—1, J. Watts. 2, S. Shaw. *hc*, W. Tedd. *c*, R. Filton.
DRAGONS (Blue).—Cup, R. Woods, Mansfield. 2 and 3, W. Gamon, Chester.
the, C. E. Chavasse. *hc*, J. Watts; G. South, London; H. Yardley; W. H. Mitchell, Moseley, Birmingham (2); R. Woods; F. Graham, Birkenhead; W. Gamon. *c*, W. Ellis, Idle, Leeds; R. Woods.
DRAGONS (Red or Yellow).—1 and 2, F. Graham. 3, G. South. *the*, R. Woods. *hc*, R. Woods; F. Graham (2). *c*, R. Woods; G. South.
DRAGONS (Silver).—1, G. South. 2, W. Gamon. 3, W. Bishop, Dorchester. *hc*, H. Yardley; F. Graham; W. Gamon; W. B. Tegetmeier, Finchley, London; W. Bishop. *c*, H. Ya. dley.
DRAGONS (Any other colour).—1, W. B. Mapplebeck, jun. 2, W. Bishop. 3, *hc*, and *c*, F. Graham.
ANTWERPS (Silver Dun).—1, C. F. Copeman, Birmingham. 2, W. Gamon. 3, H. Yardley. *hc*, W. Slater; W. Gamon (2); W. Vao Ward, Birmingham.
ANTWERPS (Blue).—1, W. Gamon. 2, H. Yardley. 3, J. W. Ludlow. *hc*, W. Vao Ward; W. Slater.
ANTWERPS (Red Chequered).—1, 2, and 3, W. Gamon. *c*, W. Ellis; W. Slater.
ANTWERPS (Blue Chequered).—1, W. Gamon. 2 and 3, J. W. Ludlow. *hc*, W. Gamon; H. Yardley.
ANTWERPS (Homing).—Cup and 3, W. Ellis. 2, J. J. Sparrow. *hc*, H. Yardley; W. Ellis (2); J. J. Sparrow. *c*, W. B. Tegetmeier.
ANY OTHER VARIETY.—1, J. W. Ludlow; W. Harvey. 2, H. Yardley; J. W. Ludlow. 3, W. B. Mapplebeck, jun.; H. Yardley. *hc*, R. Filton; J. W. Ludlow. *c*, W. B. Mapplebeck, jun.; H. Yardley (2); J. W. Ludlow.

JUDGES.—*Poultry*: Mr. J. Bailey, Mount Street, Grosvenor Square, London, Classes 11 to 24, 39 to 52, 69 to 71. Mr. J. Dixon, North Park, Clayton, Bradford, Classes 53 to 63, 98, 99, 105 to 111. Mr. E. Hewitt, Eden Cottage, Sparkbrook, Birmingham, Classes 25 to 38, 88 to 91, 100 to 104. Mr. W. R. Lane, New Street, Birmingham, Classes 76 to 79, 93 to 97. Mr. E. Lowe, Comberford, Tamworth, Classes 80 to 87. Mr. J. H. Smith, Skelton Grange, York, Classes 72 to 75, 92. Mr. R. Teebay, Fulwood, Preston, Classes 1 to 10. *Pigeons*: Mr. H. Child, Brunswick Road, Sparkbrook, Birmingham, Classes 129, 149 to 157. Mr. F. Esquilant, 4, Effra Road, Brixton, London, Classes 112 to 128, 130 to 135. Mr. Harrison Weir, 9, Lyndhurst Road, Peckham, London, Classes 136 to 148, 158.

CHIPPENHAM POULTRY SHOW.

"Sometimes there are clouds of gloom,
 But these are transient all.
 If the shower will make the Roses bloom,
 Oh, why lament its fall?"

BUT as on Thursday, November 26th, 1874, after the week's frosts, incessant rain for a month will not make the roses bloom again this year, one must confess we did lament its fall, especially as it fell and brought with it snow, and sleet, and mist. It was not in the pleasantest of tempers that we entered the Poultry Show, and we did not find much there to raise the spirits. Some of the birds were very good, but the arrangements were wretched. When we left late in the afternoon there was not a catalogue ready, though we walked to the printers ourselves and tried to obtain one; and as for the pens, the least said of them the better—mere empty boxes, tea-chest-looking affairs, with wire nailed on the fronts. Surely next year the Committee will send to Southampton and see what Mr. Billett can do for them. The greater part of the birds, too, were in a very cold place, and looked at times quite miserable, but then the day was most depressing, and being a small Show we must not be too critical. We hope, however, next year to find some improvements. Mr. Hodson judged, and his awards gave great satisfaction. We feel sure he must have had some difficulty, for some of the pens were in perfectly inaccessible dark corners, and the pens did not go on smoothly, but up and down three tiers, and so some birds in a class were on the dark floor, and others in a high position and good light.

Dorkings came first. The first and second were two good pens of coloured birds in fine condition, and certainly above the average quality; third highly commended (Pope), a large pen of Whites, but cock loose in comb and bad colour in wings; 7 (Orledge), a fair pullet. *Spanish* made up quite a smart class. The first-prize pen had a beautiful old cock and a hen with a capital face. The second-prize pen was a good pair also, as were Mrs. Bartrum's two pens 10 and 11. *Game* had two classes; the Reds were the best, the winning pens being two smart pens, and nicely shown. 17 (Stagg), a good hen of fine shape. *Cochins* were fourteen pens. The first prize went to old Whites, the hen rather small and with a shade of colour on her breast. The cock was the bird third at the Palace; he is good in colour, but has a poor comb and seems weak in the legs. The third went to nice Partridge chickens. 37 (Pearson) had a large lemon cock, but a poor hen. 41 (Holmes), a good-shaped White hen, but poor in comb, and the cockerel with her yellow. *Brahmas* were in one class, and they mustered thirty-one pens. The first went to a nice showy pen of Lights, which had the good luck to be in a high pen and in good light. The third went to fair Darks. 53 (Seammell), a nice-shaped Light cockerel with a bad comb. 75, Highly commended (Maggs), a nice pen. We were really much pleased with the *Hamburgs*, one seldom sees so good a lot at the southern agricultural shows. In Spangled the first were very good in comb and lobe, and a bargain at catalogue price of £2 2s. Second also good and cheap. 90 (Orledge) a good cockerel. In the Pencilled, 91 (Carr), the first-prize cockerel was

a very good bird, and won well; second also a nice pen of Golds. *Polands* only had three pens, but we think the first was almost the best pen in the Show of any breed. They were very beautiful Silvers, the cock with a wonderfully fine crest, and the hen well marked. Second very poor White-crested Blacks. *Game Bantams* were only middling, Black Reds first and Duckwings second; we liked the latter pen best, they were of the best colour. 109 (Wingfield & Andrews), a very fair pen. In the Variety Bantam class Gold-laced won first, a rather nicely marked pair. Second Blacks, a little coarse. 110 (Law), a nice pair of White Frizzled. The Variety class was a large one, but principally a poor lot. The first went to an exceedingly fine pair of Malays in very good feather; the second to a nice pair of Crêves, though the hen was rather brown in crest. 126 (Fry), a very fair pair of Andalusians, the cockerel with a good comb, and his shape very good. In the *Cross-breeds* a large pair of Brahma Dorkings were first. They were nearly thorough Brahmas, and seemed a large and useful pair of birds.

Turkeys and *Geese* were very good; the first-prize pen of the latter went to a pair of Mottled, very fine and heavy.

Rouen Ducks did not seem a grand lot, the first-prize pen easily ahead. The winning *Aylesburies* were large and good, but their pens were so small they did not show to advantage. In the Variety Duck class Blacks won the prizes. We liked the Duck in the first-prize pen very much, and we admired the drake in 177 (Stagg). The second pen was not so good as two or three of the highly commended ones, they were so very large, though good in colour and head.

In the Game-cock sweepstakes there were only two pens, both Mr. Stagg's, so he won back for his prizes his own entry fees, minus 1s. per pen, and gained in addition the additional bounty of £1 given by the Society. We furnish a complete list of awards below.

DORKINGS.—1, 2, and *hc*, J. Pope, Corsley, Warmminster. *c*, J. Orledge, Chippenham.
SPANISH.—1, J. R. Rodbard, Writington. 2, Mrs. Tonkin, Bristol. *hc*, Mrs. J. K. Bartrum, Chippenham (2).
GAME.—*Black-breasted and other Reds*.—1 and *hc*, W. H. Stagg, Netheravon. 2, E. F. Woodman, Cirencester. 3, J. Dimmock, Bowood. *Any other variety*.—1 and *hc*, F. Bailey, Calne. 2, G. Hanks, Malmesbury.
COCHINS.—1, J. Turner, West Hayes, Bath. 2, Hon. Mrs. Sugden, Wells, Somerset. *hc*, Rev. C. R. J. Pearson, Buckland, Durham; Mrs. Tonkin; Mrs. J. T. Holmes, Bath. *c*, Hon. Mrs. Sugden; Miss J. Milward, Newton St. Loe; H. Haddrell, Calne.
BRAHMAS.—1, Mrs. J. T. Holmes. 2, H. Haddrell. *hc*, J. S. Maggs, Tethury. *c*, W. E. Smith, Bath; J. R. Rodbard; H. Haddrell.
HAMBURG.—1, *Gold or Silver-spangled*.—1, C. Topp. 2, T. Reeves, jun., Bratton. *hc*, H. H. Thompson, Colehill; J. Orledge. *Gold or Silver-pencilled*.—1, J. Carr, Swaensea. 2, J. Ackerman, Witney, Oxon. *hc*, T. Reeves, jun. *c*, J. Orledge.
POLANDS.—1, J. Hinton, Warmminster. 2, Hon. Mrs. Sugden.
BANTAMS.—*Game*.—1, E. C. Phillips, Brecon. 2, G. S. Sainsbury, Devizes. *hc*, G. Hanks; Wingfield & Andrews, Worcester. *Any other variety*.—1, R. W. Martin, Bath. 2, B. F. Parrott, Henbury. *hc*, Rev. K. V. Law, Christian Malford, *c*, Rev. R. V. Law; B. F. Parrott; J. S. Maggs.
ANY OTHER DISTINCT BREED.—1, J. Hinton, Warmminster. 2, J. H. Ward, Garsage, Dorset. *hc*, C. G. Moule, Melksham; J. C. Fry, Marchfield; R. W. Martin. *c*, J. Pope; M. H. Sturt, Pewsey.
CROSS BREEDS.—1, J. S. Maggs. 2, A. Gregory, Chippenham.
TURKEYS.—1, Miss J. Milward. 2, N. M. Brown, Langley Fitzurse. *hc*, I. Smith, Chippenham. *c*, R. Spackman, Broughton Gifford.
GESE.—1, A. Spackman. 2 and *c*, G. Hanks.
AYLESBURY.—1, J. S. Maggs. 2, G. Hanks. *Any other variety*.—1, J. S. Sainsbury. 2, G. Hanks. *hc*, G. Hanks; H. Brown, Moulton, Swindon.
SWEEPSTAKES FOR GAME COCK.—1 and 2, W. H. Stagg, Netheravon.
JUDGE.—Rev. F. G. Hodson.

DUMFRIES AND MAXWELLTOWN POULTRY SHOW.

BY far the largest and best Show ever held at Dumfries came off on November 27th and 28th, and not alone were the entries large, but the quality showed a marked progress upon all previous Shows. The Mechanics' Hall is a building well adapted for the purpose; and while it is far from prepossessing outwardly, the interior is handsomely decorated, and on this occasion ornamented with foliage plants. The pens in which the poultry were shown were of wood with wire fronts, the only fault being that they were rather small for the large varieties, and the examination of these was consequently rather difficult.

First on the list were the *Dorkings* (mostly Silver-Greys), and we can congratulate the owners upon the possession of some capital birds in both old and young, the colour, size, and style being in all respects correct. *Spanish* were a moderate lot, with the exception of the winners; but these were good in both young and old, the latter winning the medal. *Cochins* any age were first and second old, and third young, all good in colour except the second, the cockerel. In young some of the best birds were badly matched, Cinnamon cocks being mated to Buff pullets in some cases, but the winners were well matched and good in colour. *Brahmas* in both sections were grand, Dark winning first, second, and medal, and a nice pen of Light ones third, the medal pen being uncommonly good in shape and foot-feathering. The young birds were a large class and mostly noticed, the first, a neat and perfect pen, were not the largest; second large, but scarcely so forward; the third-prize cockerel looked older and more worn, but the pullet was most exquisitely pen-

cilled. In Red Game the first were a pen of Black Reds, not as stylish as some, but very sound and hard in flesh and feather; second and third Brown Reds, the first old and second young, good in all particulars, but scarcely of the fashionable shade of colour. Duckwings and Piles were rather irregularly shown, many of the hens not good in colour; the first, Duckwings, very neat, but young and small; second also of that variety, larger, but not equal in colour; third very sound Piles, rather short of colour.

With the exception of the winners the *Hamburghs* were not good; the Gold-spangled, excepting the first two, being especially poor. The first in Silver-spangled were a good sturdy pen, and well worthy their position. As a class the Gold-pencilled were by far the best, the medal for the section being awarded here to a perfect pen of chickens, the Silver-pencilled running these very closely, but the rest in this class were but poor. A class was provided for *Houdans*, and this was well filled, and most of the birds were very good, the winners of high quality, the first-prize cock and second-prize hen being two of the best crested birds we have ever seen. *Scottish Greys* were not good, for although these were generally well marked, yet the cocks were mostly white in tail. Silver *Polands* were first in the Variety class, and Gold second, the third being a nest pen of *Crêves*. The Selling class was large, and many birds changed hands; eighteen pens of these were noticed. *Aylesbury Ducks* were good, but Rouens even better; every pen of the latter was noticed. In *Sebright Bantams* the winners were all Golden, and of fair quality. Black were pretty good as a class, the first-and-medal pen one of the best we have seen of late, small, neat, perfect in comb, and extremely well furnished; second a neat pen, but large; and third good, but not in full feather. Whites were very poor. In Red Game Bantams the first were a capital pen of old birds; second Brown Reds; and third also Black Reds, the latter failing in colour, but very good in style. In the next class Duckwings and Piles were the winners, the first grand, but looking a little sickly.

PIGEONS.—There were nine classes, *Pouters* being first on the list. This class was not good, but a really good pen of Whites was first. In *Carriers*, the first were Duns of great merit; the second Blacks, younger, but grand in style and carriage; the third, also Blacks, were rather broad in skull. *Fantails* were very good, many of these being very good in carriage and motion, with good tails, and most of these were noticed in the list. In *Tumblers*, Short-faced, the first and second were Almonds, and third Black with splashed necks. In common Tumblers, of which there were twenty-two entries, there were some capital birds; the first a perfect pair of Blue Balts, second a nice pair of Yellow Mottles, and third Blue Beards. *Barbs* were pretty good, Duns taking the first position, Blacks the second, and Yellows the third. The first-prize Red *Jacobins* were very good in all points, but none of the rest were of more than ordinary merit. In the Variety class a very good pair of Mottle Trumpeters were awarded first, the second being Black Trumpeters, and third Yellow Turbits.

It is long since we saw a show better managed than this, the Secretary, Mr. Maxwell, with a capital Committee, looking well to the comfort of the birds. There was a large and good show of *Canaries* and other cage birds, most of which were of the Scotch Fancy varieties.

DORKINGS.—Medal, J. Cunningham, Tarbrooch, Castle Douglas. 2 and *W. G. F. Lyon*, Kirkcubbin, Dumfries. 3, W. F. H. Arundell, Dumfries. *hc*, R. Reid, Holbaird, Canobie (2). *Chickens*.—1 and 2, J. Cunningham. 3, R. Reid. *hc*, Capt. A. P. C. Maxwell, Terregles; G. F. Lyon; W. F. H. Arundell. *c*, Capt. A. P. C. Maxwell; G. F. Lyon.

SPANISH.—Medal, Wallace, Anchenbrin, Manchline. 2, W. Martin, Stranraer. 3 and *hc*, J. Pool, Milnfeld, Annan. *Chickens*.—1, M. A. Wither, Stranraer. 2, W. Wallace. 3, W. Martin. *hc*, Miss H. Robinson, Wigton; J. Pool, Milnfeld, Annan.

COCHIN-CHINA.—Medal, W. Martin. 2 and 3, G. F. Lyon, Dumfries. 3, T. Kennedy, Dumfries. *hc*, R. Reid. *Chickens*.—1, R. Maxwell, Dumfries. 2 and 3, G. F. Lyon. *hc*, Capt. A. P. C. Maxwell; T. Kennedy; W. Martin.

BRAHMA POOTRAS.—Medal and 2, R. Maxwell. 3, A. F. Faulkner. *hc*, R. Reid. *Chickens*.—1, G. F. Lyon. 2 and *hc*, R. Maxwell. 3, H. Wilkinson, Earby, Skipton. *hc*, Mrs. Black, Castle Douglas; T. Kennedy; G. F. Lyon. *c*, A. Hentchison.

GAME.—Black Reds, and other Reds and Blues.—Medal and *hc*, J. A. Mather, Nithside, Closeburn. 2 and 3, J. Brough, Carlisle. *hc*, J. Robertson, Lochmaben. *Miss Knott*, Dumfries. 2, D. Walker, Heathfield, Holywood. R. Bryden, Lochmaben. *Duckwings*, *Whites*, and other Greys.—Medal A. McAdam, Castle Douglas. 2 and *c*, J. A. Mather, Nithside, Closeburn. 3, J. Brough. *hc*, J. Robertson. 2.—Martin, Meltrum, Georgetown, Dumfries; J. A. Mather; J. Craig, Dumfries. *c*, J. A. Mather.

HAMBROGS.—Golden-spangled.—1 and 2, G. F. Lyon. 3 and *c*, W. Martin. *Silver-spangled*.—Medal, W. Martin. 2 and 3, T. Murray, Dumfries. *Golden-pencilled*.—Medal, W. Martin. 2, T. Murray. 3, W. Linton, Selkirk. *hc*, R. Muir, Cairnhill, Kilmarnock; G. F. Lyon. *c*, L. Bouch, Aspatria. *Silver-pencilled*.—1, W. Martin. 2, J. Lochhead, Kilmarnock. 3 and *c*, R. Muir.

HOUDANS.—Medal, A. Wither, Stranraer. 2, Miss H. Robinson, Wigton. 3, J. Lambie, Pathhead, Cumnock. *hc*, Miss H. Robinson; L. Bouch. *hc*, Miss H. Robinson; G. F. Lyon. H. Wilkinson; R. Carlisle, Nunholm, Dumfries. *c*, D. B. Hope, Oakfield, Dumfries; J. Pool, Milnfeld, Annan.

SCOTTISH GREYS.—1, J. Pool, Beith. 2 and *hc*, G. F. Lyon. 3, A. H. Paton, Cross, Kilmarnock. *c*, W. Lawson, Pleasance, Dumfries.

ANY OTHER VARIETY.—1 and 3, W. Martin. 2, R. Reid. *hc*, G. Anderton, Accrington, Lancashire; D. B. Hope (Hornets); Miss Knott (Polands); J. M. Wilson, Kilmarnock; A. Wylie, Johnstone, Paisley. *c*, Miss Knott (Poland).

SELLING CLASS.—1, R. Irvine, Kirkhouse, Milton, Carlisle. 2, W. Martin. 3.—Wallace. 4 and 5, G. F. Lyon (Cochins and Ducks). 6, W. F. H. Arundell. *hc*, W. Martin; W. F. H. Arundell. *hc*, R. Armstrong, Abbey-croft, Carlisle (Bantams); G. Anderton; G. F. Lyon (Brahma Pootras); R. Reid; W. F. H.

Arundell; R. Kerr, Closeburn (3). *c*, Miss Knott (Dorkings and Cochins); J. Pool.

DUCKS.—*Aylesbury*.—1.—Wallace. 2 and 3, G. F. Lyon. *hc*, M. Smith, Townhead, Thornhill; W. Martin. *hc*, Major Bowden, Lochfield, Maxwelltown; M. H. Maxwell, Dumfries; Mrs. Pattie, Castlewards, Torthorwald (2); W. Martin. *Rouen*.—Medal, W. Martin. 2, J. A. Mather, Nithside, Closeburn; G. F. Lyon. *hc*—Wallace; G. F. Lyon; 2, Maxwell, Auldgarth; W. Martin; W. F. H. Arundell. *c*, W. Lawson.

BANTAMS.—*Gold and Silver-laced*.—1, 2, and 3, J. Robertson. *Black*.—Medal and 3, R. H. Ashton, Mottram, Manchester. 2 and *hc*, J. M. Laren, Kilmarnock. *hc*, J. Robertson. *c*, J. Robertson; W. Robertson, Stewarton; J. Lochhead, Kilmarnock; W. Atkinson, Fellside, Kendal. *White*.—1, J. Robertson. 2, G. McKechnie, Fairgirth, Colvend.

GAME.—*Black Reds and other Reds*.—Medal, W. Atkinson. 2, J. Huie, Kendal. 3, J. Mair, Belzies, Lochmaben. *hc*, Miss H. Robinson, Wigton; M. Smith, Townhead, Thornhill. *hc*, J. Morrison, Gateside, Colvend; A. Blair, Lambhill, Dollar. *c*, M. Smith. *Duckwings and other Greys*.—1, R. J. Hartley, Altrincham. 2, G. Briggs, Dumfries. 3, J. M. Laren, Kilmarnock. *hc*, J. Little, Dumfries.

PIGEONS.

POSTERS.—Medal, J. M. Donald, Portobello. 2, W. S. McAllister, Lanark. 3, Miss Knott.

CARRIERS.—Medal and 2, S. D. Raddeley, Hereford. 3, A. Hutchison, Stranraer. *c*, J. E. Spence, Broughty Ferry.

FANTAILS.—1, T. Douglas, Thornhill. 2, J. C. Spence. 3, J. Lambie. *hc*, Miss Knott; T. Douglas; Cumming & Fleming, Cross, Beith. *hc*, J. F. Liveridge, Newark (2); T. Douglas.

TUMBLERS.—*Short-faced*.—Medal, W. Brydone, Langton Main, Dunse. 2, J. Turner. 3, J. Smart, Montrose. *hc*, F. Douglas. *c*, E. McKie, Maxwelltown. *Common*.—1, J. Thomson, Maxwelltown. 2, Cumming & Fleming. 3, J. Brydone, Gavinton, Dunse. *hc*, J. Craig, Dumfries; J. Day, Edinburgh. *hc*, J. Hannah, Maxwelltown (2); J. Douglas, Dumfries; J. Stewart, Pathhead, Cumnock; R. Kerr, Closeburn. *c*, J. Murray, Maxwelltown; J. Turner. T. Douglas (2); R. Kerr.

BARBS.—1, J. E. Spence. 2, J. Brydone. 3, R. Service, Maxwelltown. *hc*, W. Brydone. *hc*, J. Craig, Dumfries. *c*, E. McKie; J. Day.

JACOBS.—1, W. Brydone. 2, J. Brydone. 3, J. Lambie. *hc*, J. Lambie; J. Smart, Montrose.

ANY OTHER VARIETY.—Medal, J. & W. Towerson. 2, A. Hutchison, Stranraer. 3, J. Brydone. *hc*, J. Lambie; A. Patrick; J. & W. Towerson. *c*, J. Smart; W. Shearer, Dumfries (Turtle Doves); G. Black (Turtle Doves).

CAGE BIRDS.

SCOTCH FANCY.—*Yellow*.—Cock.—1, J. Thorpe, Dumfries. 2, J. Wilson, Greenock. 3, A. Harkness, Kirkcubbin. 4, R. Bryden, Lochmaben. *Hen*.—1, and 4, R. Bryden. 2, A. Harkness. 3, J. Little, Dumfries.

SCOTCH FANCY.—*Buff*.—Cock.—1, J. Little. 2, A. Harkness. 3, J. Thorpe, Dumfries. 4, J. Ritchie. *Hen*.—1, W. Love. 2, J. Ritchie. 3, J. Little. 4, A. Harkness.

PIEBALDS.—*Yellow*.—Cock.—1, J. Little. 2, J. Thorpe. 3, J. Stewart. 4, R. Bryden. *Hen*.—1, W. Clark, Langholm. 2, J. Thorpe. 3, J. Ritchie. 4, J. McCreedy, Stranraer.

PIEBALDS.—*Buff*.—Cock.—1, R. Bryden. 2, J. Ritchie. 3, J. Thorpe. 4, J. Little. *Hen*.—1, J. Little. 2, J. Wilson, Greenock. 3 and 4, J. Thorpe.

BELGIANS.—Cock.—1, J. Thorpe. 2, J. McQuhae, Maxwelltown. 3, J. Wilson, Hen.—1, J. McQuhae. 2, J. Edgar, Maxwelltown. 3, R. Bryden.

G. LOUPIN MULES.—*Yellow or Buff*.—1, J. Thorpe, Dumfries. 2, J. Richardson, Dumfries. 3, J. Russell. 4, W. Thomson.

GOLDF. NCH.—1 and 4, J. Thorpe. 2, A. West, Lockerbie. 3, D. Copland. **SELLING CLASS.**—1 and 5, A. Harkness. 2, R. Bryden. 3, J. Thorpe. 4, R. Edgar. 6, J. Little.

PARROTS OR FOREIGN BIRDS OF ANY DESCRIPTION.—1, J. M. Wilson, Kilmarnock. 2, D. Shearer, Dumfries. 3, A. Smith. *hc*, Miss C. Charteris.

JUDGES.—*Poultry and Pigeons*: Mr. E. Hutton, Pudsey, Leeds. *Canaries*: Mr. R. Crawford, Kilmirrie, and Mr. T. Buchanan, Glasgow.

KILMARNOCK POULTRY AND PIGEON SHOW.

(From a Correspondent.)

Pouters numbered 125 pens, and, though some noted lofts were unrepresented, the quality was quite up to what we have seen at Glasgow and Edinburgh. We were curious to see if the "Any other colour or marking" controversy would have any effect in altering or modifying the judging of Mr. Huie this year, more especially as we heard some little grumbling among the Glasgow men as we entered. Before going over the classes we confess to a little surprise that several noted birds were not placed higher; but after a careful examination, with the necessary allowances in criticising this variety, it was our opinion, with the few exceptions noted below, that Mr. Huie had done his work in his usual admirable style. But let no one suppose that his colour and markings will be leniently dealt with. The controversy has not touched the sacred standard, and all alarm may now cease. Shape, with colour and markings, constitutes Mr. Huie's *Pouter*.

The Black or Blue cocks showed few indifferent birds. 592 deserved the commendation awarded; 594, a nice bird in bad order; 595, fourth prize, had nice globe and style, but was too short in feather; 598 ought at least to have been commended; 599, third-prize, we did not much like; 600, second-prize, a splendidly limbed bird, close up to 606; the winner, a splendid Black in all points. No. 604 was a good bird as we saw him, not noticed.

Red, Yellow, and Mealy cocks were put together. Fourth-prize, a finely shaped Yellow, well marked but bad in colour. Same may be said of third-prize; 612, a capital bird, deficient in globe. The first and second were well placed, and good deep Reds; pen 624, highly commended, was one of the surprises. This bird has got a trifle heavier in shoulder, but in show he is still a splendidly shaped bird. He is bad in colour and only fair in marking.

Any-other-colour cocks showed nothing special, with the exception of the winner. We thought the fourth-prize a mistake, as he showed a hooked limb and appeared deficient in style. Better birds, in our opinion, were passed over.

Black or Blue hens were very good. The first and second

were splendidly limbed, but we failed to get them into proper show; the third was a nice Black; 643, a good Black, too shy to show; 649, the fourth, was showing beautifully as we passed, and might have taken the honours had her moult been completed. 652 contained a meritorious hen, highly commended.

In hens, the Reds, Yellows, and Measles competed. 656, third-prize, was very good in shape but washed-out in colour; 662 contained a nice Yellow hen. We preferred the second-prize to the first in this class; 664 contained all that a hen Pouter should be, beating all in the class easily. Her colour (mealy) must have weighed heavily against her.

In Any-other-colour hens the first and second were well placed, but we preferred 672, highly commended, to the third and fourth.

Young cocks formed an excellent class, and the most exacting could find no fault with the judgment. A commendation was here worth something. The winners were first-class birds. 688 contained a nice bird, thin in limb. We did not admire the hooked limb in the highly commended pen 689. 690 contained a promising bird rather gay in marking.

Young hens were also an excellent class. 692 was full of excellence, save in colour; so also was 694, but both were left out in the cold. First and second were good in limb, but the fourth beat all in the class for style. We thought her, however, a little short in feather to look at.

Carriers.—The cock class had some good specimens. The first and second-prize birds were grand. In hens, the only bird good all round was Mr. Baddeley's. None of the others deserved special notice. In the class for birds bred in 1874, the first and second were strong and long in feather and face, the first somewhat Parrot-beaked; we liked the second better, he was better eyed, and had a good box beak. Perhaps a suspicious blank in the plumage in the neck had something to do with the placing of the bird.

Short-faced Tumblers were only fair, we have seen better birds when a local fancier exhibited in this class. The first was good in colour, but deficient in head properties.

Barbs contained nothing of special note; there were none of those old used-up worn-out birds, whose life must be burdensome to themselves, but there were a few with the requisite width of skull. They were as well judged as could be expected considering the birds to be dealt with. In Barbs bred in 1874 Mr. Charlton must have overlooked the white tail in the hen in the first pen; besides, we suspect her neighbour had made her debut in 1873. This class was only fairish.

Trumpeters.—Mr. Vander Meerach's Black first, closely followed with Mr. Lederer's Mottle; none of the others above mediocre, and some far below it. We would have awarded the special to this class, as the best bird in it was superior to anything in either Short faces or Barbs.

Fantails.—A large class, and to the uninitiated every bird as good as its neighbour, and a great deal better. Mr. Charlton must have had some difficulty in selecting the prize birds, and yet we think his decisions were correct. The Beith fanciers have got the right thing in Fans and they came well to the front.

Jacobins.—Fifty-three pens, the largest class in the Show. Mr. Brydone put his best foot foremost here, and won with a splendid Jack; Mr. Gilmour's second was a Red; third, a well-conditioned White, and the fourth a Yellow. Some of those left out in the cold were fully as good as the last two.

Turbits, in pairs: here Mr. Brydone had luck, being first again; we think this was the most manifest mistake Mr. Charlton made. How he could overlook their faults we cannot divine; they did not match, one was a peak the other a shell, or rather they were neither the one nor the other. We would have put third first, and fourth second; Mr. Angus's second third, and Mr. Muir's 933 fourth.

English Owls.—We were disappointed with this class, most of the birds were badly matched; Mr. Ridley's birds were kite-barred, but were placed first. We liked Mr. Yuill's 962 better; in head, beak, gullet, and rose they were head and shoulders beyond the other, but perhaps they had too much African blood in them.

Flying Tumblers had classes for Self-colours and Blue-barred, or Any other colour. First, in Selfs splendid Blacks; capital Mottles carried off the honours in the other class.

Balds or Beards, Long or Short-faced; this is a mistake, and always unsatisfactory: the Committee must separate the classes next year. First were nicely bearded, but very bad in colour. Fourth were also neatly bearded, but worse even in colour. Second and third were Balds, the latter neatly cut and good in colour, and might have been more forward in the prize list. The owner of a pair in this class in penning his birds allowed one to escape. Being called in question by one of the Committee for coming rather close up to the Judge, he explained that he merely wanted to say that the bird that had escaped was quite as good as the one left, and he hoped this would be kept in view while judging them. Had he been allowed to communicate the same, we would like to have been near Mr. Charlton; his face would have been a study for an artist.

Common Pigeons.—Seventeen pairs exhibited; this class might well be dispensed with.

Nuns were a fair class. Some birds, otherwise meritorious, lost themselves through want of condition and cleanliness.

Any other Variety were a very mixed lot indeed, African Owls first, Dragoons second and third, and Swallows fourth; a pair of foreign Owls, superior to the first, were evidently overlooked.

Selling Class, limited to 20s., contained nothing of note. We would advise the Committee to make the limit £3; as it was, several pairs were very cheap. First, Yellow Jacks; second, Red Barbs; third, Ice Pigeons; fourth, Blue Owls.

(From another Correspondent.)

THE following remarks are in continuation and conclusion of those given last week:—

Jacobins, Any colour, were a very large class, fifty-two pens in number. The first prize was given to a Yellow, a splendid bird, which also carried the extra prize; second a very good Red third a White, which we considered did not warrant the place; fourth a very good Yellow. This class contained many fine specimens, and taking into account its great size, must have been most bewildering to the Judge. With the exception of Trumpeters we do not know any class that has improved so much as Jacobins within the last few years.

Turbits, Any colour, in pairs.—This was a very pretty and large class, embracing most of the colours, but unfortunately many of the pairs were badly matched. The first-prize was Silvers, much too coarse for our taste; second-prize Reds, very fair birds; third Blues, which we thought the best of the three pairs. The class contained a great many remarkably fine birds, which would have appeared to greater advantage had they been shown singly.

English Owls.—A good-sized and pretty class. Many of the birds, however, appeared much too large and coarse.

Flying Tumblers, Self-coloured, in pairs.—This was a large and well-represented class, and particularly interesting to young fanciers, embracing also Mottles, Beards, Baldheads, &c. The winning birds—viz., Blacks, Reds, Whites, and Yellows, were very well placed, the Mottles, &c., having no chance in a class for self-coloured birds. Tumblers, Any other colour, a smaller but equally good class, containing Mottles, Splashes, &c. In this class were several pens competing for a prize offered for the best house Tumbler. Such birds were taken into the Committee-room and tried singly one after another, a novelty at Pigeon exhibitions. The prize was won by Mr. Miller's bird. The performance of this bird was something remarkable, it seldom rising above 1 foot from the floor, in which space it tumbled once or twice each time it rose. Mr. Miller has been long celebrated for this strain of birds.

Beards or Balds.—A large class, comprising both varieties. As it contained both long-faced and semi-short-faced birds, it must have given the Judge a great deal of trouble. Many of the birds were badly coloured, others bright in colour, others not very evenly matched, but upon the whole a good class.

Common Pigeons.—Though this class has little attraction for the experienced fancier, it is of vast interest to those young aspirants whose purses do not allow of great outlay, but whose names getting into print constitute them at once members of the fancy. In this class there were a great many very pretty birds, such as we used to prize in our earlier days.

Nuns.—With one exception this class were all Blacks. There was not the trimming in this class which we have so frequently seen at shows.

Any other variety.—A large class, and of great variety. The awards in this class were well dispersed throughout.

Selling Class.—Large, and of considerable variety, from Pouters downwards.

RABBITS.—Variety not a large class, but evidently increasing in number of entries.

CANARIES.—There was a large show of those birds—139 cages, all Scotch Fancy, little known in the south. In numbers they were larger, and the Judges pronounced them superior to former years. There was also a very pretty assortment of Males between the Goldfinch and Canary. Among those birds was one of exotic appearance, a Mule between the Goldfinch and Bullfinch, which attracted much attention. This Mule has been for many years successfully bred in Scotland. There was also a very pretty class of the Goldfinch, now a *rara avis*, though it used to be indigenous to Britain.

In concluding our remarks on this Show we may state that the total entries amounted to 1422. There were only two faults which occurred to us (and what show is perfect?); notwithstanding all the care and anxiety of the enthusiastic Committee—the tables upon which were placed the Pigeon pens were from 12 to 15 inches too low. A visitor under the middle size had to look down upon the birds, not at them; therefore even the Judges were placed at a disadvantage. The Committee, however, had supplied the Judges with one of the Scotch moveable show pens, which did great service. The other fault to which

we allude was the shortness of time allowed for judging. The judging began about 10.30. The doors were open to the public at 12. There were evidently one or two slips in the last two classes in Pouters, cocks and hens bred 1874. This is accounted for by the crowding of visitors into the Show before the judging was finished. The Committee is fully alive to those disadvantages, and intend to have a full day for judging in future, as well as an alteration in the tables named.

UNITING BEES.

I HAVE much pleasure in complying with the request of your correspondents to describe the mode of uniting bees practised here for some years with invariable success. At the same time I must confess to a series of failures previous to the adoption of the system, and it was only after a long and careful study of the habits and instincts of the bees themselves that we succeeded. I say we, because I am much indebted for his experience in the matter to a neighbour who keeps from eighty to a hundred hives, and who throughout the season will unite the above number, including those bees he gets from others in the neighbourhood who are about to destroy them to get the honey. He drives the bees and unites them to his own stock. I keep from fifteen to thirty hives, and admit not having the large experience he has.

By comparing notes we have come to the conclusion that the following is the best mode of uniting, after many a trial, and though others of your correspondents in their descriptions of the process of uniting come pretty near it, there are one or two points not noticed to which we attach great importance. We have tried the smearing process, but believe it to be very injurious to the bees, and wonder now why we ever tried it, seeing the extremely clean habits of the little workers. To smother them over in their own sweets is, to say the least, cruel, and bees once smothered in the way recommended never do any good until a young stock is reared. We admit they lick each other clean again, but the hair on the bees is generally all destroyed, which cannot be good for them; and besides, it is no preventive of fighting if they once begin, as we have proved over and over again. But to our process; and that it may be useful to the generality of bee-keepers I will first state the way in which we proceed with the common straw or wooden skeps with fixed combs, and then that which we adopt with the Woodbury or moveable bars.

First, then, we attach great importance to thoroughly frightening the bees before we begin, by blowing from a piece of cotton rag some puffs of smoke into the mouth of the skeps to be operated upon, and giving the skeps several good raps with the hands. Shut up the entrance, then, turn both skeps upside down; this will set the bees at once to fill themselves with honey. If it is known that there are plenty of cells with honey not sealed up they will fill themselves in ten minutes; but that there may be no doubt on the point let them be twenty minutes in this position, continuing to give them good raps with the hands to rouse them, at the same time getting everything prepared for what will follow. Place beside the turned-up skep another empty skep or box the same height, for the skep which the bees are to be driven into to rest upon; then gently remove the board (any bees in it should be shaken into the skep), next place the empty skep over the one the bees are in, and give some raps with the hand, when they will run into the skep prepared for them in about two minutes; draw back the skep till the two edges meet—the skep will rest on the one set for the purpose—let the edges of the two skeps nearly join, leaving only sufficient room for the bees to pass from the one skep into the other. All the bees and combs will now be exposed. It is well to have the two edges of the skeps meeting at the ends of the combs. When the bees run along the combs into the skep, a few puffs of smoke and raps with the palms of the hands will soon cause them all to leave the hive.

The queen must now be sought for and destroyed. This is done by laying a bag or such-like cloth on the ground, and placing an empty skep on the end of it, with the front raised about an inch by means of two wooden wedges. Then shake a few bees down on the sack or cloth, and look for the queen as the bees run into the empty skep, which they will do rapidly if they do not hear the sound of the bees still remaining in the hive, which should be covered with a board and moved aside a short distance. Shake out more bees on the cloth until the queen is found. Should she not be found on the first trial, after all the bees have been shaken out, which sometimes happens, the same process must be repeated by causing them to run again into the hive they were shaken from.

This may seem a laborious process to those who have not tried it, but really it requires less time to perform than to describe it. If the queens are both of the same age they may be united without catching one of them, but in that case it sometimes happens that a queen-encasement takes place, which causes annoyance and sometimes danger to the queens. It is soon observed when an encasement takes place by the unsettled state

of the bees, in fact they sometimes leave the hive. When that is seen lift the skep, and either one or two balls of bees will be seen with a queen encased in each. One of the queens must be destroyed, when they will soon settle. We always catch the queens we wish to destroy in case of accidents.

The two hives are then taken into a dark room with a lamp burning very low—just sufficient to see the bees, the flame of the lamp covered with a glass globe in case any of the bees take wing, which they seldom do. We use a paraffin lamp. Lay a cloth on the floor, remove the board from the hive which is to receive the bees, then shake some of the bees out of the skep from among the combs. If the skep is heavy this shaking is not so easily performed. In that case we run or drive about five thousand, or 1 lb. of bees, into an empty skep, and shake those bees on the cloth in front of the skep from which they have just been driven, then shake the whole of the driven bees among them, when they will all run together into the skep. If the weather is warm the wedges must be lifted a little higher to give air, as whenever the bees are disturbed the temperature rises, and the bees will not run in readily if it is too hot, but if sufficiently cool they will all run in in a few minutes. They should remain in a dark room all night, and be placed on any stance next morning. Not a single bee will be lost or fail to find out its home.

The process with the moveable bars is slightly different in practice, the principle is the same. We give them the smoke and raps with the hands, but do not turn them upside down. After removing the top, which alarms them enough, we take out the bars till we find the queen to be destroyed, then place the other skep to run the bees on the cloth, with the wedges inserted as before; shake the bees from two or three of the combs on to the cloth in front of the skep, take out the combs from the skep from which the queen has been removed, and shake all the bees off the comb among the bees on the cloth, when they all go into the skep as in the former case. It may seem from the description of both processes that the latter is the easier, but really the operation can be performed with the one sort of hive as speedily as the other, with the exception of its being more easy to get the queen on the moveable bar than by running the bees on the cloth.

The merits we claim for our system are, then, first we do not injure the bees in any way—neither by smearing with honey nor using fungus or chloroform to stupefy them. Second, we approach them as nearly as possible to the state they are in when swarming naturally by filling themselves with food, and by shaking a few of the bees from the skep in which the others are to be united on to the cloth; and mixing, as it were, the bees together on the cloth, they enter the hive as friends, ready to join in the advancement of the new home, and not as robbers; and third, we secure their complete subjugation by causing them to unite in the dark.

I may state, however, that though we advise the taking them into a dark room as an infallible cure for fighting, and also for uniting in spring when the weather is cold, we frequently let the mixing of the bees of both hives on the cloth out of doors before entering the hive suffice; but were we to see the least indication of fighting, we would remove both into the room at once. When the bees in the hive cease to make the familiar hum as those on the cloth and these meet, you may be certain of a fight, but if the hum is kept up by both parties it is a certain and joyful union.

When several swarms are to be put into one hive they are all driven into one empty hive first, all the queens having been caught except the one fixed on to keep, and mixed with the bees on the cloth as before described. A few weeks ago as many as eleven were united to one, on another occasion five, and another six. In other cases two and three are united, and I can safely assert that not a single bee was killed by fighting, unless robbers from other hives came among them, which they are very ready to do, as they soon smell the honey.—A. SHEARER, *Yester*.

P.S.—In my last communication there was a mistake in the printing, the price of the honey was 1s. 9d., you had it 2s. 9d.—A. S.

HIVES.

"APICULA" takes up the cudgels against wooden hives in defence of Mr. Pettigrew, but he must give us some better reason in proof of the superiority of hives of straw over hives of wood than the one only advantage he has alleged. We are all agreed that straw is a very excellent material for the manufacture of hives; it is both cooler in summer and warmer in winter, and wooden hives must be protected accordingly. I am not so sure as to the superior dryness of the one over the other. If coated with propolis in the interior the difference is *nil*, and all hives become so coated after a time. However, I will match this presumed advantage of the straw hive by the superior advantage of the wooden hive in point of durability; and the other I will match by the fact that I never yet heard of mice entering a wooden hive, whose entrances therefore do not require to be "narrowed so that only two or three bees can come out at the

same time," that is to say if the entrances are only properly contrived: whereas, narrow the entrances of straw hives as much as you please, you will never be secure against the entrance of mice any given night, as they can nibble the straw in a very brief time. This narrowing of the entrances of hives in winter I think a most objectionable plan, save only occasionally in very cold or windy weather. The more air that can find its way into a hive in winter in moderation, the better for the bees and for the hive itself.—B. & W.

THERE is an old saying, "The proof of the pudding is in the eating;" and after reading Mr. Pettigrew's condemnation of frame and other wooden hives, I am at a loss to understand how it was that at the Crystal Palace Show the straw skep was compared with the frame hive, "nowhere." In Class 8, "for the largest and best harvest from one stock under any system," but one exhibit appeared from a skep against eight from wood hives. The class for the best straw super of honey above 20 lbs., for which three prizes were offered, brought forward but two entries with not many pounds to spare; whilst for the corresponding class in wood twenty-eight competitors put in an appearance, half of them over 40 lbs. and one nearly 80 lbs.; and the same disparity, more or less, appears in classes of smaller weights. Suffice it to say, that with exactly the same prizes and conditions for supers, three classes each, straw sent six competitors and wood sixty-two: the disparity in gross weights was still more astounding. Thinking possibly Mr. Pettigrew is content with his 130 lbs. in the hive, without troubling for supers, I am at a loss to know why he or some of his disciples did not show in Class 20, "for the best display of comb for table use." Why, the surplus side combs from two such hives would have carried all before them; whilst the fact was, not a single entry came from a straw skep. Is not the assumption manifest that the skep-owners knew they had no chance.

Oh! what can Mr. Pettigrew be thinking of when he writes the hives used by the advanced bee-keepers of Scotland have not been altered or improved for fourscore years? In the name of conscience where is their advancement? Haa he never heard of the far-famed Stewarston hives? If not, I only wish he had been present at the Show to see the beautiful display of the purest honey and comb, all from the despised wooden hives, and to which we southerners were not ashamed to knock under. I echo the hope that many bee-keepers of England will emulate the apiarians of the north. Much may be learned from them, and perhaps they may gather a few grains of knowledge from us. Your correspondent says, if managed on the non-swarming principle, bar-frame hives are filled with brood from side to side. Could any better state of things be desired? Forty-eight thousand cells in a Woodbury hive, 48,000 young unhatched bees in their various stages, and this renewed every three weeks! Add on, say, 30,000 old ones—oh! what an army to fill a super with pure virgin honey in the whitest of comb never bred in, worth twice as much as any honey from the brood or bee-bread combs.

Mr. Pettigrew says he does not expect ever to find any other kind of hive equal to his for profit and convenience. I am not so presumptuous, and expect to find gradual improvements, which in time will render the best of our present hives obsolete; and now I say that moveable-frame hives are incomparably superior to any closed skep when used by apiarians of intelligence, and I believe that in this opinion I should be joined by nine-tenths of those who have ever given them a fair trial. "APICULA," in the Journal of Nov. 20th asserts, "At the Crystal Palace Show it is well known there was no exhibition of straw hives, therefore no comparison could be made." His assertion is wrong. Straw hives competed in four classes out of six, and comparison was made to their discomfiture; there was no reason why they should not have competed in the remaining classes. The controversy between straw and wood hives seems to me to have run into a wrong channel. I for one do not champion wood against straw, but a hive one can investigate against a hive one cannot. Have straw if you will, but don't work in the dark, even though the bees do.—JOHN HUNTER, *Eaton Rise, Ealing.*

[We have several more communications on this subject, and they shall be published as soon as possible.—Eds.]

OUR LETTER BOX.

COMMON PHEASANTS (*Alpha*).—You will have no difficulty in wintering your Pheasants. We keep our Golden Pheasants where they have no shelter of any kind. We kept them formerly where they could get under cover if they would, but they never availed themselves of it. They had perches without cover, and others in a roofed and sheltered spot. We never knew them use the latter, and when going round at daybreak in the winter we have often seen them on the outer perches with the white frost thick on their backs. They do not suffer in any way from the cold. Our common Pheasants never have any shelter. We hardly think you will do well to keep the two breeds together when the lying season comes on. We fear they will fight. Such a space as you describe, 60 feet by 15, will afford dividing, and a few Pheasant hurdles will enable you to do it at any time.

EGG PROTEINING (*Sobina*).—The accident you describe happens only to pullets. Nothing is easier than the remedy. Take a wing feather, dip it in sweet or castor oil, the latter the best, lubricate the egg membrane that protrudes and covers the egg. This will produce no action. As soon as it occurs introduce the feather between the membrane and the shell of the egg; the egg will be laid immediately. Watch the bird for a few days, and when uneasiness appears, indicated by a semi-upright position and by the tail drooping, catch her, take a feather steeped in oil, and introducing it into the egg-passages, keep on till you reach the egg, which will soon be laid. It is a disorder peculiar to pullets. You need have little trouble about the case.

HEAVIEST GOOSE AND TURKEY (*T. H. L.*).—We are unable to answer all your questions as we have to draw on our memory. We believe a Goose has been exhibited weighing 30 lbs. We have seen a Turkey that weighed 34 lbs. As a rule, the heaviest Geese are shown by Mr. J. K. Fowler, of Aylesbury, and the heaviest Turkeys by Mr. Lythall, brother to the Secretary of the Birmingham Show.

"COMMON" CLASS OF PIGEONS AT A SHOW (*A. Duffer*).—We apprehend that a good judge in judging this class would give the prize to a well-matched pair of true Dove-house Pigeons, which are properly Chequer, not as you mention, Blue with black bars. The class you name is such an unusual one that probably a judge would award the prize to the prettiest pair shown, which very likely would be some half-bred Tumblers or remote cross; but the Chequered Dove-house is undoubtedly the real common Pigeon of this country, known among naturalists as *Columba affinis*, or *Columba agrestis*, a chequered or dappled bluish bird; and a well-matched pair look very pretty. At the same time a Pigeon judge may know nothing of all this, and follow his own taste only.

DISTINGUISHING THE SEXES OF CANARIES (*W. H.*).—Cock birds are more bold and fierce in general appearance than hens and have a more bloomy plumage. Their heads are somewhat larger and longer than the hens', and they stand a little higher upon their legs. They are also more sprightly in their action. When in full vigour of song, especially approaching the breeding season, the cock birds can generally be told by (what is understood by the fancy), "blowing" them. Many fanciers can easily pick out the cock birds from the hens when in their nests. We profess to be at home on this point.

FEEDING CANARIES (*Idem*).—The food should consist of caecary, small hemp, German rape, varied occasionally with flax, millet seed, and a few groats, and powdered biscuit. Now and then a little German paste (if you know how to prepare it, may be given if the birds are kept for singing purposes. Breeding with them temporarily spoils their singing. Green food may be supplied in the spring time and during summer. In the autumn and winter months they are better without it. In the early spring dandelion (especially), and young lettuce may be given, and a little flowering groundsel and chickweed as the summer approaches, followed-up in June and July with plantain stems, plenty of which may be found growing wild. A little lettuce seed and a piece of salt the size of a bean can be supplied occasionally, both of which will tend to purify the system. No sugar at any time whilst the bird is healthy. The above dietary will suffice to keep them in good health.

AGE AT WHICH CANARIES SING (*Idem*).—Most birds commence to warble in their youth—about five or six weeks old. Like babies, when they once get into voice they make free use of it. At the above age the birds are not so free in song as when they have finished moult, which commences at about the age of eight or nine weeks, and continues the same number of weeks. After that they become free songsters, and swallow their little throats to the delight of both eyes and ears, in a very different manner to hen birds, which are deficient of that dash, style, and freedom peculiar to the cock birds. Much more could be said in reply to your questions, but we think this will suffice; at least we hope so.

REMARKS.

- 25th.—Rainy forenoon; looking likely for snow between 1 and 2 P.M.; damp and uncomfortable day.
 26th.—Fair, but rather dull early; fine at noon, and very bright for a short time after 1 P.M.; a very slight fall of snow at 9.
 27th.—Frosty day, but not bright, only occasional gleams.
 28th.—Fair, but rather foggy in the morning; began to rain about 2 P.M., but only slightly till 9 P.M., then heavily the rest of the day, and till midnight. Rapid fall of the barometer in the latter part of the day, the lowest reading being soon after midnight. A high wind in the night.
 29th.—Wet early, but the wind gone down; fine soon after 10 A.M., but heavy rain just before noon; fair but windy in the afternoon and evening.
 30th.—Dull morning, very dark fog soon after 11 A.M., and more or less so all day; very wet evening and night.
 Dec. 1st.—Rain in the night, but soon ceased, and it was the finest day during the week.—G. J. SYMONS.

COVENT GARDEN MARKET.—DECEMBER 2.

VERY little alteration to report in the general condition of the market. A large cargo of Pines has just arrived from St. Michael's, being the finest yet imported. The reports of blighted Potatoes from the different depôts are more favourable.

From observations taken near London during forty-three years, the average day temperature of the week is 47.1°; and its night temperature 34.3°. The greatest heat was 63°, on the 11th, 1844; and the lowest cold 7°, on the 16th, 1853. The greatest fall of rain was 1.24 inch.

VINE-PRUNING AND WINTER-DRESSING.

IT is not to teach the learned, but the several inquiring amateurs who are now essaying the winter treatment of their Vines, and are not too confident of the procedure best adapted for their purpose, that a few grains of instruction are hereby scattered. Vine-pruning must be adapted to the age, condition, and peculiar state of the Vines. On these circumstances the system of winter pruning must be founded. There are two cardinal forms of pruning the Vine—the short spur and long rod. There are also hybrids or modifications of these; also the two plans may often be seen in combination.

Let us start with a young Vine planted in the spring with a new rod to the top of the house. "Is that rod to be cut down?" "Considering the permanent welfare of the Vine, undoubtedly." "But will not that rod bear fruit if left alone?" "Certainly, if a stout perfected rod; moreover, the best bunches will not be near the bottom, but nearer the top of the house." "Then why cut it down? If it kills itself with work it may." That is the mode of reasoning of a self-knowing man, fond of asking advice and never following it. Picking up a grain here and there, and going somewhat different to all, he gets a first show of Grapes, and glories in the result as being a "plan of my own," having particular care to emphasise the "my." The Vine stands. It carries some good bunches of Grapes, but many of the lower buds break stubbornly, some not at all, and the side growths, although pinched, are weak. Well, they ought not to have been pinched. Never mind, a lot of fruit is had, but the Vine is ruined. That is killing the goose which would have laid the golden eggs. Another instance: If, instead of pinching all the side shoots, at the base one is selected; the eye just at the bend where the cane turns down to the rafter generally breaks freely, and this allowed to grow to the top of the house unchecked, will make a good rod at the same time the other carries the Grapes. Now, if the rod-bearing cane is cut clean out when the Grapes are all cut, the young rod will be ready to bear more. That plan carried out year by year is the long-rod system pure and simple. But some may say, "Oh! everybody knows that." I beg pardon, everybody does not know; and it is just these who require the information, and to whom alone it is offered. To assume that everybody knows everything, and that descending to simplicities is derogatory to one's reputation, is the great error of the times. If everybody knows a thing, why pen a line? and if we find one who looks with contempt on a thing plainly put, depend upon it that man is a hunter after information if he has need of it. But to proceed. That plan will produce a quantity of Grapes, especially if not followed out as stated, but if the first year's growth had been boldly cut down to the base of the rafter, and a year's grace given to get root-power, that seeming year's loss is really an eventual and permanent gain.

Those who want a large quantity of Grapes in a small

space of time, and who have no reserve—nursing canes—will find this long-rod system give them; moreover, it is more than possible they will be less troubled with shanking and other ailments than by the spur system. Mind, that is for amateurs who do not understand the whole *rationale* of Vine-culture sufficiently to work without aid, and who covet a quantity of Grapes as easily as possible, regardless of the way it is produced or the appearance of the Vines producing it. By that plan the bulk of the fruit will always be at the top of the house. To obviate this, take up two reserve rods by the side of the fruiting cane. Stop one nearly halfway up, and let the other go the full length. That will fill a house with fruit from the bottom to the top of the rafters. The half-length rod may extend to the top in the year of fruiting, and it will make a fine bearer the following year. Another from the bottom, stopped halfway up, will make sure for the lower part of the house, and so the roof may be covered with fruit year by year, every bunch from wood of the year preceding, no spurs having had time to form. With a good root-power to begin with, this plan is capable of producing an immense quantity of Grapes. It is the simplest of all forms of Vine-pruning. Anyone can do it who can cut away a dead Raspberry cane after fruiting, and train one young shoot halfway up the stake for bottom fruit, and another the full length for top fruit for the next year's work. The bottom half of the rod reaching to the top should, however, be divested of eyes, and the eyes on the bearing portion be thinned out to about 15 (not less) inches apart. This can be done in the spring by disbudding, and is essential in preventing an overcrowding of foliage, the most common of all mistakes in Vine-culture by inexperienced cultivators.

Leaving for the moment the long-rod or Raspberry system, let us look at the spur plan of treatment. The young rod of the first year should, if at all weakly, be cut boldly down to the bottom of the rafter, and not be allowed to bear a bunch. Strength will thus be concentrated to produce one fine young rod which, its other treatment being right, is sure to follow, and will lay the foundation for a good-constituted Vine for permanent work. If, however, the cane is stout, strong, and well-ripened, containing not more than a speck of pith, and is hard, round, and bright, then it may be allowed 2 to 3 feet of rafter, and carry two to four bunches. It will perfect these, and make a fine extension cane at the same time without any danger of overcropping; indeed the fine cane is the proof—the safety-valve that all is right on that side, the bunches being, as it were, the steam-governors. If these press heavily, if the rod does not progress freely, relieve pressure by removing a bunch or bunches as required, making above all things sure that the steam (the sap) has a full and abundant flow upwards to form a fine extension growth of vigorous cane. After this, yearly extension may, at each winter's pruning, be shortened to about a one-fourth length of rafter—that is, if the rafter is 16 feet, leave 4 feet. In very strong canes more is quite permissible, but as a rule that is a safe approximate guide. Now these side shoots which have borne the

bunches must be shortened. This shortening forms the spurs. Cut very smooth and clean almost close to the main stem—that is, leaving only the lowest prominent eye that has had the assistance of a leaf. There can be no mistake there—the lowest eye that has a leaf at its base to be left, the rest cut away. If the Vine is in a good estate, that eye is sure to push and show fruit. If this close shaving should frighten, two clear eyes may be left; this will give two shoots, and both will or ought to show bunches. In this case always rub one off, and let it be, if possible, the one farthest from the main stem. Some people will prune a Vine for twenty years, and in that time not accumulate a spur of 3 inches, while others will add to the spur at the least an inch a year. Close pruning is the best for this reason, that the lateral flow of sap is less impeded. Why? Look at an old standard Rose and its knotty swellings by yearly cutting. Note the narrow, restricted, twisted, curling sinuosities of the sap vessels. It bears small blooms, and well it may. Cut its head off, and see the immediate gross vigour of the after-growth. The impediment to free-sap movement is removed; the narrow tortuous channels are substituted by free, open, sap-courses. So it is with the Vine or any other plant. The plant—the Rose, the Vine—may not be in a bad state of health; the roots may be sound, and the foliage not indicative of any disease; the soil may not be seriously at fault, but may be reasonably well supplied as the food-store; yet, if not breaking down by disease, the plant may come far short of the perfectness of constitution desired, and fail in the character of bloom or fruit. The fault there lies in the transit of sap of food. As in the Indian famine, Rice was plentiful while the natives starved, but, a free channel of communication being provided, the plague was stayed. I am not sure that I have seen this idea expressed before, but many an example of a stubborn scraggy tree tells me there is something in it. On that account close spur-pruning is preferred to a longer mode, which in half a dozen years results in a curled knuckled accretion of wood and tissue through which the sap can only circulate by a sluggish crawl, inadequate to the real requirements of the fruit and foliage of the Vine it is attempting to feed. But an example may be in mind that Vines with long twisted spurs bear good and satisfactory fruit. Very well. Go on with the mode that answers. Nothing succeeds like success, and never change a plan that is satisfactory by whomsoever the change may be proposed.

Before closing these notes I should like to remark in the matter of a young Vine, that I do not think the common practice a wise one of divesting a young cane of all its eyes from the ground up to the rafter—that is, not sweeping them off at a stroke the first year. The upright sashes of houses may be from 4 to 6 feet. That portion of the Vine is not often required to bear fruit; still, for a year or two it is preferable to pinch a few shoots, and have a little foliage there rather than leaving the stem absolutely bare. The rod of a Vine so trimmed never thickens in the same proportion as the upper portion of the Vine. The sap channels are contracted, and often a Vine will form a protuberance of incipient roots at the base of the rafter where foliage commences to get the nourishment it needs, and which the contracted vertical portion of the stem cannot supply. A little foliage down to the very ground will change all this. The stem thickens freely, and affords a sufficient medium of conduct for the free unimpeded sap-flow. A young Vine so managed will be as thick at the base, even thicker, than at any other part of the rod; but divest it of eyes the first year 5 or 6 feet up from the bottom, and nothing can prevent it becoming thicker at the top, like a ladder reared wrong end upwards. In that case all the best fruit will be at the top of the house; in the other it will be equally good to the very bottom. This is not theory but practice. I will refer to older Vines another day.—J. WRIGHT.

A MODEL ROSE GARDEN.

"Now that the fields are dank and ways are mire," it is not unseasonable to write of Roses of the past, for Roses of the present are now at their very scantiest. I remember meeting at the Falls of Niagara with a somewhat singular entry in one of the hotel strangers' books. A young gentleman informs the public that

Next to the bliss of seeing Sara
Is that of seeing Niagara.

Certainly next to seeing Roses in the garden, every Rose-lover will admit, is reading of them in "our Journal." On this principle I do as I would be done by. But I have long been in-

tending to write about a model Rose garden—a town Rose garden I should premise. I am resolved that its beauties shall not blush unseen any longer. Some people who have small gardens ask, How is it possible for them to compete with the owners of acres? How can a town garden exhibit at the shows against a country one? There seems to be an idea that quality has no chance against quantity. I venture to think that this is a mistake, and that high-breeding and high-feeding, where the plants are really good, will command great success, even with quite a limited number. Now, it is "wholly in the busy world," as Mr. Tennyson does not say, and not

"Beyond it, blooms the garden that I love."

As the story books begin, "not a hundred miles from one of our flourishing suburban towns," in fact, in the very middle of it, is the garden of my admiration. The ground it covers is barely a quarter of an acre, and, of course, the poor Roses cannot have quite the whole of that. Yet on this little spot grow year after year Rose bushes chiefly on the Manetti, which, as the Scotch say, are "a sight for sair e'en;" in England we should remark, which are a "caution," and certainly they are to intending competitors. At the district show this little garden holds its own, and something more, against all comers, and that in a large and wealthy neighbourhood. If the show-day at all suits it, this garden will carry off the principal prizes. At present it holds one most keenly-contested challenge cup. I do most sincerely trust the happy owner will forgive thus being made into an example; but admiration compels, for, to adopt the half-appropriate motto of York Chapter House—

"Ut Rosa flos florum,
Sic hic hortus hortorum"

I know no such garden—and I know a good many—which, in proportion to its size, grows such Rose trees and supplies such Roses. I myself can grow at least three for every one that my friend does, and yet for robust plants, for size of flowers, for substance, for excellence of colour, I hopelessly admit that I dare not invite comparison. The position of this model town Rose garden no doubt has something to do with this. It has a southern exposure, protected on the north by a long row of houses, while a low wall bounds it on the west. And such Mlle. Bonnairs, such Marie Baumanns, and all the most shy-growing Roses as I have seen come out of it, really showing "rude health," if one could say so rude a thing of a lady.

On lately taking a box of twelve to an exhibition in a neighbouring county, my friend found himself only second, though far the best in the room, because "in that Association they were not accustomed to such very large Roses!" Some who read these lines may remember that exquisite Mlle. Bonnair, a Rose now seldom seen in its excellence, which stood unrivalled at one show as the best Rose in the room; and at another time how this garden furnished two such perfect boxes of Baroness Rothschild, that the despairing Judges at last requested that one of them might be taken away—they were far ahead of everything else, and so equal, and they could not both take prizes.

In budding, the owner of this remarkable garden is even more successful than he is with "the box." His Manettis never fail. I flatter myself I can bud Briar stocks, and not lose more than a per-centage of some four or five; but my Manettis are always being smothered in too much sap, or failing to take for some reason or other. Those he puts in never fail; the veriest dormant buds, which only he himself can see, are sure to develop in a year into wide-spreading bushes. He is also fortunate in severe winters, and loses very few. And now for the secret of his success. It is very simple. The famous Demosthenes was questioned as to what are the first requisites for an orator. He is said to have answered, "Action! Action! Action!" It is possible that in our colder-blooded clime we might not quite think so; but, at any rate, I have no doubt as to what would be my friend's answer. He would reply *à la* Demosthenes, "Manure! Manure! Manure!" Deep trenching and well manuring—there is the whole mystery.

Even at the risk of seeming interminable, I must go on to mention one other thing that I have learned from him, especially as I am not aware that "our Journal" has as yet taken cognisance of it, and that is quill-budding—the art of quill-budding. The old plan, and that given in all manuals of the rosery, after taking off the bud-shield, is to pick out the wood with the budding-knife, and a dismal business this is in the hands of a beginner—it is not always easy for the best of hands. Now, instead of this insert at the upper end a sharpened quill—

nothing is better than a quill toothpick—a slight push, and presto! in an instant the wood is out, and the much-relieved bud perfectly ready for insertion! It reads like a joke, but it is a convenient reality, that one chief requisite of budding now is a bundle of toothpicks!

To conclude, all those who have large hearts and small gardens, let them be assured that with a good aspect, with well-grown plants, and high feeding, great success is always attainable. Let them take example and encouragement from this model miniature town Rose garden. It will be observed that my admiration is not altogether disinterested. The buds that I get from it are the most perfect conceivable; the beatings on show days, when they occur, are equally undeniable. In short, it may be said of this garden that which a French Marshal (Niel, no doubt), once remarked of our army, "The English infantry is the finest in the world, fortunately for others there is very little of it."—A. C.

KEEPING GRAPES—DAMPING-OFF.

I HAVE on many occasions in this Journal written strongly against fixed temperatures for growing plants, and pointed out the necessity of working according to the weather; and now I wish to say that the same rule holds good with respect to keeping fruit and flowers, although for very different reasons. "Late vineries in which Grapes are hanging to be kept at 45°," say our advisers. Forty-five degrees is certainly a very good temperature in which to keep Grapes and many other fruits, and also flowers, provided always that you can altogether keep out the external air when it gets above that temperature; but this you cannot do with ordinary vineries, and it is of no use blinking the fact that 45° inside and 48° outside, very soon means a number of decayed berries. While the temperature outside ranges between 25° and 40° keeping fruit is a very easy affair; but let it rise suddenly to 50° or 60°, it then becomes altogether more difficult.

The sudden fluctuations of temperature this autumn have been very trying for those who have to provide a large table with dessert through the winter months. On two or three occasions since the fruit was ripe we have gone to bed when the thermometer was only a few degrees above the freezing point, the sky clear, and everything appeared to foretell frost; but before daylight in the morning all has changed, and the thermometer has been up near to 50°. This happening before the Vines had scarcely ceased growing was very unfortunate, and I have no doubt many have suffered from it severely, especially where the Vines were young and vigorous. Mine suffered considerably, for although the wood and fruit were thoroughly ripened most of the leaves were green and seemed as if they could not quite reconcile themselves to the fact that it was really autumn. I almost envied some of my friends who had their leaves scorched-up by the sun or eaten by red spider, and then I bethought that I could, perhaps, give the necessary check myself. I therefore cut all the laterals back to 10 inches or a foot, and kept a dry atmosphere, when the remaining leaves very soon ripened, and all has gone well since.

Has anyone noticed that different soils give different colours to Vine leaves in autumn? Alicante, for instance, in one soil will have a beautiful soft scarlet colour, in another it is bright yellow. Gros Guillaume grown in some soils has fiery-red edges and streaks, while in others it is dotted with yellow and pink. It is the same with most other kinds excepting Hamburgs, which I believe always turn yellow. I think, but am not sure, that lime has a great deal to do with colouring the leaves.

But I am digressing. A viney containing ripe Grapes should never have a lower temperature than that which prevails outside, and as long as frost is kept out it should not be very much higher. The safest plan, perhaps, is to always keep a little fire going, but it is of the greatest necessity when the outside temperature rises rapidly; for do what we will by ventilating, &c., when the outside temperature is rising, that inside our glass houses will also rise, and if the sun is shining will rise very rapidly, and the moisture contained therein will immediately be condensed on the coldest surface, which will generally happen to be the fruit. On the other hand, if the inside temperature is much higher than that outside, the moisture will condense on the inside of the glass. If the internal temperature is only slightly higher than that outside, both the fruit and the inside of the glass will be perfectly dry, even though it rains in torrents, and you are also watering plants inside the house. Let me not, however, be understood

to recommend keeping plants inside a house which contains ripe Grapes, because with the greatest care you cannot always prevent the moisture condensing on the fruit when a sudden rise of temperature takes place, and then the greater the amount of moisture in the house the greater will be the difficulty.

Greenhouse flowers and plants often damp-off from the same cause that Grapes do—viz., the temperature of the air about them rising rapidly while the soil and the thickest parts of the flowers are still cold and consequently attract the moisture. Damping-off does not always proceed from excessive humidity of the atmosphere; it is quite possible for plants and flowers to damp-off in an atmosphere that is really too dry for healthy growth.

I feel great difficulty in making my meaning clear on the above subject, but I trust I have said sufficient to cause some of my readers to think the matter over for themselves, for I consider it a very important one.—WM. TAYLOR.

THE AURICULA.

ALL lovers and growers of this beautiful flower must be indebted to my friend the Rev. F. D. Horner for his valuable and exhaustive papers; he evidently looks at Auriculas with the eye of a lover and a critic, and one must almost envy the riches in which he revels, and also the opportunity he has of intercourse with those who are interested in the flower. We, certainly, in the far south are much less ardent, and I believe also labour under more difficulties in their growth. As the Auricula is naturally a denizen of alpine regions, the cold and breezy moorlands of Yorkshire, or even the "banks and braes" of Scotland, suit it better than the warmer valleys and sheltered nooks of the home counties. Thus, for example, this autumn has been destructive of our hopes of a good bloom next spring, or I am very much mistaken. The warm and lovely days that we had in September and October drove them into bloom so rapidly, that I am sure more than one-half of my blooming plants have thrown up autumn trusses; and on talking with the only growers I know I hear the same report from them. As these were evidently those intended for the spring bloom, I cannot imagine that I can have from these plants anything but a feeble and late bloom. Now Mr. Horner says he has had but little autumn blooming; and as we pot at the same time, I can only attribute this to the cooler atmosphere in which they are grown. The worst of it is not over, for on looking through my frames to-day I see some of my largest plants with fine large trusses coming up.

I cannot say anything of many of the new varieties which Mr. Horner mentions, but his remarks on the older sorts are so sound that I have no doubt that we may rely on what he says of them. I should very much like next season, if all be well, to visit the National Exhibition, and then to see what our northern friends are doing.—D., Deal.

WINTER CUCUMBERS.

I VENTURE to give "S. J. A." my experience of the above. The finest house I ever had was at Rangemore, Burton-on-Trent, under Mr. Bennett. Cuttings of Rollinson's Telegraph were struck in August, and grown-on in pots until the middle of September, and then planted out. Not a fruit was allowed on them until each plant had filled its allotted space, which they very soon did. No more fruit was allowed on them than was absolutely required, the foliage being allowed plenty of room to develop itself, and the male flowers kept off. We were entirely guided by the weather as regards temperature, the thermometer often being down to 60° at 6 A.M. They were never allowed to know the want of water at the root, and the syringe was seldom used; red spider and mildew being kept down by damping the walls and floor with ammonia from the gas house, air also being given them from the front of the house on all favourable occasions. Under this treatment the plants did so well that Mr. Bennett did not like to pull them up in the spring, but allowed them to fruit all the summer.—R. L. M.

LARGE CHESTNUT AND ASH TREES.—I send the measure of some fine Spanish Chestnut trees in Oak Park, Tralee, Ireland. The largest, a splendid tree, is still in full vigour; its stem measures 17 feet 3 inches in girth at 3 feet from the ground, and 13 feet 9 inches at 12 feet. The second tree measures

11 feet 4 inches at 3 feet from ground. The third 11 feet 10 inches at 3 feet; and the fourth, blown down, measures 13 feet at 3 feet from the soil, and 10 feet 10 inches at 11 feet. They all have the appearance of being perfectly sound. There is also close to them a common Ash with enormous spreading head; its trunk measures at 4 feet from the ground 13 feet in girth.—H. VINE, *Gardener*.

ICE HOUSES AND ICE HEAPS.

["D" and other correspondents having made inquiries on these subjects, we reprint the following from a communication received from the late Mr. Robert Fish.]

Fig. 144 is a section of the egg-shaped well as commonly built, with a trap drain from its bottom, and the bottom covered over with logs of wood and rough brushwood for a depth of a foot or 18 inches. It is furnished with a passage and a door outside and inside, so that the space between them may be filled with straw. As will presently be seen, we prefer

Fig. 144.

Fig. 145.

a, Double doors.

b, Steep bank.

c, Surface line.

doors were on the south side of the roof, the ice never failed. The roof was formed of 12 inches of thatch, and then fully a foot of close heath or ling. The ice was pretty well beaten outside, pitched in at the doorway, and then pounded down inside. Nothing as a house could be more simple, or keep ice better; and, the ice being taken from clean water, venison, game, &c., were kept in the house for long periods untainted.

Where dryness may be secured there need be no objection to sinking the well wholly below the ground. In soils retentive of moisture care should be taken to prevent the outside moisture penetrating through the walls, by building them in cement, ramming clay round the wall, with tar next the wall, or raising them partly, or nearly wholly, out of the ground. It is quite a mistake to suppose that to keep ice well you have merely to get it into a hole beneath the surface of the ground. On an average the earth will be warmer all the year round at the depth of the bottom of the well than at the surface. All moisture getting to the wall would melt the ice; the moisture that would ooze out from a wall above the ground would actually cool the interior by evaporation.

I have not had any ice houses entirely above ground under my own charge; but I have noticed how well the ice kept in several, though, as far as I recollect, half as large again as the size mentioned above. I remember one house above ground that was built with double brick walls, the walls being separated 12 inches from each other, with a door in each wall opposite each other, about 5 feet from the ground level. The top of

a double wall instead of a single one, with an open space between of from 9 to 12 inches. The opening shown at the top is of great importance for filling the well, where the position of the ground will admit of it. If a layer of clay can be rammed against the outer wall it will be an improvement. The ground around the well should be shaded with trees and evergreens.

Fig. 145 is a section of one of the simplest and best ice houses I have met with. As far as I recollect, it was built square, with stone walls 16 inches thick, enclosing a square of 16 feet by 18 feet deep. One side abutted on the level of a field, and the opposite one on a deep sloping bank, the base of which was below the bottom of the ice well. The ground being light the drain was of little use, as the moisture escaped at the bottom. The ice was carted along the level meadow to a platform at the doorway. There were two doors; the outside one was of stout deal, on hinges which enabled it to fold back on the roof. The corner one fitted loosely in a groove, and this door was lined with woollen cloth. Though these

the house, steep and cone-shaped, was thatched to the thickness of 18 inches, and extended beyond the walls for a couple of feet. The outside thatch got covered with mosses and lichens, and there was a dense shade of trees over all. A temporary staircase led up to the doorway, and a stone staircase inside led to the bottom of the house. The ice was pitched in from the carts, and broken inside, and it kept remarkably well. The great secrets in this case were the double walls and the enclosed space for air between them. Of all non-conductors of heat, enclosed isolated air is the best. Neither what we call heat nor what we call cold has the power, to any great degree, to pass through it. I recollect once noticing in the end of June the thermometer in the shade against the outer wall of such a house indicating 77°, and another thermometer on the wall inside the ice well ranging from 32° to 34°, but we shut the doors behind us.

In sunk wells this double wall is just of equal importance. The outer one prevents the heat of the soil affecting the ice. I met with a nice example of this some time ago. An old-fashioned ice well had been so built, and answered remarkably well. In course of time three or four ice tubs had to be supplied at the mansion instead of one—everything in summer had to be cooled with ice—and the supply, from the house being opened so often, was not equal to the demand. The supposed genius of the establishment counselled the removal of the inner wall, which would at once make the house about 3 feet wider from top to bottom, and set at liberty so many thousand bricks

for other purposes. What could seem more feasible? and accordingly it was done, and the house well filled the next winter; but the enlarged house was emptied fully six weeks earlier than it used to be before. Since then the waggon-loads of straw packed against the walls inside, and the trouble, would soon cost more than the double wall, and, after all, with far inferior results. Few things are better non-conductors than straw, especially if not much bruised by the flail or threshing machine, as every space between the joints is so far a sealed-up air-tube; but let that straw get thoroughly soaked inside a house, and its non-conducting powers would not only be gone, but vapour always rising from it would keep a damp fog always resting upon and melting away the ice. I have no faith, therefore, in straw as a non-conductor inside a house unless it be kept dry. I have a large house which, when filled, generally secures pretty well a two-years supply; that, too, had been built, I believe, with hollow walls, and the inner one was removed, before I knew it, to increase the size; but I soon gave up using packings of straw, having come to the conclusion that, on the whole, from getting damp it did more harm than good. When either a stone, brick, or wood house is raised partly or wholly above the ground level, covering the single wall, whatever it is, with from 6 to 9 inches of straw neatly fastened on the outside, and with the eaves of the roof projecting far enough to keep that straw dry, will be the best substitute for a double wall; and if the ears of wheat are removed, so as not to entice birds or mice, the straw will last a number of years.

Thus by using hollow walls, or a non-conducting medium, it will be seen that regular ice houses may be as well partly or wholly above ground as below it; and in the circumstances of soils retentive of moisture, much better above than below. When so built, and near the mansion, they could be turned to many useful purposes as respects keeping meat and vegetables with more economy as to ice than when the ice has to be brought in pails and barrowloads to the house.

So much for the place: now for the filling. The chief thing is to get ice from good clear water, and pound it well outside, but chiefly inside, of the house. If the water is not clean the ice will be unfit for preserving many things where fine flavour is an extra consideration. Every space of air enclosed between pieces of ice will hasten the decay of the ice whenever these spaces can gain access to the air above them. When filling in frosty weather it is a good plan to use a little water for filling up the crevices, which soon freezes the whole into a compact mass. All ice with leaves and pieces of wood in it is to be rejected if better can be had, as they will make a sort of free space round themselves long before the summer is past. In packing it is advisable to keep the centre the lowest, and the outsides the highest, so that the moisture contained may find its way to the centre and there be frozen, instead of passing through the ice at the outside and escaping. This same rule should also be attended to in taking the ice out of the ice house. It is impossible to break the ice too fine—the more like sleet and snow the better, and the firmer packed the better. This is even more necessary when the house for keeping it is small.

However built, the sides must not be too steep, or the coverings will not be easily kept on. When finished as firmly on the sides as possible, it is advisable to wait for a frosty night before covering it; and if that should not come a good shower will do it good, as it will make the outside a dense sheet of ice.

Snow rolled in heaps when well consolidated, and a little water used to enable the workmen to compress it, is little inferior to ice, either for ice wells or ice heaps. When a good fall takes place, and there is an open park to go to, it is easy to get a great quantity of it when fresh fallen, or when there is a slight thaw. When hardened, however, a little on the surface with frost or wet, it is vain to attempt to roll it into heaps.

The heap being made and finished, the next thing is to cover it up securely. A layer of 3 inches or so of clean wheat straw should be placed all over it. After that, when possible, the covering next the straw should be of an open nature, and the very outside rather of a close nature. Provided the outside air does not penetrate, the more air enclosed between the outside covering and the ice the better it will keep. Thus, after the straw, we have seen 9 inches of rough stubble put on, and the outside formed of 9 inches of tree leaves. Again, we have known small spruce or larch faggots used above the straw for a foot in depth, and then a thatching of straw from 9 to 12 inches thick, and both answered well. Where tree leaves

can easily be obtained, I would prefer 3 or 4 inches of clean straw, and then 6 inches of leaves at first, increasing the amount gradually to 12 or 18 inches of leaves, according to the heat of the summer. When these are once settled it takes a very strong wind to dislodge them, and if the sides are moderately steep rain passes freely down the outside without penetrating to any extent. If the above amount of leaves were put on at once, they might be liable to heat. Vermine rather dislike burrowing in the tree leaves. Any other substance will do, provided the same conditions are observed.

One thing we must guard against, as a cause of failure. Some people, extra careful, put a rough frame over their ice, and the covering over it. I never saw one case in which such a mode answered well. When the ice sinks the frame does not sink with it, vacancies are formed between the ice and the coverings; these get filled with moist vapour and melt the ice, or sometimes holes are also formed in the covering, by which the warm air outside has free entrance to the heap. By placing the covering at once on the ice, the covering sinks as the ice sinks, and no space is given for damp vapours, nor yet much chance for any openings being formed. At any rate, I have never seen these kindly-intentioned rough frames used but disappointment more or less was the result. It would be better to construct a wood house at once, and have an air-tube in the roof and doorway. In heaps nothing should come between the ice and the covering.

One word more. When ice has to be taken to the mansion for various purposes, the preserving of it as long as possible is a matter of some importance. Ice tubs are, therefore, very useful for the superintendent of the kitchen or the cellar. They may be made of any size or shape. We have a very useful circular one near the cellar, 3 feet in diameter at bottom outside measure, 30 inches in diameter at top, and 3 feet in height. The bottom is formed of wood some 4 inches thick, the sides of the same 3 inches thick, lined inside with cork 1 inch thick. It is supplied with two lids, one thick, and similarly lined, that fits into a groove, so as to be on a level with the circular outside; the other to go over that, and come down a couple of inches over the outside. It used also to be lined with woollen cloth, but that seemed to be of little consequence. It is painted outside of whitish colour. There is a small iron vessel fixed inside that would hold somewhere about two gallons of water; and, there being a pipe from it communicating with a tap outside, there is always a ready command of ice water during the summer. Bottles of wine, &c., are merely placed among the ice. Though this tub stands in an airy place, the ice keeps a good while if the lid is not often opened.

AMERICAN BLIGHT ON APPLE TREES.

My employer, John McInnes, Esq., having bought Heath Bank two years ago, we found the Apple trees in a sad state, literally white all over with American blight. We were at a loss to know what to do with them; we tried spirits of petroleum, which killed the pest at once. The petroleum is applied with a painter's brush to the part of the tree that is affected with the blight; it may be applied to the whole of the tree without injuring it in the least, as it evaporates soon after being put on. After getting rid of the American blight we cut out all the cankered wood, and this year the trees have made new clean wood full of fruit buds, and no bug to be seen. I think the adoption of this remedy would be a great saving in nurseries, where I have seen hundreds of young trees with the bug on them. I think train oil is very injurious to any tree, though I have seen it recommended in a previous Journal. The petroleum has been tried by several gardeners here with the same result. We have a Louise Bonne Pear on a wall covered with scale. I intend trying the petroleum on this tree in the spring, and will let you know the result.—I. POWELL.

MESSRS. SUTTON'S STAND AT THE SMITHFIELD CLUB CATTLE SHOW.—The principal contributors to the stand of Sutton and Sons are:—Her Majesty the Queen; H.R.H. the Prince of Wales; Lord A. Hill; Lord James Butler; the Earl of Warwick; Lord Bridport; Lord Calthorpe; Admiral Sir G. N. B. Middleton; Sir H. Dashwood; Sir Paul Hunter; John Walter, Esq., M.P., and Professor Buckman. The roots exhibited are those to which were awarded the principal prizes at the Royal Berkshire Root Show, 1874, and include specimens of Sutton's Mammoth Long Red Mangel, weighing upwards of 40 lbs. each, and to which has been awarded the first prizes at the Birmingham Show for the past six years, those grown by Sir G. N. B.

Middleton being especially noteworthy. Sutton's Berkshire Prize Yellow Globe Mangel weighs 35 lbs. each, grown by Mr. Jas. Messenger, Alton, and some of the same variety grown on the Earl of Warwick's estate, Heathcote Farm, Warwick, which produced the extraordinary crop of 84 tons per acre, the heaviest ever known. Sutton's New Golden Tankard Yellow-fleshed Mangel grown by R. W. Hall Dare, Esq., weigh 28 lbs. each. This variety produces more saccharine matter than any other, and Messrs. Sutton were awarded the gold medal of the Highland Society for its introduction. Sutton's Improved Champion Swede, some weighing 18 lbs. each, grown by J. F. Burrell, Esq., This Swede has since its introduction been awarded no less than £2800 in prizes. Sutton's Yellow Intermediate Mangel, a variety especially suitable for shallow soils, weighing 30 lbs. each. Sutton's Imperial Green Globe, and Sutton's Purple-topped Mammoth Turnips, two varieties originated by Messrs. Sutton some few years since, and valuable for main crop and late feeding. Grass seeds for all soils are represented; also seed Potatoes and a very interesting collection of all the principal kinds, including Sutton's Red Skin Flourball, and Sutton's Hundredfold Fluke.

MR. PEARSON'S GERANIUMS IN 1874.

In giving my estimate of the different Geraniums we have used for the embellishment of the flower garden during the last summer, I will first take the Scarlet section.

Among our old favourites we have nothing that has stood the weather better than Douglas Pearson. It began to bloom as soon as it was placed in its position on the flower beds, and throughout the season it was a glorious sheet of bloom. It is a very fine dark crimson, with large trusses, free bloomer, and very dwarf and compact. Bayard has maintained its previous good character. Wm. Thompson is much of the same colour, a Hybrid Nosegay; is rather stronger-growing than the two preceding; just suited for the back row in a ribbon border or for massing in large beds. Mr. Loase, of Mansfield Woodhouse, considers it the most free-blooming and the most effective Geranium of the older varieties. Mrs. Mellows and the Duke of Devonshire of the same section have also been good. Coming to such as have not been so long in commerce among the orange scarlets the greatest favourite is Corsair, and there is no doubt but it will remain a popular variety for years to come. In some notes I contributed to "our Journal" last year I spoke in high terms respecting this Geranium, and this season it has more than justified all I have previously said in its favour. It is, without exception, the best Geranium in its class of colour that has been introduced for flower-garden decoration, and it is equally valuable when grown in pots. At Hardwick Hall, the residence of the Marquis of Hartington, Corsair stood pre-eminent. Mr. Wilson, the highly-respected head gardener, considers it an invaluable adjunct to the flower garden. During the summer of 1873 I was much in favour of the Rev. T. F. Fenn, but the last summer it has scarcely been so good. One bed of it was all that could be wished in the early part of the summer, but the latter part of the season the flowers were lost too much among the foliage; however, I have propagated it extensively, and shall give it a trial another year. Shakespeare has been good; the flowers are borne on stout footstalks, and the habit of the plant is dwarf and compact.

Of pinks, Amaranth is greatly admired for its singular colour and fine truss; and Mrs. Holden, not possessing such a deep shade of lilac, has also immense trusses which stand both sun and rain. Through June and the early part of July we were hardly satisfied with Amaranth, but many of our plants had been raised from cuttings in March and April, and were only small ones at the end of May. This confirms what your correspondent the Rev. C. P. Peach so repeatedly advocates—that of planting strong plants in the spring. When they had made a little growth and became established they bloomed with the utmost freedom, and more than realised our most sanguine expectations. When we removed them from the beds the last week in October it was with great reluctance, so fine were the remaining trusses of bloom and so grand the colour.

We have discarded all our old pink varieties, such as Christine, Maid of Kent, &c., to make way for Amaranth and Mrs. Holden. There are other shades of pink all good and useful, especially Mrs. Flytch, Mrs. Musters, Mrs. Tait, Florence Durand, &c., but Amaranth and Mrs. Holden take the precedence with us. Mrs. Young, Contessa Quarto, and also Mrs. Musters, are pre-eminent for conservatory decoration.

Passing by many other valuable varieties I come to the seedlings of 1872 which were sent out early in the present

year. Anyone possessing that batch might consider themselves fortunate, for they are a great advance on any of their predecessors. We have not tried them in the flower garden, as we only bought one plant of a sort, but we can bear testimony in favour of their good qualities for indoor work. Mrs. Turner is remarkable for the immense size of its truss; and Lady Emily Pierepont, a beautiful delicate shade of pink, is the sweetest thing that Mr. Pearson has yet sent out. Cruger has fine-shaped flowers, a glowing scarlet suffused with pink—quite a model of perfection. Miss Maud Holden, rich brilliant scarlet, and John Watson, fiery crimson, the individual flowers being 2 inches across. Then among the various shades of pink, scarlet, crimson, and rose I may mention Mrs. Gibbons, an improvement on Amaranth; Col. Wright, fine habit; Laura Walter; H. R. Clifton, large bold truss; Caxton; Arthur Rogers; Lucy, bright rosy pink, quite a gem; Sibylla, immense trusses; Nelly May, salmon shaded with scarlet; and Miss Blanche Storey, delicate pink with a light eye. These are all of sterling worth.

I made a hasty visit to Chilwell on the 27th of October. Although it was so late in the season I not only saw in a large span-roofed house the best of previous years, but the house was more than half-filled with seedlings raised in 1873, to be sent out early next year. Many who have seen these Geraniums have loudly set forth their praises as decorative plants; not only in the summer and autumn, but in suitable houses they will continue to bloom profusely on to midwinter. When I saw this house on the above date it was quite as gay as when I have seen it in previous years during the bright days of August, and in a note from Mr. Pearson on the 2nd of December, he stated it was then as bright as ever. All the new varieties were conspicuous for much larger and bolder trusses, and the individual flowers were more round and perfect, such as would pass through the ordeal of a florist's examination. How they will answer as bedding plants time will prove, but from the compact habit of many of the plants, and the strength of the footstalks and the substance of the petals, they cannot fail to be valuable additions to the flower garden. I will mention a few.

Mrs. T. F. Fenn, much of the habit and colour of Amaranth, a more intense lilac pink, and the individual trusses larger, with plain green leaves. Ethel, a slight zone in the leaf, large lilac flowers. Annie Orton, of the same colour but a darker shade, very much like Amaranth, far surpassing it in all respects. Lucy Bosworth, Lady Byron, and Mrs. Rogers may be classed together as bright rose pinks with light eye, and in our note-book we have put them down as the greatest march out. Charles Smith and Sir H. S. Stanhope are dark crimsons, the darkest I have ever seen, possessing immense trusses. Douglas Pearson, an old favourite, falls into utter insignificance by their side. Mrs. Whiteby, scarlet with white eye, pretty zone, dwarf and compact habit. Mrs. Leacroft, orange red with a white eye, a very distinct variety. Earl Manners, fine dark crimson with light eye, firm leathery petals, is very good; also Dora Charlton, Laura and Archibald Henderson may be classed with Earl Manners for colour. Lady Stanhope, red orange—Mr. Pearson guarantees this to be the finest bedding variety he has yet raised. Mulberry, dark plum colour, a Nosegay of a superior type. Mrs. Jacoby, fine bold truss, colour a mixture of salmon, pink, and rose, which baffles our ingenuity to describe. John Gibbons, habit of old Tom Thumb, dark scarlet, fine bold truss, flowers of immense size; one of the largest Mr. Pearson has yet raised. It is likely to be much sought after for exhibition purposes. Rev. F. Atkinson, rather a darker shade of scarlet than the preceding, trusses very large. Ellen and Miss Strachan, fine salmon, a great advance on this shade of colour, flowers very perfect. Miss Louise Smith, purple rose with massive firm petals of wonderful substance; very fine. Mrs. Joseph Paget, beautiful rose, of satiny texture, fine truss, and good habit. Mabel Eden, purple rose, some shades deeper than Mr. Pearson's Rose Bradwardine. John Fellows, rosy crimson, bids fair to be a first-rate bedder.

Those who think new seedling fruits and flowers come almost by chance, have little idea of the expenditure of trouble and cash Mr. Pearson's seedlings have cost him. Visitors to the Chilwell Nurseries have seen the thousands of Geraniums raised each season from seed, but very few have any idea that every one of these was raised from a flower crossed by his own hands, for no one is ever allowed to interfere with this his favourite pursuit. I have heard him say that if obliged to leave home for a day, he cuts off every bud that is likely to

bloom in his absence. I think the Chilwell Geraniums prove that a determination to keep none but really good things must pay in the end, for some years since I think that only two flowers were kept and named out of six thousand seedlings, and now so much is the breed improved that the kinds I have named were all raised in one year. Years ago many thought there was no further room for improvement in Zonal Geraniums, but who when admiring the Maid of Kent could so soon anticipate a Lady Emily which was sent out last spring, or a Lady Byron which has to be sent out next year?—QUINTIN READ, *Pleasley Vale Gardens, Mansfield.*

GARDEN LABELS.

I THINK with your correspondent, that a cheap and excellent label might readily be manufactured of white porcelain with the lettering burnt-in. Plants in pots are usually sent out from nurseries with a wooden tally, on which is either a number or the name of the plant, too often indistinctly written. The adoption of "AMATEUR'S" suggestion would be a real boon to the horticultural world, and it is a matter for surprise that it has not been carried out long since.—SUBSCRIBER.

I WOULD recommend the following method of preparing labels for plants:—Cut pieces of zinc to the size and shape required, stamp the holes, paint them white, when perfectly dry write with a blacklead pencil. Of course the better the writing the more elegant they will look. But I prefer wood to zinc, as I have seen the paint come badly off the zinc with the heat of the sun, &c. The wood can be cut to any size, or shape also. Paint them white, when dry write with blacklead pencil, then varnish. If this is properly done they will keep beautifully for many years in either hothouse or garden.—WILLIAM LAURIE, *Gardener, Lynnwood, Stirling.*

THE most legible mode is to print the names so that they can easily be read without having to step on the beds or border. But now comes the query, What are they to be done with that will last and stand the weather? We want something that is lasting but clear, and can be plainly seen at a passing glance, and that I am afraid is out of our capacity, unless we apply to the crockery manufacturer or some sort of enamelling. But we must not despair if there is any reliance to be placed in what I have now before me, and that is a scrap out of a Boston journal, the substance of which is as follows:—For zinc labels take of verdigris and sal ammoniac two drachms, lampblack one drachm, water 4 ozs., to be well mixed in a mortar, adding the water gradually. It must be kept in a glass-stoppered vial. Write with a quill pen on the zinc with the ink, after shaking it well, and after it is dry you may expose it to the weather or bury it in the ground for years, and it will be as legible as when first written.—THOMAS SHEASBY, *Hare Hill Gardens, Macclesfield.*

I USE labels made of glass, and write the name of the plants upon them with a diamond, or they can be written upon with a blacklead pencil when they are required for flower seeds or for one season only. For espaliers or wall trees I drill a hole through one end of the labels, so as to suspend them with copper wire, or nail them to a wall with copper nails. If nails are used they should not fit the holes too tight, nor should they be driven quite home, so as to allow the glass to expand a little when warm. Made plain without holes the cost per label would not exceed 1d. each; with holes about 2d. each. Small labels could be made for pot plants at about 6d. per dozen.—ANOTHER AMATEUR.

[Our correspondent has sent us specimens of all the kinds, and they are the most attractive we have ever seen. They are more than one-eighth of an inch thick, and being of frosted glass they can be written on with a blacklead pencil, and the writing easily washed off and renewed or changed.—EDS.]

I THINK if "AN AMATEUR, *Fifeshire*," will try five grains chloride of platinum, dissolved in 1 oz. of distilled water, and write with it upon zinc labels first rubbed with emery paper, he will have one of the best and most enduring labels. I have known these labels buried more than two years, and found the writing perfectly legible.—W. B. H.

[Of zinc labels the best forms that we have seen are those prepared by Mr. Yeast, Mortlake, Surrey; they also have the

merit of being very cheap. They are substantial, and give plenty of space for writing.—EDS.]

LIFTING AND ROOT-PRUNING FRUIT TREES.

No. 6.

PEACH, Nectarine, and Apricot trees, as also the Plum, which are all upon the Plum stock, are often when young very free in growth, making long sappy shoots which do not ripen well, though sufficiently so for continued growth, but not for the formation of fruit-buds, and the trees are consequently for some years unfruitful. I had some of all three kinds planted four years ago this autumn, and one-year trained, which in three seasons' growth covered on walls a space of 9 feet high by 10 feet width, one Apricot tree outstripping all others, having in three years occupied a space of 12 feet by 16 feet. These trees are in a free, open, rich, light soil. I have others in a stronger and firmer soil, which from the time of planting, also four years ago, have made much shorter-jointed firmer wood, ripening perfectly, and producing fruit from the second year, whilst the others have fruited but little. The trees in the heavier and firm soil have not grown more than two-thirds the extent of the trees in the freer soil, and the fruit produced is not compensating, as they are not better furnished with bloom-buds for their size than are the others one-third larger. Both are plentifully furnished with them, and next year the larger trees will afford—I am guided now by experience—one-third more fruit than the smaller trees, and make up at once for the want of bearing in the preceding two years. They will in seven years from planting cover the whole of their allotted space, and will be made to fruit right away now, whilst the others will not have covered theirs under ten years, probably a dozen.

I know it is not considered good practice to manure trees at planting and encourage growth by a rich soil, as it tends to make them unfruitful and unhealthy. This is unquestionably true of the Apple, Pear, and Cherry on the free stock; they grow quite freely enough without a rich soil—even become gross when the soil is heavily manured at planting, but for trees on the dwarfing but free-rooting stock, whether they be Apple, Pear, Cherry, Plum, Apricot, Peach, or Nectarine, a good dressing of manure thoroughly incorporated with the soil is the best thing that can be done to give them a start. It seems to me strange for a tree to be pinched for support whilst it is young, the object being to get it to fruit at an early age; but I cannot admit that a young fruit tree furnished into maturity when it is young will have other than small sap vessels, nor that it will be as capable of transmitting through its stunted growth as good a supply of food as a tree that in youth has grown freely, or be nearly so healthy.

It is admitted that Vines fruited heavily in the early years of their growth do not give such good after-results as those which are very sparingly cropped the first two and three or more years. The early and heavy-cropped are so enfeebled as to be of little value for some years; they seldom if ever recover so as to equal in result those which during the first two, three, or more years were allowed to make headway and obtain a firm grip of the soil before they are permitted to bear a full crop; in fact, if they are allowed to carry a full crop the first year it is advisable to throw them away. It is also granted that the fruiting size of Vines is not so good for permanent planting as those which have been grown a shorter time in pots, and have not such stout, short-jointed wood, and the eyes very prominent—have neither the roots so cramped nor stimulated by high feeding producing wood in a season as thick as a finger in degrees of thickness from the fore to the little, and eyes like nuts. It is known that the fruiting canes are not so good for planting as the moderate-sized ones; they may produce greater results for a time, but in the end are not so serviceable as those planted of less size. Even within the past few years the practice of growing them in pots at all for planting permanently has been departed from by no less an authority than Mr. W. Thomson, the young Vines being raised in beds and so planted in their permanent position with their roots originating directly from the root-stem instead of being made to form every conceivable angle and curve around the inside of a pot, which the planter tries to straighten at planting.

If early-bearing—growth which results in fruitfulness, and in Vines results in after-enfeeblement—is it not equally applicable to other fruit trees? I think it is; and yet whilst we have to guard against a system which by starving or a firm

soil induces fruitfulness by staying the growth, we have to guard against the opposite extreme of grossness—rank unripe growth. The shoot of a Peach, Nectarine, Apricot, or Plum may grow as thick as the little finger, and six or more feet long in a season, and yet be healthy. A shoot may start away strongly, and before it has grown a foot give evidence of grossness and ill-health. Such shoot left to mature will have the appearance shown in *fig. 146*. At its base, for a foot distance or more, will be formed wood, triple buds, and single fruit

Fig. 146.

buds, as shown from *a* to *b*; but after it has grown that extent it will put out laterals, and, if very gross, at every joint, and at a considerable distance apart—often 3 to 4 inches. These laterals are of two kinds. One has buds at its base *c*, and these buds are as good, so far as growth is concerned, as the buds from *a* to *b*, the shoot being cut off at the bar *d*; but if the shoot or lateral be left it will form, after it has grown 6 inches or so without a leaf, have along it single wood or fruit buds, or it may put out sub-laterals as at *e*, becoming as the head of a tree in miniature, yet not small either. A shoot as *e* is of no use, as it has no eyes at its base, nor have *f*; and as we have four of those, which may be 4 inches apart, we have 16 inches of branch without means of originating side shoots (except those existing), and bearing wood at a proper distance apart.

It would be folly to give rise by richness of soil to wood as above described. It is the surest road to the formation of an ugly tree if such growth be not restrained, and, as it will appear sometimes, the best remedy is at once, when the trees are making growth, to cut back to *b* (*fig. 146*), which will result in either a cessation of growth for the season in that part of the tree, the sap being appropriated by the other and weaker parts, or cause a shoot to arise from the wood below *b*, and this trained-in in the place of that cut away, any other shoots arising on the same branch being cut-in close. The laterals, as before stated, having eyes at their origin to be cut as *c*, and there is in such a case no necessity to head-back the shoot either in summer or at the winter pruning; for it is a murderous practice to cut back the shoots of the year half that they have grown, and should be practised only to originate shoots for furnishing the tree duly with branches. The wood above described is common to the Peach and Nectarine in a young state and when very vigorous, but is more frequent in trees on walls in a rich open soil and where the climate is cold, and being produced late in the season the wood does not ripen. Under glass it does not so much matter, as the strong shoots can be shortened with a prospect of the growths resulting being ripened; whereas outdoor growths, such as the one

described, are not so easily subdued, and are best avoided, as they may for the most part be, by using a moderately firm soil, which causes slow feeding, slow growth, and stont short-jointed wood.

Though extreme richness in soil is bad, a poor soil is equally disastrous. Gum and canker are a consequence in the former when it is sought to restrain growth by the knife; weakness with dying-off of the branches the result of the latter, with miserably small fruit. A good rich soil is what I prefer to plant in; and if the trees grow too strongly, making sappy growths which do not ripen, by resorting to lifting it may at any time be restrained. The object of a rich soil at planting is to get the trees to cover as much space as possible in a short time; for the fruitfulness of all the subjects on the Plum stock after moving, is one of the most marked results of lifting known. The soil can hardly be too rich if it is firm; and if the trees grow too vigorously, or they are wanted to fruit, lift. It does not matter if the Peaches and Nectarines produce in a season shoots 4 feet long, Apricots those of 5 feet, Plums of 6 feet; the Apricots and Plums by lifting will the following year be studded from end to end with fruit-buds, and the Peaches will give short stiff shoots masses of fertility. I do not, however, advise that Peach trees should have so rich a soil as for Plums and Apricots, but if it is rich it must be made firmer than for the others, so as to lessen the tendency to produce laterals. So long as the trees do not produce laterals it does not signify how long and strong the shoots which are to form the branches are. The bearing shoots which are only of annual duration, growing one year and fruiting the next, then giving place to others, require to be stiff and short-jointed, stopping them at the length during growth to which they are usually shortened at the winter pruning. What we want of Peaches is vigorous main branches, with shoots along them for bearing at about a foot apart, but Apricots and Plums we want studded with spurs throughout.

For the first three years I do not consider we can calculate upon much of a crop from the trees named, they not being furnished with shoots and branches for bearing, but requiring them. We can hardly have them in less time, but we may obtain trees two or three years trained, and in a bearing state, which are very different to young trees, being, perhaps, equal to trees that have been grown three years, but they will not do so well, though they have fruit buds to begin with, for a year will be required to establish them, and very often another to get them into proper order for carrying a crop. Trees in a bearing state are very good if you have them on the spot, and can move them with a mass of soil as well as roots; but if they have to come from a distance, the tree with plenty of growing wood is infinitely better than one with many fruit buds. They take about as long to establish as it takes to grow a tree one-year trained into a bearing state, and are fit only for burning when they have not been frequently lifted.—G. ABBEY.

ELECTION OF FRUIT TREES.

I WRITE briefly to say how valuable I think the proposal made in a late number of your Journal, that the recent interesting and useful election of Roses should be followed up by having elections of other things in the gardening world. Within the last fifteen years I find I have planted upwards of 350 different kinds of Apple, Pear, and Plum trees selected from various catalogues, &c. After trial I am now sensible that I have lost much time and planted many useless trees. I have had to prove all these trees for myself, and have had much trouble in regrafting the inferior kinds. I believe I could comprise in a list of forty or fifty every tree among the lot that is worth growing in this locality. Such an election would save many others from making the mistake I did, and from being at the trouble and expense of proving the trees for themselves. For myself I am tired of experimenting with unknown trees. I seldom now ever buy a tree. I graft for myself only those kinds that I have found to be good. The results of such an election would enable me, however, to discover if there were any good bearing kinds both as to quantity and quality which I did not possess.

In conducting such an election of fruit trees I should think it would be necessary to divide it into two parts; or rather have two elections, one for the south and middle of England, and one for the north of England and Scotland. It probably would be necessary also to take votes as to wall trees and standard trees, and as to dessert and kitchen fruits respectively.

Then such elections might be afterwards carried out as to

other fruits, such as Cherries, Peaches, Grapes, Gooseberries, Strawberries, &c., also as to certain shrubs and flowers, such as Rhododendrons, Hollyhocks, Dahlias, &c.

It might be difficult and perhaps presumptuous for any private individual to carry out such elections at his own hands, but if the Editors of your periodical could undertake it, or could name parties suitable for the duty, and thereafter publish the results in your columns, it would prove both interesting and useful to your numerous readers.—AN AMATEUR, *Fifeshire*.

[Another correspondent, "C. T. H.," urges an election of Apple trees. We cannot undertake to arrange returns from the fruit-growers of our islands, but if anyone will undertake the task we will aid him in every way within our power. Will our correspondent oblige us by a list of the fruits he has elected for *Fifeshire*?—EDS.]

A REMARKABLE COLLECTION OF NEW CROSS-BRED GRAPES.

It was the writer's fortune this fall to examine a collection of new hybrid Grapes, of such remarkable characteristics and superior excellence, that one may be justified in calling it the choicest now extant in America.

Ten years since Mr. James H. Ricketts, of Newburgh, New York, owning a little cottage and garden on the hillside in the city, with practical love of horticulture, in the leisure moments spared from his business occupation began the study and experiment of hybridising Grapes, both native with foreign, and foreign with each other, and testing their seedlings in the open air. If there were any place more unfavourable for such a test we have never seen it. In the summer time with exposure to intense heat; in the winter to severe cold, with ground poor, and sloping to the north-east, it seemed as if any Vine that succeeded here ought in all fairness to do well in the average climate of the United States. His experiments have yearly grown in interest, and the fame of some of his successes have already been known to some of the most observant horticulturists; still it has remained to the trials of the present fall to give a reliable verdict. His methods of hybridising are of course known only to himself, but all kinds of experiments have been tried, the pollen sometimes being kept till two or three weeks old, and then applied. Again, the caps have been taken off four days in advance of the time usually taken by nature. One other person in Canada, pursuing his trials, studies, and experiments in almost the same track, has yet made a complete failure in every case, and where the secret of Mr. Ricketts' success can be doth not yet appear. It is sufficient only to judge of the results as we now find them. Mr. Ricketts' collection may be divided into three classes:—1, Black Grapes. 2, White Grapes. 3, Wine Grapes. There are now seventy-five seedlings in all growing in his garden, and of them all, we may truthfully say not one is an inferior variety. A large portion of these Vines are but two years old, some three to four, while but few are older. Still, the sorts which exhibit most marked excellence are the older varieties, and the newer ones develop traits more valuable with each year of increasing age. About one-quarter of the collection may be classed fully as hardy as the Concord, and the rest not yet fully determined, although they have been largely exposed to the winter for the past two years without suffering injury.

The Secretary is a large, beautiful, black Grape, which has already become known. It originated with Mr. Ricketts in 1867. The original Vine fruited the next year after the seed was planted. It is a seedling from the Clinton and Muscat Hamburg. A large Vine is trained upon a trellis near Mr. Ricketts' house, and some of the bunches were nearly a foot long and well shouldered; the flavour is excellent, sweet, vinous; bunch hangs well, berry firm. Good market sort.

It is a little curious to note here the following incident: Mr. Ricketts taking one day to Charles Downing seven of his seedlings, and requesting an opinion, was surprised and delighted to find him class five of them as better in flavour than the Muscat Hamburg itself. An opinion from so high a source gives decided character to the value of the collection.

The finest white Grape of the collection is No. 93, A. Imperial, a white seedling from Iona and Sarbelle Muscat. The berry is very large, of a fine white colour, with considerable bloom; bunch quite large, regular, with slight shoulder; no pulp, no seeds, splendid flavour, with traces of the Iona Muscat aroma. Vine exceedingly vigorous grower; ripens about

the time of the Isabella; oldest plant is now four years. Mr. Ricketts has given me the pleasure of bestowing upon it a becoming name, which in honour of its superior merit I now name "The Imperial," for it seems thus far to be the best White outdoor Grape yet originated. Perhaps its most valuable feature is its hardiness; standing the winter well when Concord was killed.

No. 207, H.—White Grape, slightly yellow, quite sweet, thick pulp, bunch nearly as large as the Catawba. A seedling from Concord and Allen. Vine now two years from seed, and bearing this season five bunches; fully as productive as the Rebecca. From the same origin came other seedlings, all of uniform excellence.

No. 72 B.—A seedling from Hartford Prolific. Black, rich, red pulp, musky flavour, sweet, pulp small, very productive; ripens between the Concord and Isabella.

Don Juan.—A very large bunch, amber berry. Parents, Jena and General Marmonica; very hardy, ripens with Isabella, vinous, but not very sweet, bears a few very large bunches.

No. 37.—Vine is four years old; bears forty bunches this season; extra large berry; a seedling from Concord and Jury Muscat, exceedingly productive, a good market Grape, carries well, berry firm, soft pulp, flavour fair, not sweet. A very strong-growing sort.

No. 176.—Dark amber colour, six weeks earlier than Iona, flavour sweet and richer than Iona. A seedling from Delaware, but has more life and spirit than its parent; in size of bunch also superior.

Clinton Seedling, No. 6.—Foliage wonderfully hardy, thick pulp, slightly acid, but exhibits strong vinous quality, and in the wine-scale test it ranks ahead of the Delaware; immensely productive.

No. 186.—White, seedling from Clinton, considered a good wine Grape, large berry.

No. 207, B.—A capital eating Grape, white, sweet, very hardy, extra stout canes, beautiful coloured fruit, bunch moderate size, loose but well shouldered.

No. 12, B.—Black, bunch extra large, 1 foot long, one shoot often bearing three bunches, strong canes, wonderfully hardy, moderately sweet and vinous, thick pulp. Consider it an extra good variety; the sweetest grown in the collection.

No. 12, A.—Has more juice, less pulp, and really more enjoyable as a family Grape.

Adelaide.—Black, sweet, vinous, strong, heavy foliage, thick leaf, as large a berry as the Union Village, good bunch, very productive.

Ricketts' No. 1.—Plump berry, very large, long bunch, very firm, keeps growing till cut off, not a sweet flavour, still not acid.

No. 157, D.—White, seedling from Concord, earlier than the Hartford by ten days to two weeks, thin skin, large berry, round bunch, sweet flavour, juicy, wood like the Concord, very hardy.

No. 157, A.—A brother of 157, D.—very late.

No. 158, B.—Black, transparent, loose bunch, large, excellent flavour, juicy, quite as good as Senasqua.

No. 14.—White, seedling from Isabella and White Tokay, ripens with Isabella, largest of all the white varieties; hangs firmly, both bunch and berry firm, tough skin, quite sweet, bunches extra large, some will weigh nearly 2 lbs.; really a first-class variety.

Quassaic.—Black, very regular bunch, a seedling from Clinton and Muscat Hamburg; novel flavour; a trace of the Clinton, but more pleasant; no more acid than is agreeable; its fine looks and its firmness are its best characteristics. One of the prettiest Vines ever seen, filled with large bunches; one Vine has grown as much as 25 feet from a young plant in a year.

Concord, No. 1.—Enormous berries, each a mouthful, flavour moderately vinous and sweet; when well ripened quite pleasant; large, well-shouldered bunches, moderately productive.

Raritan.—An accidental seedling; best wine Grape in the world; was tested with thirty and forty others, including Delaware and Walter, and ranked 112; The Walter marked 3½ per cent. acid; Raritan marked six per cent. No European variety has ever ranked as high in the wine scale as this.

No. 10.—Very good flavour, juicy, large plump berry, hangs on firmly, tough skin; seedling from Hartford and Purple Damascus.

Advance.—A natural wine Grape; the only wine Grape which has a natural effervescence; a good eating Grape, very

regular bunch, large berries, black, tremendously vigorous, hardy, and astonishingly productive; a first-class Vine.

In view of the fact that the Iona does not succeed here, and the Diana has to be plucked off, so as to leave but one bunch to a shoot to ripen well, it seems as if Vines like those described above, with such excellent flavour and vigorous characteristics, must be destined to a celebrity of more enduring character than the average of new American varieties. From our own personal examination we can honestly state not one of all the white sorts exhibits a favour as inferior as the Martha, and they are uniformly larger in berry and bunch. Neither was any white variety less pleasant than the Croton in flavour, and but one possessed a slight musky perfume of the black Grape; neither was inferior to Concord, although many not so sweet; while even if no other sorts were deemed valuable as table Grapes, the acquisition alone of Raritan and Advance as wine Grapes would mark an era in the Grape history of the United States.

It is necessary to express all opinions with caution, for the history of horticulture in the United States has too many records of death-blows to enthusiasm over new fruits which fail when transferred to localities beyond the place of origin; yet, every active horticulturist will rejoice with pleasure at such signal advance in so new and promising an addition to the pomological treasures of the country. Mr. Ricketts' collection is a valuable one financially—\$10,000 would be a fair estimate of its worth, and we trust they will soon be disseminated and he will receive their full value.—HENRY T. WILLIAMS (in *The American Horticulturist*).

FLOWERS FOR OUR BORDERS.—No. 45.

ECHEVERIA RETUSA.—BLUNT-LEAVED ECHEVERIA.

In its general habit the *E. retusa* agrees with the other members of the genus, but the radical leaves are neither so regular in form nor arranged in so perfectly rosette-like a manner as in *secunda* and some others. When young they are acute, but become ultimately extremely blunt and irregularly scalloped or creuate, and bordered with brownish-purple.

The flower stem, which is also stained with purple, but of a brighter tint, grows from 1 foot to 18 inches high, the blossoms being produced at its summit in a dense, drooping, branched panicle, which becomes gradually more erect as the flowers develop themselves. These are externally of a rich crimson-scarlet colour, covered with a delicate bloom, and internally of an orange-yellow; they continue expanded some days before fading, and as strong plants will produce several flowering stems, a succession of blossoms is maintained for two or three months in winter, a season when flowers of much inferior interest to the *E. retusa* are generally highly valued.

Its cultivation is of the simplest character; sandy loam enriched with a little leaf mould, or even sandy loam by itself, if not of too sterile a nature, will be found sufficient for its requirements. It is hardly necessary to state that the pots should be well drained to one-third of their depth at least, for this is an indispensable condition to success in the treatment of succulents.

It may be more important to observe that the flowers of the *Echeveria retusa* being produced in winter, it will require more water at that period than those species which flower in summer and autumn. During its period of growth, which succeeds that of blossoming, it may also be kept in a moderately moist condition; but after this is completed, which will occur about the end of July, water should be withheld, and to facilitate the ripening process the plant may then be stationed out of doors in a sunny corner for a month or six weeks at least, but must be protected from rain, though slight showers will do no harm. This exposition will be but a poor imitation of the dry season of the tropics, but it will at any rate be more conducive to the production of flowers than a permanent occupation of the window. If the plant be then removed about the middle of September to the sitting-room, and cautiously watered, it will hardly fail, after the lapse of a few weeks, to throw up its flower stems.

Increase is easily effected either by the offsets, which may be severed and treated as cuttings, or by the stem leaves, which are readily detached, and will root freely if, after being dried for a day or two, they are pressed into a pot of sandy soil. The leaves of some of the species will throw out fibres from the back if simply laid on the soil, as in the case of the *Gloxinia* and other plants; and it is to be presumed that those of *retusa* will root in a similar manner. Flowering plants are, however, produced more speedily from offsets, and as these

are formed in some abundance, the leaves need only be employed when a considerable number of young plants is required; in either case they are best taken in spring or early summer, so that the whole of the warmest months of the year may be available for the rooting process.

As an element in the formation of the geometrical beds now becoming so popular in certain quarters, or for other outdoor uses, the *E. retusa* is less desirable than some other species, such as *secunda* and *secunda glauca*, *metallica*, and its hybrids, but as a winter bloomer either in the greenhouse or the window garden it deserves to be kept in view.

Fig. 147.—*Echeveria retusa*.

With one or two exceptions all *Echeverias* are natives of Mexico, from which country the *E. retusa* was introduced about thirty years since by the collector Hartweg, who transmitted seeds to the London Horticultural Society. The cauline leaves of all the species deserve a passing notice for the curious manner in which they are attached to the stem, the leaf adhering by its surface near the base, but so slightly as to be easily detached without any apparent injury to the entire if care be taken.—(W. Thompson's *English Flower Garden*, Revised by the Author.)

THE CEDAR OF LEBANON.

IN ANSWER to "A SCHOOLMASTER" we can only reply that he may employ as the Cedar's botanical name either *Abies Cedrus* or *Cedrus Libani*, for modern botanists use each of these designations, and if we went back to earlier writers we should have to quote names still further differing. We have also to warn our correspondent not to tell in his lecture that "its wood is the outside of our blacklead pencils," for that outside is wood of the Red Cedar, *Juniperus virginiana*.

We have many letters consequent of those upon "the oldest in England," and asking for such various fractions of information that we will answer them in a continuous narrative.

It is a superlative of all plants named in the Bible. It is called there "the tree of the Lord," a name, to whatever applied, which there signifies what is most excellent. It was assumed to be the first and grandest of the vegetable world, or, as Solomon's botanical knowledge is described, as included between the Cedar and the Esob, a Moss common on the walls of Jerusalem. Dr. Tristram, after visiting Mount Libanus, has written that "the wood of the mountain-grown Cedar of Lebanon is much closer in grain and darker in colour than

that of trees grown in England. It was used by David in building the king's house, and by Solomon very largely in the erection of the Temple, and of his own palace; in the latter in such abundance that part of it was called the House of the Forest of Lebanon. The trees were felled and shipped from Tripoli and Gebal (Jebeil) by the Phœnician artificers of his friend Hiram, King of Tyre: 'The men of Tyre and Sidon also brought to Joppa Cedar trees from Lebanon for the second temple.'—Ezra iii. 7. It was also employed by Herod for the roof of his temple, and of it is constructed the dome of the Church of the Sepulchre at Jerusalem at the present day. The men of Sidon were celebrated for their skill in carving Cedar, a pre-eminence they still retain.

"Besides the grove of Cedars near the Kadisha, celebrated and described by every traveller, there are many other groves,

clumps, and even whole tracts of Cedar forest scattered throughout Lebanon. As they are for the most part in the northern and most inaccessible districts, they have escaped the notice of most travellers. Several were discovered by ourselves, and some have been added since. At least nine distinct localities are now ascertained, some of them containing many thousand trees, and with an abundant succession of young saplings springing round them. But few, if any, of them can show any trees equal in size to those of the famous grove.

"The Cedar grows rapidly and lives long. Even in England there are trees not yet two hundred years old measuring 21 feet in girth, as at the seat of the Earl of Wemyss in Gloucestershire.

"Dr. Hooker calculates the age of the Cedars of the grove to be eight hundred years, from the rate of growth of the

Fig. 148.—THE CEDAR OF LEBANON.

Chelsea Cedars. From the rings in a branch one of the older trees might be 2500 years old; but this, he observes, is no doubt widely far from the mark. Still an immense antiquity must be assigned to some of them.

"The Cedar is not found in any other part of Palestine, not even on Hermon, the Anti-Lebanon, or the highest forests of Gilead. It extends, however, into Asia Minor, being plentiful on the Taurus range."

We have a list of sixteen travellers who have visited and counted the giants of Libanus, and they show their gradual extinction. Peter Bellon found twenty-eight in 1550, Maundrell sixteen in 1696, and Richardson seven in 1818. Maundrell found that the trunk of one was 36½ feet in girth, and its boughs covered a circle 111 feet in diameter. In 1720 the boughs of one extended over a circle of 132 feet diameter. One of the most recent visitors of those Cedars, Lord Lindsay, found one, the trunk of which, following the sinuosities of the bark, measured 63 feet in circumference. Lamartine and others believe these patriarchal trees to have lived in biblical times. They are sacred even in the estimation of the Arabs, and by the Christians of all sects resident in their vicinity. A festival called "The Feast of Cedars" is celebrated on the day of Transfiguration.

In the "Gentleman's Magazine" of 1779, a communication from Sir John Cullum, of Hardwicke House, near Bury St. Edmunds, gives details of the Cedars of celebrity in England, details which have been frequently quoted from without acknowledgment by more recent writers. In Essex we remember noble specimens at Faulkborne Hall, and there was of them a noble avenue at Toppinghoe Hall, planted in the time of the Stuarts, but felled for the sake of the timber in the present century. Two Cedars planted about 1683 by Sir Hans Sloane in the gardens of the Apothecaries at Chelsea were large and celebrated; but one, if not both, are now dead. In 1793 the trunk of the largest was 13 feet in girth all but half an inch.

In the Palace or Manor House of Enfield, Dr. Uvedale, who there kept his school, planted a Cedar about 1670. In 1793 its trunk was 12 feet in girth at 3 feet from the surface.

We have a letter from "a Bradfordian," relating to another ancient Cedar, from which letter we extract the following:—"Mr. G. Abbey wishes to know about one planted by Dr. Richardson, of Brierley Hall, near Bradford; I therefore forward an extract from the *Bradford Observer Budget*, in which I have marked what he wished to know.

"In front of Brierley Hall stands a majestic Cedar of Lebanon, which was sent as a seedling to Dr. Richardson by

his friend Sir Hans Sloane. Although within the last fifty years some of the large lower branches have been broken off by the heavy snows, this is, perhaps, the oldest and largest Cedar of Lebanon in the kingdom. Of late years the ungenial atmosphere has begun to tell seriously upon the dark evergreen foliage, but it is still a tree of mark among its fellows. The year in which it arrived as a young plant is not known, but it would be probably about the year 1705. At first the doctor kept it in his greenhouse, but observing that whatever strength it gained during summer was lost during the winter, he resolved to risk it outside, and there its noble and graceful form has stood ever since. The tree was measured in 1812, when at some distance from the ground the trunk measured 12 feet 8 inches in circumference. At a recent measurement we found the circumference to be 14 feet 8 inches. The height is about 18 yards. It deserves notice that the second hothouse erected in England was built for Dr. Richardson, and by the same workmen who erected the first at Oxford, near Liverpool."

We have the following relative to the Cedar mentioned by Mr. R. Hayward, at a place near London, where a large garden party was given:—"He saw it in the grounds at Belmont House, Mill Hill, near Hendon. It is now twelve years since that party was given, for I was the gardener there at the time and recollect seeing several gentlemen stepping the dimensions of this fine tree, probably Mr. Hayward was one of them. I took notes of its size while there, which I have just found in my scrap-book. I make it 38 yards in diameter, and about 60 feet in height. The trunk I did not measure, because its branches started out within a foot or so of the ground, and it could not be measured fairly. I know it is a fine tree and generally admired by everyone. At the time I was there it had lost many branches, and those remaining furnished the tree well, but they had to be propped up to keep them off the ground. I wrote to the present gardener for the measurement, which I hope he has sent to the Journal, as such a fine tree should not go unnoticed.—T. RECORD."

The present size differs rather from that which Mr. Record states, but this may be accounted for from the lapse of time. The gardener now there, Mr. T. Nunn, informs us that the Cedar's height is 68 feet; diameter of the circle of outspread branches 111 feet; girth of trunk at 1 foot from the ground 20 feet 2 inches, and at 4 feet 18 feet 6 inches.

NOTES ON VILLA AND SUBURBAN GARDENING.

Now that the leaf is off, and all necessary protection given to those things that it is intended to leave out all winter, the beds not occupied with plants should be trenched up roughly to allow the frost to penetrate and pulverise the soil. With regard to manure, it is not always advisable to add that at this time of the year, but leave it to be put on when the beds are turned up for the last time, as I contend that the soil should be frequently moved if the weather will allow; and again, the soil of many beds is quite rich enough to grow most of the ordinary bedding plants without adding manure oftener than once in three years, and then not that which is rough and strong, but is well decomposed material, and more after the nature of light rich mould.

At this time it may be as well to say that those beds filled up with evergreens or any other plants should always have the fresh soil and manure added in the spring while the beds are being prepared for their summer occupants. Failing to do this has been one strong reason for saying that summer bedding plants have not been found to thrive after being filled up for winter decoration.

No doubt, also, there is a drawback in not being able to turn the soil up, and the action of the weather, and other things of smaller importance operating against the well-being of both winter and summer plants; and as there are several plants, such as the different sorts of *Euonymus*, *Laurustinus*, *Box*, as well as many of the annuals used for spring bedding which root most vigorously during the time they are in the beds, and therefore exhaust the soil to such a degree that unless something fresh is added no summer bedding plant can be expected to thrive satisfactorily; therefore it is easily seen that where both winter and spring bedding is carried on, be it ever so small a way, a special preparation is necessary for summer work.

Give Rose buds a coating of manure. These are plants that will be benefited by a strong rich stimulant, and if laid on the surface of the ground now it acts as a protection, and can be dug in after the severest weather is over. Tea Roses or any other choice tender sorts had better be carefully lifted if their loss is apprehended, and place them in a sheltered corner where they can have a little protection. They may be planted again in good fresh soil about March, and may be expected to bloom well.

Plant Briars as soon as possible. Where it is intended to raise a few stocks by budding next season, choose those with

clear straight stems, with spreading fibrous roots if possible. Those with thick clubs to them seldom live to thrive long, and generally produce a quantity of suckers to everyone's annoyance. The recent heavy rains have indicated very plainly where there is imperfect drainage; and as it is not possible for plants even of the hardiest nature to thrive in a wet soil, see to adding more drains at once, and repair old ones. Where there is the chance make it a point to decide upon what planting there is to do or shrubs to remove, and do it at once. The benefit of this timely operation will be seen in next season's growth.

The weather which has of late precluded the possibility of giving all the attention that plants in frames require, having now become open, it will be the better if they are looked over and all dead leaves picked off. The surface of the soil should be stirred, and a search made for the little green caterpillar which many complain are eating holes in their *Geraniums* and other plants; they are difficult to find, being of the same colour as the leaf, and the best method of discovering them is to give the plant a good shaking over some white paper or run the hand up the under part of the leaf, and they will generally drop off. Water everything very carefully at this season; and all ordinary bedding stock will be best kept rather dry than otherwise, and at all times give air if the weather will admit of it with safety. In the greenhouse and conservatory the same rule of admitting air must be carried out, only as these places will contain good decorative plants, some of them in flower, a temperature of 45° must be kept up; and if there is necessity for a fire and to keep it up, open the top light 2 or 3 inches, and let out the impure air that is so likely to accumulate there after the house has been shut-up for some time.

The next month or six weeks will be a critical time for all such plants as an amateur is likely to grow, and the greatest care should be taken not to let them grow too fast; and in watering it will be an advantage if they can have the water applied in a tepid state. By such plants as *Camellias* in pots, or those planted out and just coming into flower, plenty of water will be needed, and about twice a-week tepid manure-water given; this will assist them to open their buds more freely and regularly.—THOMAS RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT GARDEN.

THE frost has become very severe—too hard, in fact, for digging, except where some rough litter was placed upon the ground previously. We had wheeled some manure on to the Raspberry quarter, intending to dig it in on the first opportunity, but the manure is so hard that it would not be at all desirable to dig it in at present. There has been much controversy amongst scientific men about the proper application of manure to crops, some contending that it should be taken fresh from the yards, spread over the ground, and dug in at once; others that it should be thrown up into a heap, and allowed to ferment until all the rank steam is thrown off. In digging or trenching the open quarters at this time for next season's crop it does not matter much about the stage of decay at which the manure has arrived, as, should it be rough, a good deep opening can be taken out, and if the soil is heavy, the rougher the manure is so much the better; but it would not do to dig such into the open spaces amongst fruit trees. If the soil is heavy, rotted stable manure is the best stimulant. In light soils cow and stable manure is the best, as the trees in such soils suffer much from want of moisture at the roots, and when cow manure is used the ground is always closer in texture, and the moisture is not given off so rapidly. We use a fork when digging the borders, and merely stir up the surface sufficiently deep to cover the dressing of manure that has been applied to the surface; but before doing so the trees should be pruned, and if necessary cleaned.

For a few years the caterpillar of the Lackey Moth troubled us, but this seems now to be pretty well eradicated; but we shall never get it completely destroyed while Quick hedges and Apple trees in the immediate vicinity, over which we have no control, are allowed to become the pasture ground of myriads of the caterpillar every year. It may be as well to hint to those who had it on their trees last year that the eggs may now be found glued firmly in circles to the smaller branches of the trees. The circles are usually about a quarter of an inch wide; these should be closely searched for when the trees are being pruned. They ought to be thrown into the fire, or in some other way effectually destroyed. We have not yet managed to discover the Apple-borer in his winter haunts. This is now the most destructive enemy we have to contend against, and if we could ascertain the exact time and manner of his transformation we could possibly destroy it in the egg state. American blight should also be destroyed by dressing the parts attacked with boiled oil. It is dangerous to smother the branches with the oil, as it will frequently kill not only the buds, but also the smaller branches.

Our pruning was done during the autumn months; but in

many places if pruning is done at all it has to be done in winter. The present is very suitable weather for getting all such work done, as after a thaw a terrible mess is made by the necessary treading upon the borders. Espaliers require to be carefully fastened to the wires with good tar string. Old branches frequently become crowded with ugly spurs, which by continued pinching and cutting-back have become overcrowded with wood and but few fruit buds; frequent thinning-out is necessary under such circumstances. The wall border has been dug up after being well dressed with manure as a preparation for an early crop of Peas and Potatoes; but no winter pruning or nailing has yet been done to the wall trees.

KITCHEN GARDEN.

Put in a batch of pots full of Sea-kale into the forcing house, plunging them overhead in cocoa-nut fibre refuse. This is an excellent material for such a purpose when it can be obtained. Our method of procedure is to plunge the pots (and the most suitable are those denominated 8's, they are 11½ inches diameter inside measure) to the rims, then invert another pot the same size over this one, and fill-up with the fibre refuse, so that the whole are quite covered.

We do not force Asparagus very early, if we did it would be by heated pits and not hotbeds. Very often the roots of the Asparagus are injured by overhot manure. When plenty of fallen leaves can be obtained then the heat is more uniform, does not become overheated, and is of longer continuance. Three 3-inch pipes will be amply sufficient to heat a bed 8 or 9 feet wide if placed about 18 inches below the surface. The pipes ought to be covered over with brickbats and some rough litter, straw, or freshly-cut turf over that to prevent the soil from mixing with the drainage; any sort of mould will answer to plant the roots into. Except in favoured districts Lettuce and Endive ready for using are best protected in glass frames. The border of a light orchard house is also well adapted for them; even hand-lights keep the leaves dry, and consequently better able to resist the attacks of severe frost. Mustard and Cress should be sown at intervals of eight or ten days, and the pans or boxes placed in any of the forcing houses.

FLOWER GARDEN AND SHRUBBERY.

In favourable weather any alterations may be proceeded with. It has been necessary to re-arrange the shrubs in the gardens here two or three times during the last ten years; sometimes the plants become too much crowded. A bed of Hollies and another of Rhododendrons that were planted for early effect soon became too thickly placed, but the superfluous bushes came in very useful as single specimens or for mixing amongst other shrubs. We do not attempt to transplant in very wet weather or in a frost. The best way to lift any tree or bush, if it is too large for a man to move it, is to dig round in a circle from the bole of the tree, and after working down deep enough the ball is undermined with a digging-fork, and a mat or two fastened firmly round and under the ball enables the plant to be lifted bodily out without injuring it in the least. The different varieties of Aucuba ought to be planted universally, especially in the neighbourhood of large towns. We have many male and female specimens. The females are annually loaded with berries without any artificial impregnation of the flowers. It is almost labour in vain to plant in poor gravelly soil without any previous preparation. If there is not from 2 to 3 feet of good soil the gravel should be cleared out to that depth, and good loam put in to place round the roots. No leaves or litter of any kind should now be allowed in the dressed grounds, the lawn swept and rolled weekly, and any weeds on the walks may be picked up by hand in mild weather.

GREENHOUSE AND CONSERVATORY.

We are washing glass and woodwork, cleaning and arranging the plants. Very little water is required at this time for many plants; those with leaves, such as Cinerarias and Calceolarias, suffer if allowed to become dry. Zonal Pelargoniums ought to be quite dry before being watered. The first appearance of aphid on Calceolarias is the signal for the fumigator; but no such pests should be allowed on any class of plants. It is sometimes not necessary to fumigate the house, as only a few plants may be attacked. When such is the case, a good plan is to use a small brush to dislodge the insects.

Crowea saligna is a very useful conservatory or greenhouse plant for supplying cut flowers. It continues in flower for two or three months, and requires the same treatment as most of the New Holland plants. *Statice profusa*, if the flowers are cut off in the summer months, is an excellent winter-blooming variety, but it is liable to be attacked with mildew. Dusting with sulphur on its first appearance is an effectual remedy. Many other greenhouse plants are subject to the attacks of this insidious pest, and must be watched for very closely.

Pruning Pot Roses.—These are not pruned all at the same time, but at stated intervals; but before pruning allow the soil in the pots to become rather dry, to prevent bleeding.—J. DOUGLAS.

TRADE CATALOGUE RECEIVED.

Lawson Seed and Nursery Company (Limited), 106, Southwark Street, London, S.E., and 1, George IV. Bridge, Edinburgh.—*List of Forest Trees, Shrubs, &c.*

TO CORRESPONDENTS.

* * All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

BOOKS (*Pomona*).—The "Fruit Manual" is in an advanced state towards completion, and the forthcoming edition will be a great enlargement of those that have preceded it. The price at which it will be published has not yet been fixed. (*H. A. P.*).—The "Garden Manual" contains instructions upon Vines and general gardening. It may be had by post from our office for 1s. 8d.

CAMELLIA BUDS DROPPING (*I. R. B.*).—Read our answer to another correspondent last week.

CANKER APPEARING (*G. C.*).—Your Apple trees have probably rooted into the gravel, which induces canker. Trenching and making the soil deep are no advantage; to render fruit trees healthy and productive their roots should be induced near the surface and to extend horizontally. We recommend you to have all the descending roots cut away, and manure the surface annually to tempt the roots upwards.

GRAPES SCALDING (*E. G.*).—The answers we have given embody the opinion of first-rate fruit-growers as well as our own. You will never be answered unpleasantly. We believe that the application of tepid liquid manure persevered in during the whole period of growth would prevent the gangrene. However, if you will state your case again fully, and tell what has been done by you without success, we will submit it to a good authority.

ORCHID SEED SOWING (*H. W.*).—The seed should be sown in pots filled with the usual Orchid compost, the pots being half filled with crocks, and then filled-up with crocks, chopped sphagnum, and fibrous brown peat, raising the material, well mixed, high in the centre of the pots, and pressed very firm. Give a good watering, again press, and then dispose the seeds upon the surface, and give a light dusting with silver sand. If a kind which requires a block of wood, use one prepared in the usual way, and dispose the seed upon it. The pots or block should be placed in a close frame in the house which is moist and shady, and can be kept moist by very light sprinklings through a very fine-rosette syringe, not giving any air until the seeds have germinated, and then only at night, gradually insuring them to the air of the house. It is questionable whether the seed you save will be good, but of course you can test it, and with sound seed and care you may succeed in rearing plants.

NEGLECTED STRAWBERRY PLANTATIONS (*East Dene*).—The plants having formed masses of roots in the spaces between the rows, we should take out the rows of old plants, leaving the runners in the spaces, they being well rooted; then thin out so as to leave about three good plants in the rows at about 15 inches to 18 inches apart. Manure the spaces between the rows and about the plants, leaving the manure as a top-dressing during the winter, and early in March point it in with a fork, but not going deeper than 3 or 4 inches. The runners will give you finer fruit than the old plants, and from them you may secure runners for new beds. Secure such runners early next summer, pegging them down so as to have the plants well rooted for planting early in the season; the earlier the better.

GARDEN INFESTED WITH SLUGS (*Idem*).—Give a dressing of quicklime in mild weather, when the slugs will be near the surface, at the rate of a hundred bushels per acre, and after lysing a few days dig-in, or, if the ground is already dug, point it in with a fork. It is best applied early in autumn or in March. You may supplement it with a dressing of salt, at the rate of twenty bushels per acre, in March, or prior to putting-in the crops.

SEEDLING CALCEOLARIA CULTURE (*H. A. P.*).—They could not be better than in the frame at a foot distance from the glass, which is quite near enough, and having in the frame a cooler and moister atmosphere than in the greenhouse. We should leave them there as long as you can give them room and can exclude frost from the frame; but if you cannot safely do this remove them to a light, airy, and cool position in the greenhouse. Report them if necessary; do not allow them to become pot-bound.

VINES MILDEWED (*Idem*).—The leaf you sent us is badly mildewed. We should dust the leaves with flowers of sulphur, and keep the atmosphere cool and dry, removing the leaves as they turn yellow and burn them, pruning as soon as all the leaves have fallen, and burning the prunings. After pruning the Vines and freeing them of the loose bark, dress them with a composition of soft soap, 1 lb. to a gallon of tobacco juice, adding flowers of sulphur to bring it to the consistency of putty, and with this dress the Vines in every part, brushing it well into the angles and crevices, but taking care not to rub off the eyes.

TREATMENT OF VINES WITH PLANTS (*J. Bale*).—Clear away the leaves as they fall, and when all have fallen prune the Vines and have the house thoroughly cleaned, washing the woodwork and glass, removing from them any green or dirt, and whitewashing the walls. Dress the Vines after the house has been washed as described to another correspondent (*H. A. P.*) in to-day's Journal. Keep the house cool, but not so cool as to admit frost, which would injure your plants and do the Vines no good. At night a temperature of 40° from fire heat will insure the safety of the plants and do the Vines no harm, as they will not be unduly excited by it, and in the day we should not exceed 45° from fire heat; but it may, of course, in the daytime with sun and air rise to 50° or more, the rise being from natural and not artificial heat.

SELECTING BORDER FLOWERS (*A Constant Reader*).—We cannot undertake to prescribe desirable planting. In a few weeks we shall publish a new edition of "Garden Plans," with very numerous illustrations, showing how

to plant them, as well as single beds and borders; selections of plants, and how to cultivate them.

CUTTING THE ROOTS OFF APPLE TREES (E. M. P.).—Of course it was a great mistake to cut the small fibrous roots off. It will not be necessary to destroy the trees because of this, as plenty of new roots would be formed during last summer. The Victoria is one of the most useful Plums in cultivation. Lord Suffield and Gloria Mundi are both kitchen Apples. Plant Cox's Orange Pippin and Pomona.

KNIGHT'S MONARCH PEAR DROPPING PREMATURELY (B. Austin).—This Pear has the same fault with us near London, and those fruits that remain on the tree are frequently only useful for cooking. And what is also singular, a few of the fruits will be melting and good, the largest proportion remaining quite hard. We advise you to re-graft with another variety.

VINES IN A NORTH BORDER (A. Constant Subscriber).—The Vines will answer planted in a north border, but not so well as in a south one, which will be warmer. With a covering of glass the north border would be improved, with the disadvantage, however, of warding off rains, and so rendering artificial ones necessary. Why not have the border made part of the house? It would then have warmth, and the space would be useful.

WHITE BUG AND GREENHOUSE PLANTS (Idem).—What white bug may be we cannot tell, unless it be mealy bug, which is the most difficult of all pests to free plants of after they once become infested. Brushing, which you employ, only, as you say, wards them off for a short time; they only being brushed off is only a direct way of spreading the pest upon other plants—in fact, it will exist upon woodwork and anywhere where there is dryness, but where there is moisture it does not spread so fast, especially if the plants are forcibly syringed. We should remove the plants from the house, and syringe them one by one outdoors with water at a temperature of 120°, laying the plants on their sides, and turning them round so as to thoroughly cleanse the plants of the pests, the water being forcibly directed against them so as to drive them off the plants. Calm and mild weather should be chosen. Next summer we should place the plants outdoors for a short time, and during rains, which is the best antidote to this pest known. The strictest search should be kept up for the pest, and when any is seen, destroyed.

MEALY BUG ON TACSONIA PAN VOLEXMI (A. G.).—Fumigating with tobacco will not destroy it, and it will only be overcome at great pains, diligent, continued effort. The best plan we have found for cleaning climbers on roofs is to, after thinning-out the shoots as much as desirable, wash every leaf, shoot, and stem with a solution of soft soap—half a pound to two quarts of water, adding a wineglassful of spirits of turpentine to it, and thoroughly mixing. This to be applied with a soft brush, and taking care to reach every eye, angle, and crevice. This is a tedious process, but one that persevered in will soon cover considerable ground. It is likely the solution will injure the plant's leaves somewhat, as they are hairy, and cannot endure so much as plants with smooth leaves. We do not know of anything or nearly so good for this pest, which we are exterminating by its persevering use.

PROPAGATING CHRYSANTHEMUMS (Idem).—Take cuttings and pot them singly in small pots. They will root slowly but surely in a cool house. The plants may be kept in a sheltered position outdoors until March, when you may take cuttings, striking them in gentle heat, and if the old plants are not wanted for outdoors, throwing them away. Azaleas and Camellias ought not at this time of year to be syringed. Adiantum Farlyense does not thrive, probably for want of heat and a regular state of moisture in the atmosphere. It does not also do well if pot-bound. A temperature of 60° to 65° from fire heat at this season is suitable. The Orchids you name ought not to be syringed, or very lightly once a-day, but keeping moderately moist, and a temperature of 60° to 65° from fire heat, but 5° less in very severe weather, and at night in severe weather. No good results in cold weather of maintaining a high temperature.

ARUM TRIPHYLLUM (Kittie).—It is hardy, doing best in sandy loam enriched with vegetable soil. Vallota purpurea ought not to be dried-off, but kept moist, increasing the supply with the growth.

BRIAR CUTTINGS (Idem).—The shoots or cuttings are best having a heel, or taken off close to the stem whence they proceed. The eyes on the depth they are inserted in the ground, which should be two-thirds their length, should be removed, and the cuttings may be 10 inches long. If they grow you may bud them in July, or when they are sufficiently strong.

EVERGREEN CLIMBERS FOR HOUSE WALL (A. D.).—There are no evergreen climbers but the Ivies, and these we should employ for the north aspect only. The best for this purpose are *Hedera canariensis* (hibernica) and *vars. latifolia maculata* and *variegata*; *H. Helix digitata* and *H. Regeriana*. Evergreen shrubs, but not climbers, for the walls are, for south aspect, *Ceanothus aznreus*, *C. floribundus*, *C. integrifolius*, *Eucallonia macrosantha*, and *Garrya elliptica*. East and west—*Crataegus pyracantha* and *var. crenulata*, and *Cotoneaster microphylla*. Those are evergreen; but why restrict yourself to evergreens? *Jasminum nudiflorum* flowers in winter, and *Cydonia japonica* in early spring. *Jasminum officinale grandiflorum* is very sweet, *Glycine sinensis* is beautiful; and the *Clematises Lawsoniana*, *Henryi*, *Lucie Lemoine*, *Jackmanni*, and *Symeana* are good; also *Caprifolium flexuosum* and *C. sempervirens floribundum*; and upon the south aspect *Marshall Niel*, *Climbing Devonensis*, and other Roses, would we think please you better than all evergreens. Defer planting until March.

PLANTING GARLIC, &c. (W. W. B.).—The planting of all you name is best done in February or March.

NAMES OF FRUITS (W. B. B.).—No. 21, Ribston Pippin; 17, Golden Pearmain; 7, Manks Codlin, poor specimen; 4, Winter Quoining. (*J. E.*)—1, Not identified; 2, Golden Pearmain.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE EXHIBITION DORKING.—No. 2.

BY T. COKE BURNELL.

I WILL now suppose that some one of my readers has determined to take up Dorking fowls for exhibition, or, perhaps, is only desirous of improving his present stock of poultry by the introduction of fresh blood of the best strains. The question will be, What is the best way to proceed? In my own case I attended the nearest poultry exhibition with the intention of

buying one or two of the best birds for, as I expected, a pound or two. You may imagine my disgust on finding all the prize birds priced at £100, and all the rest at nearly equally high prices. However, I presently came to the "selling classes," where the price of the competing specimens is usually limited to 30s.; and seeing that the second-prize bird was a Dorking cock entered at that price, and by the catalogue eight months old, I rushed off to the Secretary's office, and after a good deal of pushing and struggling secured him at that price, also a pair of highly-commended hens at the same figure, and returned home very well satisfied with my day's work.

I was so pleased with my new purchases that I invited the poultryman from the neighbouring farm to be present when they were unpacked, and busied myself immensely with wood-work and wire netting to have a separate place for them on arrival, so that they might not be contaminated by low-born company. The birds appeared in good time, and were let out and fed, and I confess that they did not look quite so well to me on the ground as when I saw them in a show pen: and I may as well here add that I have found this opinion strengthened by experience, and my readers may take it as a rule that seeing birds at an exhibition is very deceptive, and that if the pens are placed high up it makes them look half as large again. However, to my story: the man caught hold of the cock, and passing his hand down his breastbone, remarked that it was so crooked "that you could put your fist into it, and asked me to look at the length and sharpness of his spurs, and the scales on his legs, and said he was certain that the bird was at the very least five years old. I strenuously denied this, as the catalogue said he was eight months old. The hens, however, seemed to please him, as he remarked they were very large, and so they were left.

I could not keep long away from my new purchase, and on returning to the pen in an hour or two I found the cock's head all covered with blood, and one of the hens' beak in the same state. This rather astonished me, and I thought the cock and hen must have been fighting, which I considered very ungallant on the part of the old Dorking cock, who I had always heard styled "the pattern of an English gentleman." I watched them for a little while, and soon saw the hen go up to the cock very affectionately and commence to peck his comb, which was already streaming with blood, and to my astonishment the latter seemed to enjoy it; but I now thought it high time to interfere before the cannibal hen should have quite eaten his comb away. To make a long story short, the cock proved old and useless, one of the hens was an inveterate comb-eater, while the other laid shell-less eggs, the extreme value of the three being about 4s. to make into soup, which was their ultimate destination.

I could give more instances of disappointment from buying birds in a "selling class" were it necessary, but I shall only mention this one as a sample of the others, so that intending purchasers in a "selling class" may draw their own inferences. I do not for an instant deny that bargains are occasionally to be picked-up in "selling classes," but only by good judges who are able to appreciate the merits of birds which some amateur does not know the value of; but I am more than ever convinced that beginners had better steer clear of them. In trying, then, to solve the question, Where are good birds to be obtained? I will not attempt to give advice to old fanciers, most of whom are well able to teach me, but simply, if possible, to give a few hints in a crude form to assist beginners.

I recommend anyone really ignorant of fancy points and all that is required in a good bird, and who has not sufficient confidence in his own opinion nor time to attend an auction, to apply to one of the well-known dealers, who, if he asks him a good price, will give him a good bird, or else to write to one of the numerous successful exhibitors of the day, stating your wants and the amount you intend to give, leaving all details to the exhibitor, and trusting him to send you the value for your money. I have the pleasure of the acquaintance of nearly all the leading Dorking exhibitors, and am convinced that not one would take an advantage of a beginner were he to evince confidence; but when anyone writes pretending to be a good judge the exhibitor will often expect him to find out the defects for himself.

There are many who do not like to buy birds without previously seeing them. I would recommend such to buy their birds "on approval," by which is commonly meant that, if the fowls are not approved of they may be returned, the intending purchaser, of course, paying all carriage both going and returning, and also being answerable that the birds reach home in safety. Of course, any special agreement can be made that is thought necessary, but buyers are invariably expected to send the money before the birds are sent off. An honest purchaser should have no objection to this, as it will be readily understood that in these days of sharp practice vendors must be on their guard, as many apply to have birds sent them on approval who have not the least intention of either paying for or returning them.

The next question will be, At what time of year are we most likely to procure birds at a moderate price? This will depend

upon what it is we require. A really good bird, and one likely to win at good shows, has always a certain value, and I should look with suspicion on any advertiser who offers such at a very low price; but inferior birds, "wasters," as they are called, are much more plentiful at one time of year than another. I should recommend anyone who keeps four or five cocks running together, and who wishes for a change of blood of the best strains, to apply to one of the large breeders and exhibitors about June or July in each year, when they must have a large number of chickens from ten to fifteen weeks old, and when they would generally be only too glad to get rid of half a dozen young cockerels showing slight defects for exhibition, but equally good as their best for the purpose required, at from 10s. to 15s. each. Necessarily for a single bird they would charge rather more. One great advantage of procuring cockerel chickens of this age is, that they will not attempt to fight the old birds if introduced into a strange yard; while they will grow up with your own chickens, and you will escape all the fighting and destruction which is the inevitable result of introducing a full-grown cock into a new yard. This object may also be attained by purchasing sittings of eggs, but in doing so too great care cannot be expended in ascertaining in the first place whether the advertiser really has good stock; and secondly, whether, if he has, if he will let you have the eggs from them. There are many complaints of bought eggs not hatching, but anyone who knows what a little is required to spoil a clutch of eggs will not always attribute failure to the roguery of the vendor, though I am sorry to express my belief that the latter is sometimes the case.

BIRMINGHAM POULTRY SHOW.

(Concluded from page 508.)

HAMBURGERS were generally very superior. In *Black cocks*, 1205, the Palace winner, in splendid condition was again in the front; second, rather coarse in comb; third, 1201 (Robinson), a pretty neat bird. Pen 1190 (Beldon), we liked generally as well as the second.

Hens.—First and second, grand pairs; third, not so good in colour. All in their right position.

Golden-pencilled cocks.—1235 (Walker), the Palace cup bird in magnificent trim, carried off first honours. Second and third, good birds.

Silver-pencilled cocks.—First, 1244 (Beldon), a charming bird, beautifully marked in the tail. Second and third, good.

Golden-pencilled hens.—1255 (Duckworth), first, a beautiful pair, good in all points. Second, sound in ground colour. Third, beautifully pencilled but rather pale in colour.

Silver-pencilled hens.—First, a fine pair, rather heavily pencilled. Second and third, extremely good.

Golden-spangled cocks.—Neat in comb and good throughout. Second, pretty bird and well pencilled, but showing a little white between the legs; we fancied we saw him at Oxford, if so his feathers are now more perfect.

Silver-spangled cocks.—All the winners good. First, a little coarse in comb, or otherwise perfect.

Golden-spangled hens.—Here the competition was very close, but we thought the first deserved his position, being generally the most perfect.

Silver-spangled hens.—First, 1325, a delightful pair in beautiful condition, and well matched. Second and third, good pens, the latter not quite a match, or they would have been second.

GAME, Black-breasted Red.—The *cocks*, with the exception of the first (Dutton's), and second (Matthews), were a poor lot. The first was good in colour and carriage. The second had a better head, was shorter in feather, but a little queer on the feet.

Cockerels showed no improvement upon the old birds. The first (Matthews), the winner, we believe, at the Palace and Oxford, was a fine bird. Second (Harley), good, but we thought him a little long in flights. Third and fourth moderate, both coarse in tail.

Hens were better; the winner (Matthews) was a thorough Game bird of splendid style. Second and third, good.

Pullets.—1476, first (Matthews), who secured the cup very closely pressed by the second pen (1475), the Palace winners, we think: in some respects we preferred the second. Third and fourth (same owner), good. Fifth, a little high in tail.

Brown-breasted Red cocks.—1535 (Brierley), first and extra cup, a little thick perhaps in head, but otherwise perfect. Second and third tolerably good, the latter a little high in tail. We thought we recognised the Palace cup-winner here unnoticed.

Cockerels.—1537 (Burgess), a nice bird, a little long in hackle. Second (1533) good, but struck us as being a little arched in the back. Third, fourth, and fifth, nice birds and in their proper positions.

Hens.—1536, first, fine, very dark in colour: second, smart; third and fourth, judiciously selected.

Pullets.—1623, first (Brierley), an easy win, a beautiful creature of grand style. Second, good, but we thought him rather

narrow. Pen 1593, fourth, the Oxford winner (Matthews), should have been more forward in the prize list.

Duckwing cocks were a poor lot. 1612 (Winwood) was awarded first prize; but an objection was raised, and upon inspection the bird was found to have been dyed, and was consequently disqualified. This put 1635 (Phillips) first, a good bird, but slightly mottled on the breast.

Cockerels.—First 1662 (Winwood), a smart bird, rather long in hackle. 1665 a little grey in hackles, otherwise good. 1650, third, we rather preferred to second, being clear in hackle, and other points equal.

Hens.—1741, first, was a little flat in sides and not good in colour. Second, 1671 (Matthews), smart, but not in feather. 1675, third (Sales), a little short in head, otherwise grand.

Pullets.—First, 1686, had some very good points, but was too rusty on the wing for a prizewinner. Second and third were fine birds. We should like to have seen pen 1678, highly commended (Goodwin), and a pen of Mr. Fletcher's in the prize list.

Black and Brassy-winged were only a moderate lot, calling for no special notice.

Piles.—First, 1774 (Brierley), a smart bird, exhibiting some signs of the Malay. Second, 1720 (Walton), very nice in colour.

Hens or Pullets.—First, 1720, good all round. Second, 1721, a superior pullet, but little open in tail. 1729 (Winwood), smart pullet. First, we think, at the Palace was unnoticed.

GAME BANTAMS.—*Black-breasted Reds.*—Cock and two hens, 1775, first (Addie), smart cock, hens not quite up to him. Second, 1772 (Enwistle), a thorough Game pen, cock not so stylish as the winner. Third, 1773, was closely pressed by 1767, fourth. We almost think we preferred the latter.

Brown Reds.—1785, first, a splendid bird with two good pullets. We think we remember one of them at the Palace unnoticed, and thought she was best in the class.

Any other variety.—Not so good as the other classes. Pen 1791, first, had some good points.

Single Cocks (Reds).—First, 1806 (Addie), a very smart stylish bird, similar in stamp to 1775. *Any other Variety.*—First, 1833 (Fletcher), a beautiful bird, the best Duckwing we have seen this year. Second (Brownlie), a Pile well known. Third (Shumach), the Palace winner, we think, but here fairly beaten.

DUCKS.—Ducks had eight classes. *Aylesbury and Rouen* both show a satisfactory improvement in weight, especially the former, the first-prize in each weighing respectively 19 lbs. 8 ozs. and 19 lbs. 14 ozs. In *Blacks*, 1932 (Sainsbury), was first. We think this pen (or the light deceived us), better matched than at the Palace.

The other varieties of Ducks were not largely represented, but some very interesting specimens were to be found.

GEESE compared with Turkeys were not numerous. Mr. Walker was deservedly placed first for Whites, and Mr. Fowler for Greys.

TURKEYS had four classes, all well filled. The *cocks* of 1874 reached thirty-one entries, and the class for *hens* nineteen. The old cocks in weight were not up to last year. The other classes show a satisfactory increase.

In conclusion we think the poultry classes have improved upon last year. Some certainly are not so good, notably the Brahmas; on the other hand the Buff Cochins, Game, and Game Bantams show considerable progress in the right direction. The Pigeons we regret were not better supported. The schedule is liberal enough; the Committee have only to find better accommodation for them, and the classes will be again well filled.

THE YORKSHIRE SOCIETY'S EXHIBITION OF POULTRY, &c.

THE eighteenth annual Show of the York Society took place on the 1st, 2nd, and 3rd inst. in the Cattle Market. The poultry pens, which were of wood with wire fronts, were well placed three-tier high, and the birds mostly quite easy to examine. In *Dorkings* Mr. Widdas won with a grand pen of chickens, but we failed to appreciate the second award, preferring the third and fourth as better in most points. *Spanish* were moderate in both classes, Mr. Brown's pen of chickens being well worthy of their position. In *Buff Cochins* the first prize went to a grand pen of chickens, and the second to old birds, Whites taking the first position in the next class, with Partridge second and third. In *Brahmas* the first went to a pen of chickens, the pullet beautifully pencilled, but the cock extremely poor; while the second prize went a much better pen of old birds, which were very massive and good in all points; both were Dark. *Game (Reds)* were well placed, Messrs. Adams winning first with a grand pen of adult Brown Reds; the second were also of that kind. In *Duckwings* Messrs. Adams again won the first place with a sound well-shown pen of old birds, the second going to a coarse-headed pair, to which we preferred Mr. Staveley's pen, as being more stylish and better in head. In the next two classes *Piles* won in both cases. *Hamburgs* came next, but these were bad as a section, though there were some grand

birds shown by Messrs. Walker, Driver, Long, &c. In Gold-pencils the best pen in the class was placed second (Walker); the next best pen (Driver) was not noticed. The winning first pen might have been placed third. In the rest of them there was nothing of note except the winners. The Gold-spangles, being placed at the bottom, were very difficult to examine, and this was also the case with the *Bantams*, the pens being small and crowded, and the light not good.

PIGEONS were not a large entry, but there were some very good birds. The Black Carrier cock to which the cup was awarded was a gem, and in this class we found a card of disqualification for trimming upon pen 482 (J. Thompson, Bingley). Carrier hens were fair, Blacks winning. In Pouter cocks Mr. Hairsine's capital Black cock won first, Mr. Harvey's Blue coming in second, the order being reversed in hens in favour of a smart Blue hen belonging to the last-named gentleman. Of *Almonds* only one pen was shown. In other Short-faces Mr. Hawley showed an exquisite pair of Black Mottles; the second were Red Mottles, also very good. *Fantails* were a moderate lot. *Barbs* good; Duns first, and Blacks second. *Jacobins* were a fair lot; the two winning pairs of Reds very even, and a close run. *Turbits* were badly placed; the Silvers, to which the first prize was awarded, were unworthy of a place, Mr. Moore's Blue being by far the best, the second best taking the right position. Mr. Sefton won all the prizes with *Dragoons* of grand quality of head and colour (Blue).

RABBITS.—The usual facilities for examining the Rabbits being denied us, and the Judge (who is at once a resident and a member of the Committee) being engaged at the door taking checks, we found it impossible to arrive at such information as would warrant our criticising the awards (a most desirable state of things for a judge no doubt), except in a few cases, which were the *Angoras*, *Silver-Greys*, and *Dutch*. The first-named we considered well placed as regards the winners, Mr. Swetman's Rabbits being grand stock in all particulars. The winning *Himalayans* appeared to be good Rabbits; but in the awards in *Silver-Greys* we could not agree in the least, the first going to a very dark even-coloured animal (Schofield), second to one with well-silvered body, darkish head, and left ear half-lopped. The best of all the lot (Ball), which stood clear of all competition, was not noticed. In *Dutch* also we could not understand, the first awards going to a bad-coloured Grey-and-white with very large ears, but pretty well marked (Dickson); second, to the best Rabbit, a Black-and-white (Lund). The second best was a grand Tortoiseshell buck (Sabbage), which was altogether unnoticed. The entries were good.

DORKINGS.—I. C. Widdas, Howden-le-Wear, Darlington. 2. J. Newall, Clifton. York. 3. J. Carr, Whitby. 4. R. W. Richardson, Beverley.

SPANISH.—I. E. Brown, Sheffield. 2. Fallister & Hawkins, Topcliffe, Thirsk. 3. J. Thresh, Bradford. *Chickens*.—I. E. Brown. 2. J. Thresh. 3. Fallister and Hawkins.

COCHIN-CHINA.—*Yellow or Buff*.—I. D. & J. Heston, Whitby. 2. J. White, Whiteley, Netherthorn, Wakefield. 3. W. Mitchell, Birkenhead, Leeds. 4. G. Palfreyman, jun., Healey, Sheffield. *hc*, J. North, Huddersfield. *Any other colour*.—I. C. Carr, Walsden, Bingley. 2. H. White, 3. T. Al. Derry, Geddes. 4. T. Pierson, Rosedale West, Pickering. *hc*, Miss H. Williams, Aylesbury. c. R. E. Deane, Pocklington.

BAHMA POOTRA.—I. Dr. Holmes, Whitecoats, Chesterfield. 2. W. Whiteley, Sheffield. *hc*, Rev. A. H. Cumming, Northallerton; E. Ryder, Hyde, Manchester. 3. T. Dodson, Kirbymoorside.

GAME.—*Black-breasted or other Reds*.—I. W. & H. Adams, Beverley. 2. Lister & Ponder, Seamer, Yarm. *Duckings*.—I. W. & H. Adams. 2. J. Watson, Kirkstouff, C. J. A. & H. H. Savelley, Driffield. *Any other variety*.—I. W. Green, Earswick, York. 2. W. Smith, Easthorpe, Bottesford. *Any variety*.—*Chickens*.—1, 2, and *hc*, G. S. Thompson, Moorlands, York. c. A. Sugden, Swinley, Cleckheaton; G. C. Wilson, Milnthorpe; C. Carter, Bedale.

HAMBOURG.—*Golden-pencilled*.—I. J. Smith, Gilestead, Bingley. 2. J. Walker, Birstwith, Ripley. 3. J. Long, Bromley Common. *Silver-pencilled*.—I. J. Walker. 3. and c. H. Smith, Keighley.

HAMBOURG.—*Golden-spangled*.—I. J. Long. 2. J. Walker. 3. R. Newby, Welhorn, York. *Silver-spangled*.—I. J. Walker. 2. Richardson, York. 3. J. Tiplady, Newport.

POLISH.—I. J. Long. 2. G. W. Boothby, Louth. *hc*, W. Harvey, Sheffield. c. C. Walker, Boroughbridge.

BANTAMS.—*Game*.—I. A. Sugden, Swinley, Cleckheaton. 2. H. Butler, Bradford. 3. J. R. Kingston, Clifton, York. J. Walshaw, Bentley. c. H. Butler; W. & H. Adams; W. Harvey. *Laced*.—1 and *hc*, W. Richardson. 2. J. H. Law, Highgate, Birmingham. *Any other variety*.—1, J. R. Kingston, Clifton, York. 2. J. Sherwin, Ripon.

ANY OTHER VARIETY.—I. J. Walker (Black Hamburghs). 2. T. Peirson, Pickering (Crève-Cœur). *hc*, R. I. Off, Woodmansey, Beverley (Sultans). CROSS BETWEEN TWO PURE BREEDS MOST SUITABLE FOR THE TABLE.—I. J. A. Cass, Hovingham. 2. G. Hutchinson, York. *hc*, W. S. Dobson, Marton, Kirby Moorside. c. Mrs. C. Tarbotton, Cawton, Gilling.

TURKEYS.—I. Mrs. Parker, Thirsk. 2. Miss Jordan, Driffield. *Poult*.—I. T. P. Carver, Langthorpe, Boroughbridge. 2 and *hc*, Miss Jordan. c. J. White, Brandy, Easingwold.

GESE.—I. Capt. L. Anyon, Whittle-le-Woods, Chorley. 2. J. White, Whitley Netherthorn, Wakefield. *hc*, R. Garbutt, Watergate, Ampleforth, Oswaldkirk. c. J. A. Cass.

DUCKS.—*Aylesbury*.—1 and 2, C. Holt, Rochdale. *hc*, T. P. Carver. c. W. Stonehouse, Darnholme, Gouthard, Pickering. *Rouen*.—I. G. Garbutt, Sinnington, Pickering. 2, C. Holt. *hc*, J. Coates, Easingwold. c. Mrs. Stamper, Oswaldkirk. *Any other variety*.—I. A. & W. H. Silvester, Sheffield (Mandarin). 2 and c. R. W. Richardson (Black East Indian and White Call). *hc*, G. Robinson, Kexby, York.

SELLING CLASS.—I. W. & H. Adams (Brown Red Game). 2. R. W. Richardson (Dorkings). 3. Mrs. E. Kirk, Poppleton, York (Brahmas). *hc*, W. Mitchell, Birkenhead, Leeds (Cochins). c. T. E. Satterthwaite, Castle Howard (Dorkings); Mrs. E. Kirk (Brahmas).

PIGEONS.

CARRIERS.—*Cock*.—Cup, 1, and *hc*, W. Sefton, Blackburn. 2, A. T. Umpleby, Boroughbridge. *Hen*.—1, W. Moore, Pickering. 2, W. Sefton.

POUTERS.—*Cock*.—1, J. Hairsine, Hull. 2, W. Harvey. *hc*, J. P. Fawcett, Flowergate, Whitby. *Hen*.—1, W. Harvey. 2, J. Harrison, York. *hc*, J. Hairsine.

TOMBLERS.—*Almond*.—1, A. & W. H. Silvester. *Any other variety, Short-faced*.—1, J. Hawley, Gillingham, Bradford. 2, A. & W. H. Silvester. *hc*, J. S. Marten, York. c. E. Kirk, Walmgate, York.

FANTAILS.—1, G. Linfoot, York. 2, J. P. Loversidge, Newark. *hc*, F. Joy, Walmgate, York. c. T. S. Stephenson, Newberrin, Beverley.

TRUMPETERS.—1, W. Harvey. 2, T. S. Stephenson.

BABBS.—1, W. Harvey. 2, J. Thresh, Bradford. c. W. T. Humphrey, York.

JACOBINS.—1, J. Thompson, Ferohill, Bingley. 2, R. W. Richardson.

TURBITS.—1, E. A. Thoroton. 2, T. S. Stephenson. *hc*, A. & W. H. Silvester.

c. J. Acenley, Pickering; W. Moore, Pickering.

OWLS.—1, W. C. Dawson, Otley. 2, G. W. Dutton, Chester.

NUSS.—1, J. Cargill. 2, T. P. Carver. *hc*, J. Hawley. c. R. W. Richardson.

DRAGONS.—1, 2, and c. W. Sefton.

ANTWEAPS.—1, F. Woodhouse, Blackburn. 2, A. Farndon, Hincley. *hc*, Rev. C. E. Camidge, York. c. G. Nicholson, York.

ANY OTHER VARIETY.—1, M. Ord, Sanis, Sedgfield (Turbitens). 2, W. C. Dawson, Otley (Ice). *hc*, C. Auton, York.

SELLING CLASS.—1, A. & W. H. Silvester. 2, W. C. Dawson. 3, C. R. Dixon, York (Silver Antweaps). *hc*, J. Thompson. c. T. Richardson (Blue Turbits).

RABBITS.

LOP-EARED.—*Self-coloured, taking all properties*.—*Buck or Doe*.—1, Dr. Boden, West Hartlepool. 2, T. Myton, Hunsate, York. *hc*, E. J. Fell, Blackburn. c. J. Bowman, Groves, York.

WHARTON, York. 2, F. T. Backs, Lodon. *hc*, T. Myton.

LOP-EARED.—*Tortoiseshell, taking all properties*.—*Buck or Doe*.—1, Dr. Boden.

2, F. T. Backs. *hc*, J. Iving, Blackburn. c. W. Bailey, Darlington.

LOP-EARED.—*Black-and-white, taking all properties*.—*Buck or Doe*.—1, F. T. Banks. 2, J. Cranch, St. John's Wood, London. c. T. Schofield, jun., Cheet-

ham, Manchester.

LOP-EARED.—*Grey-and-white or Blue-and-white, taking all properties*.—*Buck or Doe*.—1, J. Iving, Blackburn. 2, Mrs. Robinson, York.

HIMALAYAN.—*Buck or Doe*.—1 and 2, J. D. Eames, Great Driffield. *hc*, Mrs. Bowman. c. S. Ball, Bradford.

ANGORA.—*Buck or Doe*.—Cup, 1, and 2, H. Swetnam, Fulford, York. *hc*, W. Jacques, York. c. W. Bowes, Elmhurst, Darlington.

DUTCH.—*Buck or Doe*.—1, J. Dickson, York. 2, A. Lund, York. c. J. H. Prince, York.

ANY OTHER VARIETY.—*Buck or Doe*.—1, T. Schofield, jun. 2, H. Swetnam. *hc*, J. Hallas, Huddersfield. c. G. M. Duffell, York.

ANY OTHER VARIETY.—*Buck or Doe*.—1, F. Duke, York (Belgian Hare). 2, G. Linfoot, jun., York (Belgian Hare).

SELLING CLASS.—1, A. Jones, Wolverhampton. 2, F. Sabbage, Northampton. *hc*, C. Auton, York. c. D. Bowman (Lop-eared).

JUDGES.—*Poultry*: Mr. R. Teabay, Fullwood, Preston; Mr. F. Ferguson, Risby Park, Beverley. *Pigeons*: Mr. W. Massey, Spalding. *Rabbits*: Mr. M. Millington, Colliergate, York.

BRISTOL POULTRY AND PIGEON SHOW.—The entries for the above Show close next Tuesday, December 15th. The long list of cups and good money prizes ought to attract a grand collection of birds in the Drill Hall. Mr. Cambridge, we believe, alone is to be thanked for so spiritedly trying once more to make this Exhibition a success. We will, for our part, promise a full report of the Show department, as satisfactory as we feel sure Mr. Cambridge will make his. We understand the rules are all to be as strictly kept as ever. No one of any kind, save attendants, will be admitted previously to the hour of opening, and no favoured.

THE DRAGOON PIGEON.

I wish to say something about this extremely beautiful bird, and to attempt at last to rescue the real Dragoon from being set aside and a kind of Horseman being put in its place. I plead that both birds are fancy birds—birds of long lineage, and they both deserve a position at our shows; but the present danger consists in the true Dragoon being set aside and a new variety of bird—a kind of Horseman-Dragoon, taking its name and place.

It so happens that the Dragoon was the first fancy Pigeon that I bred. I had them in the year 1838. I then bred Ponters, and to get them longer, and without consulting any other person, crossed them with what was then called the Spanish Runt. I merely mention this in passing, but it is curious that I, a boy fancier, thus tried to improve the Ponter without any idea given me from anyone else. The colour of my Black and Red Ponters was splendid, but I did not like the birds being so small. I had also, I remember, good Chequers and Blues. But to return to the Dragoon. Mine were Grizzled, Mottled, and White. I had about the same time, purchased a few months later, Horsemen both Red and Yellow. I distinctly remember the two sorts and their differences. The book I worked by, which I have found this day among my own children's books, was "The Boys' Own Book," which contains engravings of Pigeons much superior to Girton's "Fancier." I do not say they are equal to the portraits of Pigeons now-a-days published, but they were the best of their day, and are not bad even now. Following the picture of the Carrier come the heads of the Horseman and Dragoon. Both are good; but as the Dragoon head is a profile it is better seen, and there you have the long thin head of the Dragoon proper, with little eye-wattle and no jew-wattle—almost precisely the same head as the Dragoon thus figured in this Journal in 1870 by the capital pencil of Mr. Ludlow. This portrait of his I call a Dragoon, with not an atom of Horseman about it, and like the Dragons I possessed in the years 1838 up to 1842.

Next I would speak of Horsemen and Dragons together. Both should in colour be wholly unlike Carriers. Carriers are Black, Dun, and Blue; formerly Black and Dun only or chiefly,

and indeed now chiefly. Horsemen and Dragoons be Blue, Red, Yellow, White, Grizzle, Silvers, &c. Next, Horsemen are distinct, and always were, from the high-type Black and Dun Carriers. There is a very old picture of one in oil at Hampton Court Palace. They were and are stouter birds than the true Dragoon, and these birds improved by skill take now the chief prizes as Dragoons.

That these prize Dragoons—the heavier sort—are sometimes also bred direct from a Carrier and Dragoon is also true. A friend of mine bred one from a black-beaked Carrier and a Dragoon. A great dealer admired it, bought it, and won many prizes with it, exhibiting it as a Dragoon, and this within recent years. Now no one will say that this bird was a true Dragoon; it was simply a young Horseman Carrier-bred in part.

I think that not only fancy Pigeons must not be allowed to deteriorate, but they must not be allowed to go under wrong names; and that those who are not themselves exhibitors, and

therefore have not their minds biassed or warped by the desire of taking prizes, are the best persons to speak out on this subject. The case stands thus: A man breeds or buys birds of a certain type, he gets prizes, he gets up a stock of such birds, and they are profitable; all the while they may be birds of a wrong type. Such is just the case with the successful exhibitors of the Horseman-Dragoons of the present day. Such also was the case with the Anglo-African Owls of a few years since; now they are English and African Owls which are shown. Why not exhibit Horsemen and Dragoons instead of Horseman-Dragoons? The reason is, that valuable Horseman-Dragoons throng the lofts of successful exhibitors.

Next, what should the true Dragoon be like? First, it should not be a large bird; the beak should not be short and thick; the eye should not be a little pinched at the back, but as circular as possible. The Dragoon should be a smallish, smart-looking, gracefully-formed bird, as unlike a Carrier in every respect as

Fig. 149.—THE DRAGOON PIGEON.

possible: the beak long and straight, the beak-wattle peg-shaped and no jew wattle, and no dent between beak and head; the neck should be thin, as indeed the whole body should, but the shoulders somewhat broad. In Blues the bars should be black and narrow. In brief, the Dragoon should be slightly built; as I have frequently written, he should be "a tight little, light little fellow."

Of modern describers of the right type of Dragoon Mr. Ludlow stands first as an accurate describer both with pen and pencil. Another accurate writer is Mr. Woodhouse, of Lynn. The place where the real Dragoon is seen and bred is Birmingham, and Birmingham is first for Dragoons as certainly as Glasgow is for Pouters. Let the so-called London style of bird be exhibited under his right, or nearly right, name—that of Horseman. As Mr. Ludlow has well said in the columns of a contemporary, "They are a lot of degenerate Carriers, big, heavy, and coarse." "Run as Dragoons, because there are no classes for Red, Yellow, or White Carriers, and they are not good enough to grapple with the Blacks and Duns."

In conclusion I would say, Exhibit Horsemen and exhibit Dragoons, but do not mingle the two. Fanciers, and those who are determined to keep the fancy up to the right mark, have, it appears to me, to do two things: Fight strenuously against all unfair doings, all trimming, staining, painting, &c.; fight against all turf-like tricks which threaten to banish honest men from, if not the fancy, the ranks of exhibitors. Then, too, resist attempts to alter the type of any variety of Pigeon, for there must in all common sense be but one style of bird, and not London

style and Birmingham style. It is true style, and the style of the successful exhibitor who, having bred up to a certain standard, naturally desires that standard to be preserved. If that standard be correct, keep to it by all means. I rejoice when any exhibitor breeds nearer and nearer to perfection, but if his style be the wrong type of bird I must disregard his breeches-pocket interest, and pronounce in favour of what is right, for right is right. We must persevere in a right course always. Mr. Bishop, of Dorchester, persevered with his true Silvers, and has succeeded in having a class for the correct bird at the Palace Show, in spite of the attractive appearance of the black-barred—i.e., the Blue-crossed Silvers. Both birds are very pretty, but true is true, right is right. A true and right Silver must have brown bars, for it always had. We must also remember that prizes are not always criterions of what is strictly correct; they ought to be, but they are not, and certainly they have not been of late in Dragoons.—WILTSHIRE RECTOR.

P.S.—Since writing the above I have read in the last issue of a contemporary the following:—"Mr. Graham has bought a bird from a friend of mine shown at the last Bradford Show. Now, this bird is bred from a Blue cock, which my friend intended at one time to breed Carriers from, and a half-bred Black Carrier hen! This bird, he says, is the best young Dragoon he has seen this year," whereas the truth is the bird is not a Dragoon at all. Take this anecdote, together with the one I have stated above, and we see that the heavy style that too often wins is a Horseman and not a Dragoon, or something of the kind of Horseman. At any rate this is not keeping the two varieties

distinct—the Carrier and Dragoon. But return to the old standard of Dragoon, the one still followed by the Birmingham fanciers, and you do keep the varieties quite distinct. I do not argue that the fine large Red, Yellow, and Blue birds be obliterated, only shown as Horsemen, which I believe to be their right name. People may reply—"What's in a name?" I answer, Much. A pony is one kind of horse, a cob is another; the pony is the Dragoon, the cob the Horseman. I need scarce point out how this distinction, Horseman and Dragoon, preserves the latter word from being vulgarised into *Dragon*. Moore wrote Dragoon, so of his successors; Eaton, a wholly uneducated man, naturally as such advocated Dragon, not knowing or understanding the etymology of words.—W. R.

WASHINGTON (CO. DURHAM) POULTRY SHOW.

THE first attempt to hold a show here was made on the 2nd inst., and, considering the amount at the disposal of the Committee, with excellent results. Through the inexperience of the Committee the schedule was somewhat faulty, otherwise much larger entries would have been obtained. Then in the Bantam section four classes were provided for Game, with none for the other varieties, and for Ducks there was only one class. The Show lasted only one day, and was held in a tent; Fothergill's excellent pens being used, and the wants of the birds were well attended to.

Dorkings were but poor; but the winning *Cochins* very fine in style, size, and colour, the cup pen (Mr. Procter's), old birds, were very even in colour; but the first-prize cockerel a little deeper in ground than is desirable. *Brahmas* were very good in both classes, Mr. Swann winning in old birds with a massive pen; Mr. Shield's birds coming in a good second. Young birds were a very even lot, the first-prize pullet grandly pencilled, yet it was a mere toss-up between that and Mr. Venables' grand pen. All the winners were of the Dark variety. *Spanish* were poor, except the adult winners. Of *Hamburghs* there was a fair entry and many good birds, the old and young in Gold-spangled first-prize pen being well marked, and very sound and even in colour. Golden-pencilled chickens were a near run for first honours, the first by far the best pullet, but the cockerel a little too red in tail. Silver-spangled won the cup, and were chickens of the season. The first in old Red *Game* were Black Reds, the cock fine in all points, but the hen, otherwise good, had a twisted comb, and except for this the pen would have had the cup for the section; the second were Brown Reds, also good. In chickens the first were Brown, and second Black Reds. Duckwings were very poor, except the two first, which were prize pens. *Houdans* would seem to be looking up, for we never recollect seeing so large and good a lot at any show in the north of England. The first in old birds (although the hen is not large in crest) were a grand pair, well matched in colour, large, and the cock's comb unusually good and of the proper type; the second losing only in that point. Chickens were also good, and an even lot. Adult *Polish* were every pen noticed, the first Silvers securing the cup also, though closely pressed by the first-named Houdans. Young *Polish* were first, and second Gold. In the Variety class a good pen of Malays took the first position, second going to Black *Hamburghs*. Of *Game Bantams* the entries were good, and the section perhaps the best in the Show. The old and young Black Reds were of the highest merit, and the cup given to a smart pen of chickens, which, if they had a fault, was a little too much of a well-carried tail. Duckwings and Piles were good, especially the former, but one pen might, with equal chance, have been shown in the large class. In *Ducks* the first were very large *Rouens*, second *Widgeon*, and extra second *Rouen*, while a third was given to *Aylesburys*.

Pigeons were not equal to the poultry in quality, although the prize birds were, as a rule, good specimens of their kinds, the *Dragoons* being a good class; while *Carriers* were not good; *Antwerps* being a fair lot. *Tumblers* were one of the best classes, an Almond cock was first; but this was not equal in head properties to the second-prize Agate, which was a gem in that respect. In *Owls* a Silver English was first, and Blue the second. In *Turbits* a very good Point-headed Silver was first and a Yellow second, many good birds being very foul on the thigh. *Barbs* were pretty good, Blacks taking both prizes. In *Jacobins* only the winners were of any use in the show pen, first Yellow, and second Red. *Fantails* were not good, except the first; but in the Variety were two capital birds, first a Blondinette, and second a Grey Frizzled Pigeon shown by Mr. Ord.

The show of *Cage Birds* was poor.

DORKINGS.—1, W. Swann, Bedlington. 2, J. N. Lawson, Preston. *hc*, A. Buglas, Durham. *Chickens*.—2, W. Ellison, Washington. **COCHINS.**—Cup, G. H. Procter, Durham. 2, G. Latimer, Washington. *Chickens*.—1, G. H. Procter. 2, J. N. Lawson. **BRAMA PIGEONS.**—1, W. Swann. 2, R. Shield, Swallow. *hc*, C. Venables, Castle Eden. *c*, J. H. Houghton, Houghton-le-Spring. *Chickens*.—1, R. Shield. 2 and 3, C. Venables. *vhc*, J. D. Upson, Usworth Colliery. *hc*, T. Noble, Washington; T. Allen, Newcastle. *c*, W. Wren, Old Shildon; G. MULES.—*Any variety.*—*Cock or Hen*.—1, G. E. Forster.

JUDGE.—Mr. E. Hutton, Pudsey, Leeds.

MR. GEORGE HELLEWELL, of Sheffield, well known for the great care he has for many years bestowed on the birds entrusted to his care for exhibition, is to have a testimonial presented to him. Mr. Wragg, Stoke Park, Ipswich, will receive subscriptions.

WELLINGBOROUGH POULTRY SHOW.

THE first grand annual Exhibition of Poultry, Pigeons, Rabbits, and Cage Birds took place on Friday and Saturday, December 4th and 5th, in the Corn Exchange, Wellingborough. The Birmingham and other Shows being held on or about the same time did not prevent the Wellingborough Committee having 575 entries.

The Canaries were a very pleasing feature in the Exhibition, occupying a centre stage in the large hall, which was entirely filled. The arrangements on the whole were tolerably good considering the maiden efforts of a very hard-working Committee of Management, who appeared to be quite alive to the requirements of the occasion. Mr. Adams, of Coventry, was again successful with his surprising high-coloured Canaries, and won the special prize, a silver medal, for the greatest aggregate number of points. It was a very easy win for him, although other breeders of note put in an appearance with several first-class birds. The classes for Canaries were not very numerous; there were about one hundred cages entered. Mr. W. G. Thompson, Secretary, was most indefatigable in his duties. Judging

was somewhat delayed; but this did not so materially affect the Cage Bird portion of the Show as it did the poultry. We would recommend the Committee another year to have an entire day set apart for judging; this would afford them a better opportunity of arranging the pens for the stock; however, "Rome wasn't built in a day." The Committee did well, and looked after the comfort of the Judges, representatives of the press, and friends, in a praiseworthy manner. The Exhibition was an entire success, having been well patronised by visitors. The Committee contemplate extending their prize list another year.

DORKINGS.—*Cock*.—1, Miss Murray, Thirlstone, Derby. 2, H. Feast, Swansea. 3, G. E. Pilgrim, Hincley; W. Nottage, Northampton; J. Gee, Oxford. *Hen*.—1, J. Gee, 2, W. H. Crewe, Strall, Derby. 3, R. Wood, jun., Mansfield, Notts. 4, H. Feast.

COCHIN-CHINAS.—*Cock*.—1, J. Groney, 2, J. Gunn, 3, Hon. and Rev. G. Vernon, 4, H. Feast; B. Cox, 5, P. H. Davies, jun., March, Camba; S. Barber, Hen. 1, W. H. Crewe, 2, Love, Kingthorpe, Northampton. 3, Hon. and Rev. G. Vernon, Grafton Underwood; A. F. Faulkner, Thrapstone. 4, J. Young, Redditch; W. H. Crewe.

BRAHMA COCHIN.—*Dark*.—*Cock*.—1, J. S. Clarke, Oundle. 2, W. Birch, Barnack, Coventry. 3, H. Stiles, jun., Keston, Kettering. 4, J. S. Clarke; H. Feast; J. M. Atkinson, Alford, Lincoln. 5, H. Feast. 2, M. Leno, Markyate Street, Dunstable. 3, J. S. Clarke; W. Hewson, Alford, Lincoln; W. Birch; J. Watts, Hazlewell Hall, King's Heath, Birmingham. 6, W. Stevens, Northampton.

BRAHMA POOTRA.—*Light*.—*Cock*.—1, Mrs. Peel, Sharnbrook, Beds. 2, M. Leno, 3, J. Hunter, Burton-on-Trent; R. Bird, Fulham, London. 4, A. F. Faulkner, Hen. 1, S. Sambrook, Chipping Camden, Gloucester. 2, M. Leno, 3, Mrs. Peel; J. Hunter; J. R. Marriott, Titchmarsh, Thrapstone (2); W. Birch.

SPANISH.—*Cock*.—1, J. F. Parker, Northampton. 2, J. Gunn, Coalville, Leicester. *Hen*.—1, J. F. Parker. 2, H. Yardley, Birmingham. 3, W. Adams, Northampton.

GAME.—*Black-breasted Red*.—*Cock*.—1, E. S. Godsell, Stroud, Gloucester. 2, H. Budge, Heaton, Derby. 3, B. Cox, Moulton, Northampton. *Hen*.—1 and 2, B. Cox.

Blue.—*Any other colour*.—*Cock*.—1, W. Tillotson, Coates, Leeds. 2, H. Battle, 3, T. Hancock, Northampton. *Hen*.—1, T. Hancock, 2, H. Lotan, Oundle. 3, E. Bockland, Oxford; W. Tillotson; B. Cox. 4, E. Bibby, Wellingborough.

HAMBOURG.—*Cock*.—1, T. Love, 2, S. W. Hallam, Whitwick, Leicester. 3, Hon. and Rev. G. Vernon; W. Griffin, Leicester; S. W. Hallam. 4, O. Thompson, Kettering. *Hen*.—1, T. Love, 2, A. Faulkner, 3, J. Robinson, Garstang. 4, S. W. Hallam (2); W. W. Tickner, Ipswich; J. Robinson. 5, J. C. H. Robinson, Faversham, Beds.

ANY OTHER VARIETY.—*Cock*.—1, G. W. Roathy, Louth (Golden Poland). 2, H. Feast, 3, A. W. H. Silvester, Sheffield (Polish); J. C. Beasley, Dallington, Northampton (Creve-Coeur); R. A. Boissier (Houdans). *Hen*.—1, A. W. H. Silvester (Polish). 2, H. Feast. 3, J. C. Beasley (Creve-Coeur).

LOCAL CLASSES.—1, Howard & Patenall, Wellingborough (Brown Red Game). 2, G. W. Sanders, Wellston (Wild Ducks). 3, G. Galer, Wellingborough (Rosen Ducks); S. E. Hobbs, Wellingborough (Game). 4, J. Burditt, Wellingborough (Muscovy Ducks); J. Compton, Wellingborough (Silver-spangled Hamburgs); C. Clayson, Wellingborough (Spanish); W. Horne, Wellingborough (Game).

DUCKS.—*Aylesbury or Rouen*.—1, J. Gee, 2, E. Hope, Wellingborough. 3, M. E. Jones, Wellingborough; Hon. and Rev. G. Vernon. 4, T. Plumb, Kingthorpe.

GAME BANTAMS.—*Black-breasted Red*.—*Cock*.—2, W. B. Jeffries, Ipswich. 3, W. Adams, Ipswich. 4, W. Baskerville, Manchester; R. Caborn, Biggleswade. 5, W. Adams. 2, W. Adams. 3, W. B. Jeffries, 4, W. Griffin; J. Mayo, Gloucester.

GAME BANTAMS.—*Any other colour*.—*Cock*.—1, W. Baskerville, 2, S. & J. J. Stephens, Ebbley, Stroud. 3, R. J. Hartley, Altrincham. *Hen*.—1, J. Mayo, 2, J. Pearse, Ely. 3, A. & J. J. Stephens.

BANTAMS.—*Any variety not Game*.—*Cock*.—1, A. Storrar, Peterborough. 2, A. and W. H. Silvester. 3, C. Reed, Cambridge. 4, H. Abrah, Hyde Park Place, London. *Hen*.—1, M. Leno, 2, J. Mayo. 3, Rev. F. Tearle, Gazeley Vicarage, Newmarket; R. H. Ashton.

PIGEONS.

POUTERS.—*Cock*.—1, R. H. Blacklock, Sunderland. 2 and Extra 2, C. Martin, Kettering. 3, R. Ashton, Huntingdon; J. Styles, jun.; R. H. Blacklock; C. Martin. 4, J. E. Palmer, Peterborough. *Hen*.—1, J. Styles, jun., Keston. 2, J. E. Palmer.

CARRIERS.—*Cock*.—1, E. Walker, Leicester. 2, J. Styles, jun. *Hen*.—1, E. Walker, 2, W. H. A. Miller, Walsall. 3, J. E. A. Palmer.

TOMBORES.—*Cock or Hen*.—1, H. Yardley, 2, A. & W. H. Silvester.

DRACOONS.—*Cock or Hen*.—1, W. V. Longe, Tuddenham Vicarage, Ipswich. 2, G. Middleton, Ashby-de-la-Zouch.

ANY OTHER VARIETY.—*Cock or Hen*.—1, H. Yardley, 2, W. Nottage, Northampton. 3, A. & W. H. Silvester. 4, C. Martin (Jacobins). 5, J. Atkins, Bedford (Hyacinth); W. Loveday (Blue Turbit); W. Brown, Northampton (Nun); W. H. A. Miller; J. Watts. 6, T. Chambers, Northampton (Foreign Owl); W. Patrick, Kettering (Pigmy Pouter).

SPECIAL SELLING CLASS.—*Cock or Hen*.—1, J. Martin (Pouter). 2, W. Nottage. 3, C. Reed (Barb). 4, Capt. T. Wetherall, Loddington, Kettering (Faintail); T. Chambers (Carrier); J. Atkins (Yellow Dragoon and White Pouter); W. V. Longe; C. Reed (Barb); R. Buffham, Spalding (Black Carrier); E. H. Clarke, Northampton (Dun Carrier); L. Watkins (White Pouters).

RABBITS.

LOP-EAR.—*Buck or Doe*.—1, J. Boyle, Blackburn. 2, F. T. Banks, Doughty Street, London.

HIMALAYAN.—*Buck or Doe*.—1, T. H. Dennis, Wellingborough. 2, J. Boyle.

DUTCH.—*Buck or Doe*.—1, J. Martin, Kettering. 2, F. Sabbage, Northampton.

ANY OTHER VARIETY.—*Buck or Doe*.—1, T. Garner, Northampton (Angora), 2, J. Martin, Northampton (Angora). 3, J. Boyle (Silver-Grey); J. Tebbitt, Northampton (Belgian Blue); E. Robinson, Kettering (Silver-Grey).

SPECIAL SELLING CLASS.—*Buck or Doe*.—1, F. Sabbage, 2, E. Robinson (Silver-Grey). 3, T. S. Lacey, Leicester (Blue and White); W. Hancock, Northampton (Angora). 4, J. Abbott, Dodington, Northampton; J. Martin (Angora).

LOCAL CLASS.—*Buck or Doe*.—2, J. Lonsdale, Wellingborough (Yellow and White). 3, C. J. King, Wellingborough (Tortoiseshell). 4, J. Abbott; F. Glover, Wellingborough (Angora). 5, J. Abbott; R. Sharp, Wellingborough (Lop).

CAGE BIRDS.

NOBWITH.—*Clear Jonque*.—1 and 2, J. Adams, Coventry. 3, H. Watson, Derby; J. Athersuch & Son, Coventry (2). 4, G. Cox, Northampton; Moore & Wynne, Northampton. 5, J. Clarke Derby. 6, Clear Buff. 1 and 2, J. Adams.

Jonque.—*Marked or Variegated*.—1 and 2, J. Adams. 3, J. Athersuch and Son. 4, J. Clarke. 5, Howe & Robinson, Wellingborough. 6, Clear or Variegated. 1, J. Torr, Derby. 2, J. Adams. 3, Howe & Robinson. 4, S. Stratford, Northampton. 5, J. Adams. 6, Disqualified, Moore & Wynne. 7, Cinnamon, Clear, Ticked, or Variegated. 1 and 2, J. Adams. 3, J. Athersuch and Son (2); Howe & Robinson. 4, C. Hillier, Northampton; Moore & Wynne; S. Tones.

BUFF.—*Marked or Variegated*.—1 and 2, J. Adams. 3, J. Athersuch and Son (3). 4, G. Cox; Moore & Wynne. 5, H. Watson. 6, Clear or Variegated. 1, J. Adams. 2, S. Stratford. 3, G. Cox; Martin & Griffin, North-

ampton. 4, J. Adams; J. Torr (2). 5, S. Tones, Northampton; Howe & Robinson. 6, Clear, Ticked, or Variegated. 1 and 2, J. Adams. 3, J. Athersuch & Son; Moore & Wynne. 4, C. Hillier.

SELLING CLASS.—1, J. Athersuch & Son. 2, G. Cox. 3, S. Stratford. 4, J. Athersuch & Son; W. & T. Wright, Northampton; Moore & Wynne; S. Tones. 5, C. Hillier; S. Stratford; Moore & Wynne; S. Tones; Howe & Robinson (Marked and Clear Jonque). 6, G. Chipson; Howe & Robinson (Clear Jonque). 7, British Birds. 8, Any variety. 1, T. Knight, Northampton (Skyark). 2, A. Cleaver, Wellingborough (Hallinck). 3, W. & T. Wright. 4, A. E. Bayes, Wellingborough (Lark); J. Spencer, Wellingborough (Bulfinch).

JUDGES.—*Poultry and Pigeons*: Mr. W. B. Tegetmeier; *Rabbits*: Mr. G. Johnson; *Canaries*: Mr. G. J. Barnesby.

HAMILTON ORNITHOLOGICAL ASSOCIATION'S SHOW.

This Show was held in the Town Hall, Hamilton, on the 5th inst., when the following awards were made:—

DORKINGS.—1 and 3, Mrs. Alston, Craighead, Hamilton. 2, E. Hunter, Hamilton. 4, R. Shearer, Hamilton. *Chickens*.—1, W. Cornett, Dalsarf. 2, E. Hunter, Hamilton. 3, G. Scott, Lanark. 4, W. Scott, Prestfield, Blantyre.

SPANISH.—*Black*.—1, G. Cleland, Hamilton. 2, J. More, Avon Braes. 3, J. Hunter, Alva. 4, J. L. Horne, Airdrie. *Chickens*.—1, G. Cleland, Hamilton. 2, G. Scott. 3, J. More. 4, W. Smellie, Wishaw.

COCHIN or BRAHMA POOTRA.—1, A. M. Donald, Stirling. 2, T. Bruce, Busby. 3, J. Pollock, Busby. 4, Mrs. A. Craighead, Hamilton.

SCOTTISH GAES.—1, J. Meiklem, Thimacra, Quarter. 2, W. M. Millan, Silverwell, Bothwell. 3, Mrs. Lukeman, Hamilton. 4, W. Hamilton, Hamilton. *Chickens*.—1, J. Marshall, Hamilton. 2 and 3, Mrs. Lukeman. 4, C. Gray, Wishaw.

HAMBOURG.—*Golden-spangled*.—1 and 2, A. Begg, High Blantyre. 3, H. M. Millan, Blantyre. 4, S. Young, Craighead, Motherwell. *Golden-pencilled*.—1, J. Conkey, Darvel. 2, J. Mather, Strathaven. 3, C. W. Gibbs, Sutton Bridge. 4, S. Young, Rumblyingsyke.

HAMBOURG.—*Silver-spangled*.—1, A. Stirling, Grabamston, Barrhead. 2, S. Young, 3, R. Bruce, Busby. 4, J. Kerr, Cusrow, Stewarton. *Silver-pencilled*.—1, P. Lynn, Newmans. 2, J. Young, Rumblyingsyke. 3, H. M. Millan, Glasgow. 4, J. Young, Hamilton.

GAME.—1, J. & C. Sneddon, Tolleross. 2 and 3, H. L. Horne, Airdrie. 4, W. Weake, Airdrie. *Chickens*.—1, D. Ferrier, Rutherglen. 2, J. C. Sneddon. 3, W. Weake. 4, J. Gray, Gifford, Wishaw.

ANY OTHER VARIETY.—1, J. Laird, Johnstone. 2, A. W. Wylie, Jabstone. 3, J. C. Shaw, Barrhead. 4, W. Gibb, Wishaw.

BANTAMS.—*Game*.—Special and 1, G. R. Scott, Beveridge, Dunfermline. 2, J. Rouston, Rutherglen. 3, W. M. Gregor, Stonehouse, Larkhall. 4, J. Mather, Strathaven. *Any other variety*.—1 and 2, F. W. Kerr, Beith. 3, J. Wright, Ferniegate, 4, C. Gray, Wishaw.

COCKS.—1, Mrs. Alston, Craighead, Hamilton. 2, J. Meiklem. 4, J. Lightbould, Hamilton. 3, H. M. Millan, Blantyre.

SELLING CLASS.—1, G. Scott. 2, A. Youl, Airdrie. 3, H. L. Horne. 4, Mrs. Lukeman.

PIGEONS.

POUTERS.—*Black and Blue*.—1, R. Arbuckle, Parkhead, Glasgow. 2, J. Young. 3 and 4, R. Crow, Larkhall. *Any colour*.—1, W. S. M. Allister, Lanark. 2, A. Dunbeavey, Glasgow. 3, J. Cochran, Strathaven. 4, J. Forrest, Quarter.

FANTAILS.—1 and 3, J. Laird, Johnstone. 2, G. Young. 4, J. Young.

TOMBORES.—*Long-faced*.—1 and 2, J. Glen, Cambuslang. 3, W. M. Clive, Ayr. 4, J. Whiteford, Hamilton.

ANY OTHER VARIETY.—1, J. Glen. 2, J. E. Spence, Seafeld, Broughty Ferry. 3, R. Pollock, Quarter. 4, R. Crow, Larkhall.

SELLING CLASS.—1 and 2, H. C. Hinds, Hamilton. 3 and 4, J. Conkey, Darvel.

CANARIES.

YELLOW.—*Cock*.—1, J. Lindsay, Hamilton. 2, J. Cooper, Carlisle. 3, R. Pollock, Quarter. 4, J. M. Cuthin, Airdrie. *Hen*.—1, J. Graham, Trudston. 2, J. Lindsay, Hamilton. 3, W. Thomson, Hamilton. 4, T. Lidsay, Wishaw.

BUFF.—*Cock*.—1, L. Jackson, Auchinheath, Lesmahagow. 2, R. Pollock. 3, D. Gibb, Auchinheath, Lesmahagow. 4, H. Hillan, Hamilton. *Hen*.—1, J. Paton, Rutherglen. 2, J. M. Cuthin, Airdrie. 3, R. Green. 4, J. Pettigrew, Carlisle.

PHEASANTS.—*Yellow*.—*Cock*.—Special and 1, J. M. Cuthin. 2, G. Grabame, Rutherglen. 3, J. Pettigrew. 4, R. Jackson, Carlisle. *Hen*.—1, J. Pettigrew. 2, A. Moffat, Wishaw. 3, D. Gibb. 4, T. M. Millan.

PHEASANTS.—*Buff*.—*Cock*.—1, T. Newbigging, Lanark. 2, D. Gibb. 3, A. S. Barr, Glasgow. 4, J. Boyce, Hamilton. *Hen*.—1 and 3, J. Pettigrew. 2, D. Gibb. 4, J. Graham, Trudston.

GREEN AND FOUL.—*Cocks*.—1 and 3, J. Barr, Bridgeton, Glasgow. 2, J. Graham. 3, J. Boyce, Hamilton. *Hens*.—1, T. Lidsay. 2, J. Couper, Carlisle. 3, H. Hillan, Hamilton. 4, J. Lidsay.

SELLING CLASS.—1, E. Hagner, Wishaw. 2, A. Moffat. 3, J. Allison, Paisley. 4, A. Baidie, Hamilton.

GOLDFINCH MULES.—1, W. Haldstone, Airdrie. 2, J. Todd, Crossford, Lanark. 3, P. Clark, Hamilton. 4, J. Pettigrew.

RABBITS.—*Fancy*.—1, G. Cleland, Hamilton. 2, P. M. Geeban, Hamilton. 3, R. Brownlie, Hamilton. *Common*.—1, R. Frame, Hamilton. 2, R. Watta. 3, A. Thomson, Tophall, Hamilton.

CATS.—1, A. Torrance, Glasgow. 2, H. Lees, Strathaven. 3, C. Brownlie, Bent, Hamilton. 4, H. L. Horne.

JUDGES.—*Poultry*: Mr. J. Green, Glasgow; W. Pettigrew, Lesmahagow; Mr. T. M. Keane, Pollokshaws. *Pigeons*: Mr. J. Muir, Glasgow. *Canaries*: Mr. J. Gibson, Paisley; Mr. R. Pollock, Quarter; Mr. R. Pettigrew, Newarthill; Mr. W. Russell, Wishaw. *Cats and Rabbits*: Mr. A. Morrison, Glasgow.

CLARK GREEN (BATLEY) BIRD SHOW.

On the 28th ult. an All-England Exhibition of Canaries and other birds was held at Clark Green, Batley. Nearly two hundred birds were exhibited in the twenty-four classes specified. The arrangement of the catalogue was not so good as others we have seen, the classes containing the various breeds of Canaries and Mules being so mixed up. The following is the list of prizetakers in the classes, which appear somewhat different to the way the catalogue specifies them:—

BELGIANS.—*Clear or Ticked Yellow*.—1 and 2, T. M. Reid, Halifax. 3, L. Reik, Dewsbury. *Clear or Ticked Buff*.—1, J. Copley, Huddersfield. 2, T. M. Reid. 3, L. Reik.

NORWICH.—*Clear or Ticked Yellow*.—1, J. Stevens, Middleborough. 2, I. Holroyd, Bradford. 3, W. Holmes, Batley. *Clear or Ticked Buff*.—1, T. M. Reid. 2, Cleminson & Ellerton, Darlington. 3, W. Holmes.

MANCHESTER COPPY.—*Yellow, with Clear or Grey Crest*.—1, T. M. Reid. 2, J. Wilkinson, Great Horton. 3, L. Belk. *Buff, with Clear or Grey Crest*.—1, T. M. Reid. 2 and 3, L. Belk.
 PLAIN HEADS.—*Yellow, Clear, or Ticked*.—1, L. Belk. 2, P. Horne, Farsley. 3, M. Ballance, Dewsbury. *Buff, Clear, or Ticked*.—1, W. Hutton, Baildon. 2 and 3, J. Thackray, Bradford.
 YORKSHIRE.—*Clear Yellow*.—1, W. Hutton. 2, Cleminson & Ellerton. 3, J. Wilkinson. *Clear Buff*.—1, Fawcett & Anderson, Baildon. 2 and 3, J. Overend, Ravenshorpe.
 YORKSHIRE.—*Evenly-marked Yellow*.—1, L. Belk. 2, J. Thackray. 3, J. Wilkinson. *Evenly-marked Buff*.—1, S. Hainsworth. 2, J. Overend. 3, D. Hall, Buddersfield.
 LIZARDS.—*Golden-spangled*.—1, Cleminson & Ellerton. 2, M. Ballance. 3, L. Belk. *Silver-spangled*.—1, J. Stevens. 2, S. Hainsworth, Farsley. 3, T. Holroyd. 4, L. Belk; Cleminson & Ellerton; T. M. Reid (3).
 CRANFORD.—1, J. Pringle, Newcastle-on-Tyne. 2, E. Holroyd. 3, Cleminson & Ellerton. *Variegated*.—1, T. Tenniswood, Middlesbrough. 2 and 3, L. Belk.
 GREEN CANARY.—1, T. Tenniswood. 2, J. Stevens. 3, D. Gaunt.
 FINCHES.—1, J. Horne. 2, J. Overend. 3, T. Tenniswood.
 MULES.—1, J. Stevens. 2, W. Hutton. 3, T. Tenniswood.
 LINNETS.—1 and 2, J. Bage, Middlesbrough. 3, T. Tenniswood.
 LINNET MULES.—1, J. Stevens. 2, W. Hutton. 3, W. Exley.
 SELLING CLASS.—1, D. Hall. 2, J. Overend. 3, T. Tenniswood.
 BEST COMMON COTTAGE BIRD IN BATLEY.—1, T. Hall. 2, B. Aspinall. 3, J. Firth.
 JUDGE.—Mr. Harrison.

THE BAILDON PIGEON AND BIRD SHOW.—The Committee for carrying out the next annual Exhibition of Pigeons and Canaries, Mules, and British and Foreign Birds, to be held at Baildon on the 8th and 9th of January, 1875, have issued a very excellent schedule, well worthy the attention of intending exhibitors. The programme sets forth thirty-one classes for cage birds and fifteen classes for Pigeons, the prizes for which will be 15s., 10s., and 5s. each. Extra prizes will be given, consisting of a silver cup for the best competitor in the cage-bird classes, and a cruet stand to the best competitor. A silver cup and a silver medal will also be awarded to the Pigeons. Suitable pens will be provided for the Pigeons.

THE TURBIT.

The solid Turbits are of one uniform colour throughout, excepting the tail wing-bars, and hackle or neck feathers of the Blues and Silvers. They have a frill and shell-crest precisely as in shouldered birds, but are somewhat larger, and not so fine in head, beak, and gullet; except the solid White, which is equally as good as the shouldered birds in the points mentioned. They have a reddish-orange eye as in Owls. The beak in the Blue is dark, as in common Blue Pigeons. In the Black they are very light at the base, but dark at the point. In all the others the beak is light in colour. I have never seen or heard of plain Blues or Silvers without the wing-bars, and I doubt very much whether they have yet been produced. Within the past few years I have bred them of the following colourings: Blues and Silvers with black wing-bar, well-defined bar across the tail, and dark neck feathers; also plain Blacks, Reds, Yellows, Whites, and Duns. I have not yet been able to breed Blues to my satisfaction (although there are fair birds of this colour at the present time in this city), but I am in hopes of accomplishing it the present season. In my attempts to breed these birds I have at the present time one pair mated that are very poor in frill and colour, showing brown on the wing-bar. They have at this writing their second pair of young in the nest, one of which is a Yellow, and the other a clear Silver; in the first nest one is a clear Red, the other a dark Silver. I make this statement to show the importance of getting birds from a well-known strain, and also to show how they will sport in colour when not well bred, although in this case any of the young are worth more than their parents.

To further illustrate the importance of buying birds of a good strain, I will here state that in 1871 I bought a pair of solid Blacks from a dealer who is noted for pulling foul feathers (our friend Morgan's article on the Nuns had not then been published in the Journal), a habit which he had put into practice in the present case; for in a few weeks the under feathers in the tail of the female came out a pure white; but, as the sequel will show, they proved a valuable pair of birds to me. The first season they bred two pairs of Black young ones; the second season (1872) they bred Blacks, Blues, Yellows, Reds, and Duns. The next season (1873) they produced only two or three young (one of which was the brightest solid Yellow I ever owned, and at this time, 1874, is mated to one of the old Yellow stock, and is producing fine young, true to colour). While on this subject I will state that in 1872 I had one pair of solid White birds that produced in rapid succession five pairs of pure white young, all of which they raised. In the following season, as with the Blacks, they produced only two nests, only one bird of which was raised. In the first nest was one white one, and one with a large patch of drab on one side. In the next nest one was pure white as before, the other was a pure drab or light dun. This was unaccountable to me, as I had every reason to believe that the birds I had were pure-bred in every respect; but, in both cases, it will be noticed that variation in colour was produced during or immediately after excessive breeding. The

first sign of deterioration in solid Turbit is usually seen in the tail—especially with the Blues and Silvers—which will occasionally throw white feathers. I have had solid white birds breed young with smoky tails, showing plainly that at some time or other black-tailed Whites had been bred with them, or used in forming the solid bird. But these imperfections are not often seen until the latter part of the season, when the birds are weakened by breeding.

The Reda I gave up entirely, as I seldom got them to snit me, the colour being washy, with ash-coloured tails. Neither have I ever seen first-class Reda in all points; and, as a matter of course, the Yellows cannot be as fine in colour, as Yellows bred to Yellows continually will become paler in colour. This mating of Yellows has been a matter of necessity, not having good Reds to cross in, which no doubt would have helped them much.

The other colourings not yet enumerated are the solids with white tails. Of these I have had Blues, Silvers, Yellows, and Duns, and I am quite positive that Blacks and Reds could be found in this country at this time; if not, they could easily be produced. This class of birds will occasionally throw a solid colour, but the tendency is usually the other way. I have also had solid white birds with black, blue, red, and yellow tails. As far as my experience goes the white birds with coloured tails seldom breed foul birds. The two latter colourings I never faucied enough to breed them long, as the coloured tail on white birds or white tail on coloured birds always had the appearance of a defect to me—the tails not being seen except from a back view, and when seen from the front they could not be distinguished from the solid birds.—JOS. M. WADE.—(*American Fanciers' Journal*.)

[The bird above described and called the solid Turbit in contradistinction to the real Turbit—called, it appears, in America the shouldered Turbit—is a variety of Pigeon unknown in England, and likely to remain so, for I should think it would be quite undesired by English fanciers. In brief words it is an English Owl with a shell crown, that crown obtained possibly by a cross with the Nun. This solid Turbit appears to breed anything but true to colour, according to Mr. Wade's account, which is a sure sign of its being itself bastard-bred. His experience with his pair of Blacks reminds me of that of a friend of mine, who bought at a show a pair of some kind of German Toys, very correct indeed in feather, for the "gardening" had been done extensively. In a month they were much altered in plumage, and lo! they bred young ones of every variety of colour except what they were and what they ought to have been.]

The use of the word "solid" is curious, meaning whole-coloured, as different to our use of the word. There is, however, in Wiltshire a meaning attached to the word which I have never met with elsewhere: it is "steady or slow." A groom will say, if he has just given his horse a feed of cut grass and you require the steed at once, "Please, sir, let him go 'solid,' for he has just been fed."—WILTSHIRE RECTOR.]

RABBIT-KEEPING.—No. 1.

THE HUTCH I use is one of my own invention, and in simplicity and efficiency I claim that it is as near perfection as one can get in this rough-and-ready world of ours. I use two styles, one for breeding, and one for weaning.

The breeding hutch (fig. 150) is 4 feet 6 inches long, by 3 feet

Fig. 150.—Breeding House.

wide, and 6 feet high. It is four storeys high, and each storey is 18 inches from floor to ceiling; each storey is divided by a partition into two apartments—a feeding and a breeding-room. The floors are made of pine or spruce boards, tongued and grooved, well seasoned, and put together when good and dry, so that they will not shrink open.

The breeding apartment is 17 inches wide, and extends the whole depth of the hutch (3 feet); a small door is cut in the back part of the partition to allow the Rabbit to pass from one

apartment to the other. A few days before the doe kindles I place a strip of one-half-inch board, 6 inches wide and 17 inches long (see r, fig. 151), across the front end of the apartment (in grooves formed by nailing on two small strips) about 12 inches from the end; this forms the breeding-nest, 12 by 17 inches. I fill this with straw, in which the doe forms her nest. In placing this board I do not allow it to rest directly on the floor, but about three-quarters of an inch above it; the floor has a gentle descent towards the back part of the hutch. The advantages of this arrangement are—the nest being on the elevated part of the floor, all the urine drains through the straw on to the floor and out under the board, leaving the nest perfectly dry at all times; the small door (A, fig. 150) opens directly at the nest, so that the young can be easily examined at any time, and by letting the board extend about 3 ins. above the straw the young will not get out of the nest until they are old enough to take care of themselves and get back again. By placing a slide over the door (S, fig. 151) the young may be shut out of the feeding apartment while the old doe is eating her green food, too much of which is sure death to young Rabbits.

The feeding apartment is 2 feet 10 inches by 3 feet. It has a wire front (B, fig. 150), to admit sun and air. The wires are galvanised, and placed three-quarters of an inch apart to keep the young Rabbits from squeezing through and falling out. On the side in front are the doors opening into the feeding apartments through which the Rabbits are fed. (See r, fig. 150.) The floors all descend towards the back, as before mentioned, and extend out about 3 inches beyond the back side of the hutch (see r, fig. 152); the back part of the hutch is furnished with swinging doors (O, fig. 152), one opening into the breeding apartment, and forming, when closed, the back of it, and one opening into the feeding apartment, and forming, when closed, the back of that apartment. These doors do not shut down upon the floor, but when closed there is an aperture about three-quarters of an inch between the floor and the bottom of the door.

Fig. 152.—Back View of Breeding Hutch.

I claim that this hutch is self-cleaning, for the urine runs out under these doors, and the dung also is worked down the floor by the Rabbits, and falls out into the trough (H, fig. 152), which is also inclined, and leads into the pail at the end (S, fig. 152), which receives the whole and is easily emptied. A large door (N, fig. 150), made of tongued and grooved boards, swings around against the end of the hutch, when it is open in clear weather, and in stormy weather it is shut and covers up all the wire front, and keeps out the rain. I also keep it closed at night in winter. —W. F. HALLOCK, Mattituck, Suffolk Co., N.Y.—(*The American Pet Stock Bulletin*.)

THE HIVE CONTROVERSY.

"B. & W." has lately told the readers of this Journal that he expresses "only the general sense of annoyance which exists at the constant nibbling by Mr. Pettigrew at those who differ from him." Is this true, or is it not? If it is true it is high time for me to turn my attention to something else than scribbling about bees. If it is not true, there is injustice done in making the assertion. In writing I do not deal with those who differ in opinion from me; indeed, my aim is to get as far removed from them as possible. Not a word that I have written for the press for years bears the impress of snubbing or nibbling, and as to "the general sense of annoyance which exists," I may be permitted to say that it is not general, but

limited to those who differ in opinion from me. The late Mr. Woodbury was delighted to record the successes of every class of bee-keepers. I think I have abundant evidence to prove that my very humble efforts have given more satisfaction to the apirians of this country than offence, hence I have continued to write while some have been sneering at me. While they have been finding fault, hundreds, if not thousands, have been thanking me for the information given, and asking for more at the same time. The productions of my pen have been copied into many newspapers and magazines, and have been commended by about eighty of our most influential periodicals. A very large edition of my book on bees has been sold, and a new edition has been loudly called for for months. All these things are more astonishing to me than to anybody else, and I know that in mentioning them I am stooping to the weakness of egotism; but I do it to rebut the charge of being an annoyance to the public.

In seeking to advance truth or give instruction all personalities should be kept out of sight. The appearance of these is, generally speaking, an indication of an inability to uphold a cause by fact and argument. If I have ever used an unkind word or a personality in any of my published letters, I shall be glad to withdraw it. I do not remember ever mentioning even a name but in self-defence. My sole aim has been to impart information, and to help others to the formation of correct ideas in apiculture. The highest models and the greatest successes in bee-keeping that could be found in this country have been held up before the minds of the readers. By holding up these successes a great impulse has been given to apiculture, and the industry of a large section of bee-keepers has been guided.

Let me warn the apirians readers of this Journal not to confine themselves to the imitations of others. They may travel along the same road without treading in their footprints. Those who never propose to surpass are never likely to equal others. Let all have a higher ambition than to be mere followers, for those who follow are always behind. One of the greatest successes ever reached in this country that we have heard of has been accomplished this year in north-west Aberdeenshire by Ligurian bees in skeps 2 inches deeper than those I use. The gross weight gained by the hive and its colonies was 373 lbs. All honour to Mr. G. Campbell, the owner and manager of this hive.—A. PETTIGREW, Sale, Cheshire.

[This temperate and excellent letter will conclude the discussion relative to "wood versus straw" for hives. We know from letters we have received from all the disputants that they think most highly of their opponents' bee knowledge, and we are quite sure that if they could meet in our office and advance their opposed opinions by tongue instead of pen, they would shake hands and agree to differ amicably. We remember a gentleman saying in a note that another was "a donkey," and that other gentleman was deeply offended. They met, and the writer of the note said, "I did write that you are a donkey, and I think so." They shook hands, because the "donkey" said, "Now you say it pleasantly."—EDS.]

THE SLINGER.

THIS is, in our opinion, a more descriptive name for the instrument than that of "Honey-extractor," for it casts or slings honey outwards by centrifugal action. For many years I have been anxious to see one at work. Well, one that was exhibited and admired at the Crystal Palace Show has been sent here to be fairly tested. Some of the most intelligent and leading apirians in this part of the country came here to see it at work. Having plenty of hives well filled with honey, two of them were placed in ainery twenty-four hours before the time of trial. Fire was applied to the boiler of thisinery with a view to raise its temperature to 100°. The combs in the hives were thus made quite as soft, and the honey in them quite as warm and liquid, as we ever find them in strong hives in the dog days. Everything that could be done by artificial means to give the instrument a fair trial was adopted and carried into execution. The combs for experiment were uncapped—that is to say, the lids of the cells were removed, and then placed in wood-and-wire frames. Now the instrument is put in motion, and all present are anxious to see how it does its work. "Reverse the motion to empty the combs on the other side." The frames are now examined. The clover or flower honey has been slung out, or the greater part of it, but the heather honey will not go at the bidding of the slinger. The strongest arms of the strongest gentlemen present could not make the instrument cast the heather honey from the combs. The fault is not in the instrument, for it is a good one, and revolves rapidly enough; but heather honey can never be cast from combs in this way. The clover honey cast out was full of little bits of broken combs, but these were easily removed by straining the honey through thin towelling.

Some writers who are anxious to see slingers extensively used tell us that the honey obtained through them is inferior in quality to run honey. What was taken here by the slinger is

quite equal in quality to honey extracted by the old process. The honeycombs placed in the slinger were without brood, and therefore I am not able to say whether the whirling of the instrument would cast out unsealed brood as well as honey. If unsealed brood be disturbed by the whirling of the machine the honey will be very impure, and the machine itself comparatively worthless as an extractor of honey.

Being anxious to have an instrument able to extract honey from combs in a speedy and satisfactory manner, I regret that the slinger tried here has not proved itself equal to our wants and expectations. The trial here was rather disappointing to all the gentlemen present.

The patrons of the slinger take pains to inform the public that where the moveable-comb system is adopted the instrument extracts the honey without destroying the combs, thus effecting a saving of honey and preventing loss of time in comb-building. They tell us that swarms spend their first year in filling the bar frames with combs; in after years the honey is extracted by the slinger. To inexperienced bee-keepers this theory may appear reasonable and inviting. Old and successful bee-farmers are not so easily influenced; they prefer the certain to the uncertain. This morning's post brought a letter from an old and successful apiarian in Scotland, giving the results of his practice this year. He uses straw hives of considerable dimensions. One of his hives yielded four swarms. The first one rose in weight to 126 lbs., the second to 71 lbs., the third to 47 lbs., the fourth to 36 lbs., the mother hive to 93 lbs.; altogether to 373 lbs. gross. Is it possible to induce this man to abandon his mode of managing bees, which is so successful and profitable, for one that is yet uncertain and doubtful? Those who manage bees on the non-swarmling system with moveable combs have much lost ground to travel over ere they can walk side by side with this man. In bare-hunting or coursing, greyhounds are judged by their speed. In this sport there are "go-byes," "turns," and "catches." Old dogs that run often become cunning, and run second with a view to get "the catch" at "the turn." A good catch or harvest of honey is more to an old bee-farmer than anything else in apiculture.

The harvest of honey obtained from the hive and its swarms already mentioned is an extraordinary one; but swarms of 100 lbs. each at the end of the first season are becoming common, and every fine season will become more plentiful; and therefore it appears a very roundabout road to put swarms into hives with a view to get a harvest of honey from them through the slinger in the second year of their existence. This is mentioned with a view to ask the readers of this Journal to consider how black and tough combs are after two years' use for breeding purposes. The slinger is introduced on purpose to preserve such combs. We think combs are quite old enough at the end of their second year. At that age they are, generally speaking, not only black and tough but pollen-bound—that is to say, their centre parts are clogged with bee bread. The bees cannot find empty cells for the eggs laid by the queens. We hold that the preservation of old combs in hives is neither wise nor profitable. Bees thrive better and gather more honey in combs young and sweet than they do in combs two years old. A swarm put into a hive in May will fill it with combs and gather more honey in a good season than any kind of hive managed on the non-swarmling system. The ventilation of this subject is at the present time of great importance to the thinking and intelligent bee-keepers of England, and its consideration may make some of them hesitate before they purchase slingers for casting honey out of combs too old for keeping, and young combs are rather too tender and easily broken for the machine. I look at the question broadly and without a shade of prejudice, and thus looking at it cannot see that apiculture will gain much by the introduction and use of the American slinger. I fancy that one trial will be enough for bee-farmers and cottagers.

Honey-taking is not pleasant employment, and many advanced bee-keepers would be gratified and thankful if some of our inventive apiarians would set themselves to the task of producing an instrument for extracting honey from combs speedily. The preservation of combs should not be considered. The combs of a large hive yield about 5s. worth of wax; this sum would buy sugar enough for a large swarm, and which, if properly given, would enable the bees to fill an ordinary bar-frame hive or a 16-inch straw one with combs, and store up food enough for themselves from September till March. What advantage, then, can be found in the use of old combs? Most certainly there can be no gain or profit in their retention. Lately we called on an able apiarian who showed us about a dozen of good stocks, three of which were sugar-fed, and one of these is a bar-framer, the other two being 16-inch straw hives. The bar-frames had been partially filled with secondhand combs in the way shown at the Crystal Palace. The syrup was stored in the combs without any additions being made to them. The combs in the straw ones had been built wholly from the syrup, and nearly filled all the spaces. I valued the straw stocks at 10s. a-piece higher than the bar-framer, the combs of which had been taken from other hives and strapped in. In conclusion, I ask the readers of this

Journal to think calmly on, and take a comprehensive view of, the questions discussed in this letter, for it is very important for bee-keepers seeking profit to adopt and keep the right path.—A. PETTIGREW.

OUR LETTER BOX.

BIRMINGHAM POULTRY SHOW.—"You state that my first-prize Partridge Cochon pullets should have been in the adult class. Allow me to say that your opinion is entirely wrong, one of them having been hatched on the 9th of April, and has never been exhibited before; the other was hatched on the 23rd of February, and was exhibited once previously—viz., in the chicken class at Southport in August last.—T. STRETCH, *Ormeau*."

SPOTS IN CARRIERS' EYES (*Subscriber*).—Carriers as to their wattles are highly artificial birds, and a wide departure in any way from nature's type causes a liability to disease. The immediate cause may be a light or cold draught, then comes a running; and a fold of the wattle becomes literally a spout to carry off that running, and mischief soon grows. Cut off the spouts—and mind and cut low enough—with a sharp pair of scissors, and then after bathing the eye and the blood ceasing, put on a little cold cream or any grease that has no salt in it. Put more grease on for a few days, and the wound will soon heal. Watch your bird carefully lest he get any injury, and of course separate him from others.

BEE-KEEPING.—The interesting notes of "P. H. P." and others are unavoidably deferred to next week.

BELGIAN HARE RABBIT (*G. H. R.*).—The small spot would not disqualify it.

METEOROLOGICAL OBSERVATIONS,

CAMPDEN SQUARE, LONDON.

Lat. 51° 32' 40" N.; Long. 0° 8' 0" W.; Altitude, 111 feet.

DATE.		9 A.M.					IN THE DAY.					Rain.

REMARKS.

2nd.—Fine frosty day throughout.
3rd.—Very slight frost all day, but rather warmer at night.
4th.—Hazy morning, damp and dull, though not rainy; wind high at night.
5th.—Another damp dull day; much warmer towards night.
6th.—Rainy all day, at times heavy rain; high wind and heavy rain for a few minutes about 5.15 P.M.
7th.—Very bright and fine all day, but with a cold frosty wind all day; bright starlight night.
8th.—A decidedly rainy and uncomfortable day, not a glimpse of the sun, but continued drizzle, with heavy rain at times. Barometer falling rapidly at night, and high wind.
A wet, windy, winter week.—G. J. SYMONS.

COVENT GARDEN MARKET.—DECEMBER 9.

WE continue well supplied, and the demand remains moderate, so that scarcely any advance can be looked for at present; a week may make some difference. A fine parcel of St. Michael Pines is to hand, and will be offered at auction in the latter part of the week. Apples of English growth reach us by heavy consignments from the western counties, realising from 2s. 6d. to 4s. the bushel. Potato trade heavy, large arrivals. Cornish Broccoli good.

From observations taken near London during forty-three years, the average day temperature of the week is 44.0°; and its night temperature 33.1.

THE YEAR AND ITS LESSONS.

AS the last month of the year opens upon us the tendency of one's mind is naturally retrospective; and as each month passes in review, many matters recur to memory which one would like to have told long ago to the readers of the Journal, but could not for lack of time, for the whole year has been a busy one; and I have no doubt that if some of the pages of my horticultural diary were transcribed literally into the Journal many youthful aspirants would be much surprised to find how numerous and varied are the matters apart from actual gardening with which one has to deal in the management of a new place. On the first page of that diary I read, "The new year opens cheerfully with a warm bright day;" and this hopeful and promising aspect which Nature wore when the year was young was prophetic of the prosperity which has crowned its span of time. Some hopes remain unrealised, and some expectations unfulfilled; the sunshine has not been unchequered by clouds, but there has been no settled gloom; brightness has predominated, so that on the whole the year has been a prosperous and in some respects a remarkable one.

A winter of extraordinary mildness was followed by some severe late frosts which were fatal to fruit prospects in many districts. A drought early and long continued, an autumn of genial showers, and weather so mild that beds of Calceolarias, and even Heliotropes, were perfectly full of fine fresh blossom in the last week of October, and another winter of mild open weather, comprise the chief weather-characteristics. The mild winter caused many hardy plants to become so tender that the cold spring proved fatal to them, teaching us to be on our guard, and ready with such means of protection as can be had so as to counteract the baneful effects of such unseasonable weather as much as possible. Some spring-flowering plants, notably Nemophila, are extremely liable to suffer from such weather, especially when planted on a flat surface. High-raised beds with a steeply-sloping surface, soil of a dry, gritty, open texture, and thin planting is the best remedy. Spring-flowering plants, especially annuals, should never be crowded together in winter; each plant should stand tolerably clear from its neighbour, so as to be fully exposed to the play of light and air; then in spring the sturdy plants, growing freely, quickly blend into a perfect mass without a scar or blemish.

Among vegetables, Peas are more generally regarded than any other as the prime esculent of summer. The first sowings were made on February 3rd of Dillistone's Early and Laxton's Alpha, from which the first gatherings were made on the 30th of May, the first-named kind affording double the quantity of plump pods that day to what could be found upon Alpha. A fortnightly sowing followed the first one until the middle of June, when the regular cropping ceased. An abundant and constant supply of nice young Peas was forthcoming from the first gathering until the early part of October, or nearly five

months. A speculative sowing on July 1st of Laxton's Omega, William the First, and Carter's G. F. Wilson proved most interesting and useful. William the First may be an excellent early variety, but it is comparatively useless so late in the season. The seed vegetated with surprising rapidity; the haulm was decaying and the crop fully matured long before that of the other two kinds was fit for table. Omega is a good kind, yielding a fair crop of large pods well filled with very green Peas, but, in my opinion, it was much inferior to G. F. Wilson; this is worthy of note, because especial merit is claimed for Omega as a late Pea. Growing side by side with it, and under precisely the same conditions, G. F. Wilson was more robust, much less affected with mildew—of which, in fact, it had very little—and yielding a crop which was greatly superior both in size and quantity. The great value of such late-sown Peas is seen by a reference to the kitchen book, which shows that good dishes of Peas were sent to table on October the 11th, 15th, 19th, and 22nd. Depend upon it, good late Peas are quite as valuable as early ones. Reverting to the general Pea crop, it should be stated that the June sowings were all of Veitch's Perfection, which if sown in the second or third week of that month come into use in August, and continue good throughout September. Knowing this, one takes especial care to make these sowings quite three times as extensive as the ordinary ones. For example, if two rows were required in May, six would be the correct proportion for June.

Turning now to Kidney Beans, sowing a row or two thickly and transplanting was adopted throughout the season; it is an excellent plan, by which a supply of plants can always easily be had to follow or put between the rows of any other crop. For forcing, and for early or late crops, a new kind called Osborn's New Early Forcing proves a real acquisition. The growth is remarkably dwarf and compact, the crop is abundant and fit for use much sooner than other kinds. It is quite the best for pot culture, the compact dwarf growth requiring no supports, and occupying very little space. Among climbing Beans special attention should be directed to Carter's Mont d'Or Butter Bean, a delicious vegetable, greatly superior in quality to all other climbing Beans. The old Scarlet Runner is sometimes disliked, and there are establishments where Dwarf Kidney Beans only are cultivated for the dining-room. While strongly recommending this new introduction to all, I would specially beg those having charge of gardens where this feeling prevails to grow some of this fine new Bean, as it must become a general favourite.

Of Onions we have a new Neapolitan white-skinned variety called Queen, which proves most valuable for early spring or autumn sowing. It is of remarkably quick growth, being fit for use much earlier than any other kind that has been grown with it. Sowings of it made in July and August form a capital succession to the summer Onions.

Much attention has been given to salading of all kinds, particularly in providing a winter supply, but the un-

usually mild autumn almost upset all one's plans. A fine large batch of Cos Lettuce, sown July 16th, were in excellent condition—that is to say, they were fit to use when transplanted to the frames October 5th; but the whole of them ran to seed, and have been replaced with Stanstead Park Cabbage Lettuce, which under ordinary circumstances would not have been fit for use till spring. Some "All the Year Round" Cabbage Lettuce put in frames at the same time as the Cos are still good, so that in future one will be inclined to depend more upon Cabbage Lettuce for winter salads. Many useful crops of Cabbage Lettuce were obtained in summer by sowing single rows thinly between Celery, dwarf Peas, or upon any bare narrow spaces, such stolen crops proving especially valuable for kitchen purposes; for when *Monsieur le Chef* demands "much *laitue*" the order must be interpreted largely. The general crop of Celery is this season confined to Leicester Red, which is in my opinion superior to all others. Certainly the immense bulk of the solid plants place it very high for stewing and other culinary purposes, and the delicacy and crisp tenderness of the hearts is all that can be wished.

Among Melons grown in ordinary garden boxes upon dung beds Dr. Hogg was decidedly best. It was most prolific, each successive crop yielding an abundant supply of handsome medium-sized fruit of an average weight of 2 to 3 lbs., and of excellent flavour. Little Heath Melon did not answer my expectations. It certainly swells to an enormous size, but it was quite second-rate in flavour.

A few plants of the later introductions among Cucumbers, such as Blue Gown and Marquis of Lorne, were grown, the fruit making a fine display; but for all practical purposes the preference must still be given to Telegraph and Masters' Prolific.

Tomatoes were grown entirely in pots in a pit; they were kept by pinching to the form of compact bushes, and sustained in full vigour by a free use of liquid manure. The crops were abundant and fine. Hepper's Goliath was very fine, the fruit being much larger than any other kind, and remarkably handsome. Hathaway's Excelsior, too, was grown in quantity; it is a prolific sort, and the profusion of round and perfectly smooth fruit which it yields renders it very desirable, especially for small gardens. A crop of ripe Tomatoes cannot always be obtained from plants grown entirely in the open air. In a cold wet summer dark blotches and specks appear upon the fruit, which then soon becomes rotten; and therefore, while some plants are usually planted in the open garden, care is taken to provide a regular supply from pot plants. There are very few gardens where at least some pot plants might not always be managed by plunging the pots in the open air, and removing a few under glass occasionally—in fact, I am by no means sure that this is not the best plant for general adoption, as the plants answer equally well in the open air as under glass in the early summer months, and require much less care and attention.

These brief notes, be it remembered, refer to a climate about fifty miles south of London, and so are not closely applicable to the northern counties, from whence it would be interesting to see similar communications.—EDWARD LUCKENRST.

GLADIOLUS CULTURE.

The following notes are by Mr. Sampson, of the Preston Road Nurseries, Yeovil, whose varieties have attained considerable distinction:—

When to Plant.—The best time to plant is in the month of March, commencing quite early in the month if the weather be at all favourable. In order to secure an effective display, and at the same time afford the plants an opportunity of fully developing the beauty of their flowers, they should be planted in beds, which should be formed in rows not less than 18 inches apart, with a clear space of a foot between each bulb in the line. Some cultivators have recommended potting the bulbs and growing them on for a time before transplanting them in the open ground, but concurrent testimony proves that no advantage is derived from it. Some have recommended planting in January and February, but it is best done in March; but if a few late flowers are required, the planting of some of the bulbs may be deferred till the middle of April.

The Preparation of the Soil.—A deep loam best suits the Gladiolus, and the bed in which the roots are to be planted should be previously well trenched to the depth of 18 inches, digging-in at the same time a good dressing of well-decomposed manure. Thoroughly rotten vegetable refuse and wood ashes, as well as some crushed bones, greatly assist the de-

velopment of the plants. As soon as the growth begins to appear through the soil I put on the surface of the beds a thin dressing of condensed night soil, increasing the quantity as the plants mature their growth, and the height of summer is reached.

Summer Treatment.—This includes keeping the beds clear of weeds, and occasionally stirring the surface soil. When the flower stems reach a foot in height, each should be tied to a stake to support it and preserve it from harm through winds which are apt to twist the stems off close to the bulbs. In dry weather frequent sprinklings overhead and good surface-waterings will be necessary, but the dressing of night soil will do much to keep the bed moist and cool. In tying-out to the stakes be careful not to tie the stem too tightly, sufficient space should be allowed to admit of a free upward growth.

Taking-up and Storing the Bulbs.—The taking-up and storing of the bulbs is a matter of considerable importance, and the removal of the bulbs from the beds should not be deferred till the stalks die-down completely. It is best to lift them when the leaves turn yellow, and cut away the stems to within 6 inches of the bulbs, and these to be placed in a cool airy place to dry. They should then be put in drawers, baskets, or bags in a moderately cool and dry place, each variety being kept separate and distinct. Frost must be guarded against; a severe frost will cause many of the bulbs to rot. In such a place the bulbs can remain till planting-time comes round again.

Raising Seedlings.—Seed saved from the best varieties may be sown early in April, either in pans or shallow boxes, or in nicely-prepared soil in the open ground. When the plants begin to show themselves they should be encouraged with a little weak manure water occasionally administered. When large enough to be transplanted, they should be planted-out in beds about 4 inches apart each way in some good light soil, and encouraged to make all the growth possible during the season. A good number of the bulbs will flower the following summer.

ERYTHRINA CRISTA-GALLI AND ERYTHRINA HERBACEA.

I AM pleased to see Mr. Giles call attention to this fine old plant, *Crista-galli*, which, as he justly observes, is seldom met with now-a-days, and but rarely as it used to be in times long since gone by, for in the early years of the first gardening periodical, "The Magazine," it was thought a great feat to flower it three times in a year—i.e., the same plant, and some very fast ones asserted it was possible to do more than this; but assuming the ordinary cultivator to be satisfied with doing so once, and giving it a fair chance to succeed, few plants repay the trouble better. Yet, somehow, it is not often met with in a good condition, and as reports of ill success are often as interesting as the contrary, I confess not having been at all so lucky with it as I expected; but my object has mostly been to have it do well as an outdoor plant, and at various times the last twenty years have planted out a good many plants with only indifferent success, and losing a good many of them, owing, perhaps, to the aversion I have to see anything covered-up in winter, which is the time when the appearance of the grounds is of most importance; and of those who did survive, their flowering fell below what I expected of them. Nevertheless, treated something like *Dahlia*s, I have seen them very fine, and we all know how much better the foliage looks outdoors than inside, where red spider seizes them as its legitimate prey. The best plants, I think, I ever remember seeing under glass were placed on stands raised level with a large basin of water, in which they were placed, just like what we sometimes see done with Pitcher-plants or aquatics. The vapour from the water kept the red spider more at bay than any other mode of treatment I have ever seen them subjected to; still it existed. But it is needless enlarging on this head, but I would like to know if anyone has discovered any peculiarity in the soil in which this plant seems more to delight in than others, and if so, what is it?

Furthermore, I would ask if any of your readers have the smaller species of this genus, *E. herbacea*, as it used to be called nearly half a century ago, a species resembling the other in every respect, except being 2 feet high? I cannot call to memory having ever seen it since the time when the agitation for the first Reform Bill was going on, when it was a favourite, and deservedly so, and widely distinct from

E. Crista-galli; while I hardly think the one called *E. laurifolia* sufficiently distinct to be entitled to a botanical place, but only to be such a sport as most seedlings are now and then liable to run into. I may further add, as supplementing Mr. Giles's remarks on the cultivation of this plant, that it is most easily propagated from seed; it may also be struck from cuttings, but to endeavour to do so from the old ripened stems, cut into lengths like what is done with Vines, was a puzzling matter to the last generation of gardeners. I content myself with seeds.—J. ROBSON.

EVERGREEN HEDGES.

It is sometimes desirable to form a hedge to separate two portions of a garden or kept grounds, or to serve as a screen by which one portion may be completely shut-out of view from the other. For this purpose it is evident that such a hedge or partition should be made with evergreen plants compact and neat in habit, and permitting free use of the knife or shears, both for improving the appearance of the hedge and for keeping it within the required limits of height and width. The formation of hedges, directions for planting them, the materials suitable for the purpose, and their after-treatment, have been discussed in these pages before, although a long time has since elapsed, but not so exhaustively, if I remember aright, as to include every case that may arise. A revival of the subject, therefore, will not be deemed inopportune or unnecessary, especially as many plants of easy propagation have of late come under notice as being suitable subjects for the purpose under discussion, and which by this time have probably been to greater or less extent applied to it. To elicit the experience so far as yet ascertained of those readers of THE JOURNAL OF HORTICULTURE who will kindly furnish it, of any evergreen, whether coniferous or otherwise, that they have used, or seen used, to form neat and picturesque hedges or partitions in kept grounds, is the object of the present article.

Evergreen hedges are common enough, but how few and often indifferent are the materials of which they are formed. Excepting the Holly and Yew, which require a long time to form really serviceable and impervious screens, we rarely meet with evergreen hedges formed with any other plant than the common Laurel, and occasionally the Portugal. The common *Arbor-Vitæ* (*Thuja occidentalis*), is sometimes used, but by no means so generally as it might and ought to be. Anyone who has seen the magnificent hedges of *Arbor-Vitæ*, Holly, and Yew at Knap Hill or Piltown cannot fail to have admired them.

With the variety of plants suitable for the purpose now procurable, and the evident superiority of some of them over the few, excepting the Holly, that have hitherto been employed, it is quite clear some improvement in this direction may be effected, for the question is not one of boundary fences or of defensive hedges, a purpose for which the Hawthorn with its dense plexus is still unsurpassed in this country. The chief objections against the common Laurel are—it takes up too much room, its foliage although cheerful is too large and sparse, its leaves are shed at a season when of all times it is most desirable that the garden should be as free from litter as possible. Its rapidity of growth is counterbalanced by equally rapid decay, especially at bottom, causing unsightly gaps, which necessitate a cutting-down of part or the whole plant or hedge to induce new growth from the ground. The Yew forms a massive and dense screen of indefinite permanence, admirably suited for nursery purposes, but too sombre for the garden unless strongly contrasted with its surroundings. The *Arbor-Vitæ* (*Thuja occidentalis*), is excellent, but becomes discoloured in winter. Undoubtedly the Holly is one of the best of plants for forming a picturesque hedge, and the more so if budded or grafted the third or fourth year after being planted with the many pretty variegated forms in cultivation. Its slow growth is an obstacle to the ease I am now supposing, to form a screen that shall be at once effective, or become so within a short period.

We must, therefore, turn to the Conifers for the material we seek. *Thuja gigantea* (sometimes known as *T. Lobbi*), would be superior to *T. occidentalis* from its verdant appearance at all seasons. *Cupressus Lawsoniana*, now one of the commonest, but at the same time one of the most elegant as well as most hardy of Conifers, appears to be well adapted for this purpose. A nurseryman of great experience stated to me that it was too thin; further evidence is much wanted. *Thuja*

plicata is a compact and erect plant, but less cheerful than *T. gigantea*. *Biota orientalis* on soils not too light forms an erect and dense plant. If this has been tried (and it is worth a trial), it is necessary to know if cutting causes the plant to remain thick at bottom, where it generally becomes thin when allowed to grow without check. *Juniperus chinensis* flourishes on almost any soil and bears close cutting.

The above-named Conifers are suggested for screens and hedges of any height up to 12 or even 15 feet. If a much lower height is all that is required, as 5 feet, there are several useful and hardy evergreen shrubs that might safely be tried. For light foliage, *Buxus balearica* and some of the forms of *B. sempervirens*; for dark, *Phillyrea latifolia* and *P. boxifolia*, *Euonymus japonicus* (green variety); the others cannot be depended upon in very severe winters. Intermediate is *Viburnum Tinus* and *Ligustrum ovalifolium* (Oval-leaved Privet), a stronger species than the common Privet and evergreen, which the common kind can hardly be considered. A picturesque hedge could be formed with a judicious intermixture of all these, and they are all patient of the shears and become dense after being clipped.—A. H. KENT.

LIFTING AND ROOT-PRUNING FRUIT TREES.

No. 7.

WE have trees of Peaches, Nectarines, Apricots, and Plums which in three years after planting will have grown, according to the soil and treatment, much and barren, moderately and fruiting or promising to bear, and little having small weak growths which promise greatly for fruit, usually ending in mere blossom. There is a poverty which ends in a sheet of bloom but no fruit, and there is growth which promises nothing beyond it. The one is as unprofitable as the other, and the remedy is the same for both, but applied in a different manner. For the stunted subject the proper remedy is to lift with every particle of root, and plant in richer soil, and only moderately firm, the tree being young. It will slowly but surely become invigorated. The vigorous subject will, say if three years planted, require to have a trench taken out 3 feet from the stem all round and as deeply as the roots, cutting off every root at 2 feet 6 inches from the stem, or, if very vigorous and if against a wall, 3 feet; so for a pyramid or bush, 2 feet for a very vigorous tree, and 1 foot 6 inches for a vigorous one. Removing the loose soil down to the roots, lift with the ball as entire as practicable; put in some soil where the roots were and tread or ram hard, raising so that the setting-on of the roots will, when the tree is placed in position, be just level with the surrounding ground. Fill-in with soil, adding a fourth of manure to it, and tread hard. If dry give a good watering, forming the soil into a dish so that the lifted part may receive the water; and when it has settled in level mulch for 3 feet round with only partially decayed manure, the roots to be covered about 3 inches deep with soil. The best time to lift is when the leaves begin to fall.

Trees which are vigorous and tending to fruitfulness are best left alone. To lift them would only be to make them fruit more and grow less, which is hardly desirable until they have covered their allotted space or are as large as desired.

Trees which are large and unfruitful from, it may be, age induced by poverty of soil or a system of treatment which aims at the restraining of the vigour and inducing of fruitfulness, weak and small parts though numerous are produced, resulting in crowding masses of bloom being produced, there being twenty or more of bloom to one of wood buds, the branches long and bare of bearing wood—the trees being vigorous in some parts only, and there mildew appears; whilst dying branches with an ugly tree and small fruit—dry and mealy instead of large and juicy—usually show poverty to be the cause of such indifferent results. Many in such a case, and especially a young hand, consider resuscitation hopeless, and so root out the trees, which may cover a space which will require seven years for young trees to gain, and that time to give as much fruit as the old renovated will in one year. Many a man has been turned out of a good situation for no other reason than he has shown himself of too enterprising a spirit for the old-fashioned groove in which his employer's ideas have been running. Want of "digging about and dunging" weakly fruit trees, especially Peaches, Nectarines, and sometimes Apricots and Plums, which, though twenty or more years planted, are not old, but the cropping and treatment to which they have been subjected make them barren, has led to much of their failure in many places where they formerly

succeeded. Anyone, therefore, who may have fruit trees large and weak in growth, productive of abundant bloom and spurs in fruit, and what there is poor, will be doing themselves and the trees a service by at once setting about an alteration. It does not matter how old they are and weak, the change for the better will be all the more marked after the operation's beneficial results appear.

Ascertaining by actual measurement the square feet covered by the branches sideways and high, take one-third those as the distance from the stem to open-out a trench, and go down beyond the depth of all roots. This done, all roots being cut off—if the object be to lift them, as we will presume it is, the trees being in the worst possible condition as regards weak old bare wood, and dying parts, and probably low—remove all soil to the roots with a fork, and freeing them of the loose soil without injury to the fibres, and then working underneath (the roots from the trench to the stem of the tree having been loosened from the wall), may be lifted with the soil adhering to the roots, and having some soil placed under where it was, and so much as will bring the setting-on of its roots level with the surrounding surface, which soil should be turfy loam with a fourth of cow or rotted manure intermixed, or, if the loam be not turfy, one-third manure to be added to it; and whatever the soil added be, it should be fresh, thoroughly incorporated with the dung, and beneath the tree be rammed as hard as a much-frequented road. The tree, returned to its position, is to have the soil worked-in between the roots where any soil has fallen from them, and should be fresh-manured soil, and trod firmly and the full extent of the space opened out. After planting a good watering to be given, and finally mulched with littersy manure. The branches ought to be secured to the wall to prevent injury from winds, or if in the open, as may happen with Plums, staking them securely. Avoid covering the roots near the stem deeply, and not more anywhere than 6 inches—better if only 3 inches, whilst close to the stem they need only be just covered. We leave the subjects until February, for the lifting should be performed so soon as the first leaves have fallen and the others likely in a short time to follow; and then set about removing the weak, old, and long bare shoots or branches from the Peaches and Nectarines, disposing the main branches at a foot distance apart, and, if they are not present, seek by cutting back to originate them from as low down as possible, and arrange to have the bearing wood at a foot distance apart along them. It may be we cut away half the tree, but the parts only that disappoint if left, as they have done before, and complete by properly securing to the wall. We have to be careful to water during any dry weather after the middle of May up to the same time in August, and use the garden engine frequently to distribute water over the foliage, which is good for keeping the soil moist along the wall, it very often being dry as a desert, and for cleansing the trees of insects, to say nothing of its affording means of moisture being given off by the wall to the benefit of the trees for a long time afterwards, thereby conducing to their health and vigour. In watering, it is no use to water beyond the radius of the trench; and as the roots will be all there give enough to soak it through, for dribbles may do to prolong life and cause necessity for frequent repetition, but are practically valueless for growth. In autumn we may have a tree that has ripened off a fair crop of fine fruit (considering the lifting), and a promise of an abundant one next season. But we must not rest content, for contentment means a return in no great length of time to an enfeebled tree and discontent from the imperfections of the growths and fruits. We must follow up what is begun, beginning where leaving off; and just outside the trench taken out the year before take out another, and 2 feet wide and as deeply as the roots, and joining the other, which will be found filled with roots, and it may be seeking, and perhaps attained, access to the old soil. This trench to be filled-in as the first with fresh and manured soil, and the space from it to the stem mulched with littersy manure. Each year we add a width of fresh ground for the trees until the whole is completed, and then manure by the surface.

Plums and Apricots, bearing for the main part on spurs, are not to have the branches thinned, but the spurs may be shortened and thinned in February, and in other respects treated the same as the Peaches, only for them the soil need not be made so firm. The trees not being bad in branches, but producing poor fruit, or none, but with abundant bloom, and having many branches or a multiplicity of spurs, lifting will be unnecessary, as it is evident all that is wanted is more

vigour. This may be accomplished in two ways: First, by manuring at the surface, which is of little use if the border be heavily cropped with vegetables, the trees being made secondary to them, and thinning-out the old, bare, and weak wood of Peaches, and the spurs and even branches, if they be crowded, of Apricots and Plums. This enriching of the soil without disturbing the border much should begin at the stem, for the Plum stock is never short of ramifications there; therefore loosen and remove the soil there and add fresh soil enriched with manure, manuring the border and just pointing-in. The border, if the soil be light, should be firmed, and it is likely the roots will be attracted upward, as they will certainly be multiplied and extended from the stem outward by the manure and fresh soil, to which we may attribute any benefit that may arise. The treatment must be followed up each year, and may effect a change for the better, as each year the cultivation is continued, instead of that niggardly policy which expends nothing upon the trees, and those that are so unfortunate as attend their pruning, &c., but grumbling over disappointments of which they are the originators. Secondly, by adopting a more radical change in the conditions of the trees' roots, or the means from which they derive support for and fashion the head. At the stem commence operations by removing the soil with a fork, and clear away the soil down to the roots, and work outward, continuing the fork until it is safe from the depth of the roots to employ a spade, and clearing all away either as far as the roots extend, or at least half the extent of root-surface or the extent of branches, and then commence lifting the roots if they are deeper than a foot from the surface, and by removing the soil between them they may be raised tolerably easy, and as each root is raised pack under fresh and manured soil, bringing the roots as near 6 inches of the surface as can be done without damaging them, and consolidate the soil under, around, and over them; and as those near the stem may not be raised, remove the soil between them and replace by fresh, and make firm, completing by a mulching of littersy manure after giving a good watering if the weather be dry and the trees are not devoid of leaves. If the roots are near the surface, the surface being cleared of the soil down to the roots, remove from between them and under them as much as possible, and replace it by fresh compost and ram firmly, taking care that there are no vacuums, but all alike made solid under, between, and over the roots, not covering deeper than 6 inches, and at the stem not more than 3 inches, finishing with a firm surface and a mulching not more than 3 inches thick of littersy manure. The thinning of the branches, shortening of long bare ones, thinning the spurs as before stated, and otherwise attending to watering, syringing, and seeking a good and healthful growth, and afterwards manuring annually more or less as the growth and crop prompt, giving it liberally if they grow but weakly and fruit heavily, and less proportionately as they make strong growths and tend to barrenness. A return to barrenness from overcropping, overrated growth, and overproduction of bloom buds without corresponding wood ones, is as much to be shunned as gross and sappy growths. Thinning the fruiting parts will remove the first evil, whilst over-vigour is only to be subdued by curtailing the feeding medium by operating upon the roots in a manner ensuring of slow growth, close-jointed, well-ripened wood. Old trees, however, rarely need any haggling at their roots, but, as a rule, need its opposite, amply repaying any "dugging" the cultivator may bestow. Many old trees—not from age, but hard usage and ill fare—now enabled only to give a return for it in blossom, would do so in fine and abundant fruit were they kindly treated, their wants for fruit-production suitably considered and given.—G. ABBEY.

CHRYSANTHEMUMS.

I wish to draw attention to the magnificent display of Chrysanthemums to be seen at Berkswell Hall, the seat of T. Walker, Esq., near Coventry. Happening to call there a few days ago I was very much struck with the display in the fine conservatory of that flower when cultivated as Mr. Downe the gardener there does, both as regards size of flower, form, and quantity on each plant, many both of large and small-flowering sorts having from 100 to 150 finely-developed flowers open on a plant at one time, of all the most approved varieties. The plants are well trained, but not stiffly, many of them as standards on stems from 2 feet to 5 feet high, and with heads from 4 feet to 6 feet through, which has a grand effect among a host of other autumn-flowering plants. It never has been

my lot to witness such a fine lot of Chrysanthemums at any of our autumn shows either in London or the provinces, all are so healthy, and their large green leaves far below the rim of their pots, which are not very large for the size of the plants.

Mr. Downs has been in T. Walker, Esq.'s, family for a quarter of a century as head gardener. He does not exhibit.

The names of some of the most prominent varieties I noticed were Queen of England, Empress of India, Prince of Wales, Prince Alfred, Princess Beatrice, Bovela, Venus, Mary Morgan, John Salter, Lady Talford, Lady Slade, Jardin des Plantes, Bronze Jardin, Guernsey Nugget, Mrs. G. Rundell, and Lady Harding.—J. G. T.

SEA-KALE AND HORSE RADISH CULTURE.

SOME few weeks ago a correspondent in your Journal gave a few excellent hints about Sea-kale. I have practised a similar mode of cultivation for a few years with good results. I think it is folly to have a great space of ground planted with Sea-kale 3 or 4 feet between the rows for forcing on the ground, when double the quantity can be grown on the same space to be forced indoors.

For these last two years I have practised the same annual routine of culture on Horseradish, and find it succeed perfectly. As soon as the leaves are off the plants in October or November we take out a trench at one end of the bed, as is usual in ordinary trenching, and by means of fork and spade turn over the whole of the bed down to the clay, carefully picking out the roots as whole as possible, and manuring as the process goes on. The bed is then made level ready for replanting. The roots are then looked over; all that is fit for kitchen use are dressed and laid aside for that purpose, and all the long thin roots of the thickness of a quill stripped of all side roots are laid in bundles for replanting. With a long dibber (or an ordinary Dahlia stick will do), make holes 18 inches or 2 feet deep, 6 inches apart, and 1 foot between the rows. Into each of these holes we drop one of these long roots, and then fill the hole up with fine dry soil from under the potting bench. These make nice useable roots the first season, but of course if they were left for two seasons they would be much better. This annual planting has many advantages. In the first place, a very small bed will grow sufficient for the supply of most families. This struck me very forcibly on entering a very old kitchen garden a few months ago, where was to be seen a bed of Horseradish some 15 yards long by 5 or 6 wide, which apparently had not been disturbed, except in digging roots up for use, for fifteen or twenty years. In contrast to this we have dug from a bed 15 feet by 8 sufficient good roots to supply an ordinary family for twelve months. In the second place, the ground is being cultivated. It is annually improving; and the plants being in rows, it can be kept clean by means of hoeing, the same as any other crops, instead of becoming a nest of weeds, as is too often the case; for it is no uncommon thing to find weeds seeding in the Horseradish bed at places where they would not be tolerated anywhere else. In the third place, there is no such thing as shouldering a pick when grim John Frost resists the spade in the gloomy winter months. The roots are laid regular in layers one above another with soil between, covered over with soil. A little litter keeps out frost and mice. It is always accessible without the aid of either pick or spade. Would anyone who is acquainted with the system practised by those who grow it for the market favour us with an outline of their mode of producing the fine clean roots which they send to market?—R. INGLIS.

CHESTNUT TIMBER.

THERE is evidently a confusion of ideas in the extract from the "Household Guide," given at page 346.

The timber and the fruit of the Spanish Chestnut are as distinct as possible from that of the Horse Chestnut. The wood of the latter is white and soft; that of the former so much the colour and character of Oak as to be not easily distinguishable from it. I have more than once heard a timber merchant say he had sold Spanish Chestnut for Oak. It is generally considered a durable and valuable wood. My experience certainly does not agree with that of "A CORRESPONDENT," page 425. I have now some boards out of the butt of a fine Spanish Chestnut which had not a flaw or crack about it. These boards were selected for their superior quality for carving purposes.

There have been some articles lately in the Journal on the comparative merits of Strawberries. Some kinds are represented as worthless grown in one place, and everything to be wished grown in another. What "A CORRESPONDENT" says of the Spanish Chestnut wood I could say very much of some Oak, fallen and cut up where I am writing. There is no doubt that soil and situation materially affects the growth and quality of timber; and under certain conditions of situation and growth trees become "shaken" or "rifted;" the seams may, and do often, become completely obliterated, and the timber proves what "A CORRESPONDENT" describes the Chestnut. The old story of the chameleon will apply.—V.

ARRANGING FLOWERS.

ONE can scarcely be engaged in any pursuit more interesting or that requires more study than that of arranging flowers; indeed it is nothing less than an art that few have thoroughly mastered; many have laboured to attain it without any very great success. It seems almost, I think, like many other branches of art—many will try, but few will attain the height to which they aim. We may with perseverance attain much—with strict attention to natural laws and determined patience may almost mount the pinnacle of perfection; but how slow and often discouraging to one that is not really talented for the particular object that is wished to excel in. One has often more than enough at times to dishearten when, just as we think we at last have dropped in the right path to reach the top, alas! to our mortification only to find another with that particular vein of taste to drop in and deprive us of what we have been labouring for with great hopes, and I may say certainly of obtaining. Well, there is no help for it. It is only vexing to think those parties have only just made the fresh attempt, and then that to bring them to the height we have worked so long to obtain. What a revolution has of late years been wrought in the arrangement of flowers by prizes offered at the various horticultural societies! We all rejoice of this: where is the one that would like to drop back to the middle ages of dark heavy formality? Gratified though we are by natural and becoming changes with the professional classes, I must drop a step lower to find the height of my pleasure in the great change worked and working in the ranks of the sinew of old England, the working class. They always did love flowers; they are now, thanks to the many cottagers' societies, coming to think them a part of that stupendous whole that make up a happy existence. Much, very much, is left to be done by the above societies to improve the arrangement of flowers by their exhibitions.

Having been for a few years rather out of the line of attending any cottagers' exhibition in England, I was wont to tell those that had sprung up around me how much better they did things, not in France, but in England. Judge of my surprise when attending a show or two in this neighbourhood to find the arrangement of flowers still in all gaudy colours, still that heavy, lifeless, and unnatural cramming all that hand can lay hold of—all this with the hope that the more staring and clumsy the mass the greater the chance of a prize. My experience convinces me that the most direct way to assist the better arrangement of flowers, is for ladies and professionals to arrange some specimens with precisely the same variety of flowers as the cottager; and (though example is better than precept), I believe a few words in criticising those shown, and to explain what would be an improvement, are equally calculated to foster a better taste in the exhibitors.

I had in my mind when I began this note two instances of the effect of taste in arrangement of flowers, though they were both seen in cottages, humble but clean and happy I'll vow. Those two specimens have very often presented themselves to my mind, especially when arranging stands, and I believe much to my edification. The first a large pie-dish filled well up to a mound with nice green moss. What need we better for the foundation for a beautiful graceful arrangement? As it was, little were really wanted. Well, in this moss were studded in as thick as possible very fair Asters and Dahlias. Here the arrangement ended. We could be but pleased even to see this; and as we always do, we showed our pleasure by congratulating the hand that did it, &c. It was a well-meant beginning, and we suggested fewer flowers of more distinct colours with that little addition of gracefully-placed Fern leaves, Grasses, and a few small flowers to stand out and from the more heavy Dahlias and Asters which are best as a groundwork.

We should have passed this, no doubt, with no more than a pleasant thought; but it so happened a few hours after to find ourselves admiring the arrangement of a stand of flowers in another cottager's abode of a very different character. Its simplicity, its gracefulness struck us how erroneous it is to think a mass of showy flowers are necessary to form a pleasing group. In this stand it was not the material but the method that made it so pleasing. It contained but little from the garden but just a Rose bud or two, Mignonette, Sweet Pea, and a Geranium or two; the rest were from everybody's garden—the hedge. This the arranger had dealt unsparingly with, and right well were they arranged with the garden flowers. I still see the beautiful hues of the Bramble leaves, the Grasses and Ferns with a few wild flowers and berries, of which the wild Rose's haws and the pink Comfrey stood out most tellingly. What a difference one had presented in these two arrangements—one flat and heavy, the other light and springy. The one induced but a glance, and the eye seemed to require no more; the other, the more one viewed it the more one wished to do so. But here is the point I wish to conclude with: The first party had never seen an exhibition of arranged flowers, there were no cottagers' societies in her neighbourhood; the other had seen and exhibited in one. Never was I so convinced of the benefits those societies do, when well conducted, than in the last few years in Carmarthenshire.—JOHN TAYLOR, *Hardwicke Grange.*

SOME OF THE VEGETABLE PRODUCTS OF CEYLON.—No. 4.

MAIZE OR INDIAN CORN.—This most valuable grain thrives well in the greater portion of the island. As Mr. Sharpe most truly remarks, that considering how well Indian Corn thrives in Ceylon generally, and how wholesome and nutritious a grain it is, ranking unquestionably among the first of cereals, the extension of the cultivation is every way to be desired. Its growth might be indefinitely extended, while the value of the produce, as an article of diet substituted for or alternating with Rice, cannot be over-estimated. In some of the elevated regions of the central province it grows luxuriantly, as it does in the lowlands, so that it would seem adapted to every variation of climate experienced in the island. As a vegetable the young cobs when boiled are excellent, and the fried corn is by no means to be despised. Cakes prepared from the flour are very palatable and wholesome. In North America, from the torrid to the temperate zone, this cereal is a most important article of diet.

The extension of the cultivation of Maize and the improvement of the Grasses of the colony would, specially through the agency of small Chinese and other farmers and stock-raisers, do much to improve the existing cattle, sheep, and poultry; and for such produce the town and port of Galle in the southern province of the island, and of Colombo in the western province, the places of call for so many large steamers with very numerous passengers for continental India, China, and Australia, &c., would present admirable markets for its disposal, besides the large demand within the colony.

VANILLA.—Much attention is being paid by my friend the able Director of the Royal Botanical Gardens in Ceylon (Dr. Thwaites), to the cultivation of this valuable plant, and different modes of growing it are being tried. Dr. Thwaites thinks the best system to follow is to train the plants upon strong trellises, to which it firmly attaches itself by means of its aerial roots, as the plants appear to be much more manageable under this treatment, and it thrives quite as well upon the trellises as when it is growing upon the trunks of living trees. Much care is being bestowed upon the curing of the Vanilla pods, so as to prepare them in the style required for the European markets, and is adapted in the Isle of Réunion. Vanilla is indigenous to Nicaragua in Central America. The pods when they become yellow are placed in heaps for a few days to ferment, afterwards flattened by the hand, and carefully rubbed with cocconut oil, and then packed in dry Mountain leaves, so as to confine their powerful aromatic odour. In a note I have before me from a competent authority, to whom I sent a sample of Ceylon Vanilla to be reported upon, it is stated that the quality is considered very good, although it wanted more colour. To make it obtain the highest market price, the pods ought to be large and quite black. The best pods of the sample were considered to be worth 70s. per lb.; the lowest 50s. per lb. If sent for the London markets, it is recommended that it should be packed in tinfoil and done up

in half-pound packets, and then enclosed in tins containing 6 or 7 lbs. each.

Dr. Thwaites is of opinion, as Vanilla is so easy of cultivation in parts of Ceylon, that if only a comparatively small price is obtained for it in Europe such would cover the cost of labour.—E. RAWDON POWER, *Ceylon Civil Service (Retired), Tenby, South Wales.*

NEW HORTICULTURAL CLUB.

In answer to numerous inquiries addressed to me privately, and which I may take as an indication that others would like the same information which I have given to them, will you kindly permit me to say that the only reason why more active steps have not been taken in bringing the Club more prominently before the general body of horticulturists, is that we have so far been completely baffled in our attempt to find suitable accommodation, and that we are desirous, before issuing any further statement, to be able to say that we can offer our friends the full benefit of membership? The very cordial manner in which the proposition has been welcomed by representative men in the various branches of horticulture, leads the Committee to believe that when we have completed our arrangements we shall be enabled to establish the Club on a satisfactory and permanent basis.—THE SECRETARY.

GARDENING IN INDIA.

ENGLISHMEN introduce their recreations wherever they migrate to. The first morning after my arrival at Calcutta I met an old friend at a cricket match, though the temperature was so high that it was played at sunrise. So have they overcome difficulties of climate and cultivate European garden plants.

Dr. Spry, the indefatigable Secretary of the Agricultural Society, published at the close of 1841, "Suggestions for Extending the Cultivation and Introduction of Useful and Ornamental Plants, for the Improvement of the Agricultural and Commercial Resources of India." It is full of highly interesting and important information.

Anyone placed amid plants and vegetables exhibited annually at the Agricultural Society's Show, would not guess that the vegetables there collected were the produce of Calcutta gardens, cultivated by native mallees.

There are Celery, Cabbages (Red, Drumhead, and Savoy), Spinach, Turnips, French Beans, Endive, Carrots, Lettuce, Red Beet, Artichokes, Potatoes, Tomatoes, Peas, Cauliflowers, Watercresses, &c., that would not shame an English gardener at Fulham.

Now that railways have facilitated journeying to northern India, the neighbourhood of the Himalaya Mountains is more than ever a region of resort during the hot season. There, with air cooled by the snows eternally crowning the highest elevations of the world, one mountain rising to 29,000 feet, the climate is peculiarly suited to the culture of European fruits and vegetables. Bungalows—villas we should call them in England—have multiplied; and one town, Simla, having a resident population of six thousand, and full twelve thousand more as visitors, has gardens numerous enough to support a professional whose card is now before me, and may be useful for reference to some of your readers, so I copy it:—"H. Bwyne, Practical Gardener, Seedsman, and Florist, Collector of Coniferae and other Seeds, Simla, Punjab, India. Plans designed and prepared for the laying-out and improvement of gardens; the erection of horticultural buildings, and work relative to horticulture undertaken."—G.

NOTES AND GLEANINGS.

At a recent meeting of the Philadelphia Academy of Natural Sciences, Mr. Thomas Meehan referred to a former communication in which he exhibited specimens of *EUPHORBIA CORDATA*, or *E. UNMISTATA*, collected by him in the Rocky Mountains, and which, normally procumbent, had assumed an erect habit on being attacked by a fungus *Ecidium Euphorbiae hypericifoliae*. He now found that the common trailing *Euphorbia* of our section, *E. maculata*, when attacked by the same fungus, assumed the same erect habit. There was an additional interest in this observation, from the fact that with change of habit of growth there was a whole change in specific character in the direction of *E. hypericifolia*. In a comparison of the leading characters of the two species, we

see that in *E. maculata* there is a profusely hairy stem, while that of *E. hypericifolia* is nearly smooth. The same is true of the fruit. The leaves of the former species are very oblique at the base, the latter nearly regular. The flowers are produced in all the axils. In the *E. hypericifolia* the stems have a tendency to be nodose at the joints, while *E. maculata* is nearly free from this character, and the flowers are mainly in heads at the ends of the branches. The *E. maculata* after the fungoid attack becoming erect, also becomes nodose, and has the flowers on the ends of the comparatively smooth branchlets, while the leaves have lost their pointed obliquity; and, in short, all the characters make an intermediate between the two species. He said it would not be fair to assume, from these facts, that *Euphorbia hypericifolia* was an evolution from *E. maculata*, but, as there could be no doubt that nutrition was one of the factors in the government of form, we could say that certain phases of nutrition brought about by an attack of a minute fungus would change the characters to the direction of those in that species.

EXTRACTING LARCH CONE SEEDS.

In answer to "B. B.," the best way to extract the seeds from Larch or any of the Fir cones, is to gather them in summer, put them loosely in sacks, and lay on a moderately heated fire, turning them two or three times a-day until they begin to open, then place on sheets full in the sun for a few days, taking them in at night to some dry place. The seeds will easily come out by slightly heating them with a stick.—S. TAYLOR, *Castlecroft*.

NOTES ON VILLA AND SUBURBAN GARDENING.

A Hotbed and its Management.—At this dull time of the year, and duller still in gardening matters so far as the amateur is concerned, who, as many of them have gardens, but no glass houses, and just a few frames or a pit, which afford the means of doing a little forcing provided the necessary material can be found. Where this can be done, and their fancy leads them to the cultivation of early Cucumbers, let me remind them that this is now the time to set about the work, because the collecting of manure and the necessary preparation will take some time, and at this slack time of the year such time can be better afforded than at any other. Procuring the materials may be to many a very difficult part of the business, inasmuch if they are not made on the premises it has to be purchased. But let us make the matter as easy as we can by saying that it is not necessary that the bed should be made up of pure horse manure only, but it is beneficial as a moderator of heat to add quite one-third of fresh leaves from the trees; Oak leaves if possible, they being more lasting, especially if added in a dry state. However, many a hotbed is made without any addition to the manure, and very well they answer if done properly. In provincial towns leaves may many times be procured for the work of collecting or for a very trifling amount by purchase. First of all it is better to decide about the frame, whether a single light or double one. I advise the latter if sufficient material can be got together and ensured, not only for the bed proper, but also for the after-work of linings, &c. As at this early time of the year the bed will need to be when made up quite 4 feet 6 inches high at the back, and 3 feet 6 inches at the front, and as the materials first heated as they ought to be before making up, and all the rank heat sweated out of it, will reduce the bulk quite one-half, an idea will be given as to the necessary quantity for the first start. About twice a-week, if the material is in heating condition, it will need turning over, and each time it ought to be turned inside out and well mixed, and it may be a fortnight before it is ready. But I must first mention that before the turning commences the necessary quantity must be got together, as it does not answer to continue adding fresh and rank manure to that half-prepared. The bed will be much longer in becoming sweet by that plan, and some of the material will be too far gone for use.

Now we come to the making of the bed; and this should be placed in a sheltered yet sunny spot, but not on a wet cold bottom of earth. Either the bottom must be raised up by a foot of rubble for drainage or a layer of rough wood a foot thick, covered over with rough litter before the bed is made up. This plan is a wonderful help to the bed in retaining its heat, and also a good medium for drainage. Set out the bed 6 inches wider than the frames on all sides, and build it up firm by beating down with the fork as the work goes on, but it is not to be trodden. When all is done place the frame upon it, and shut it up till the steam and heat begins to rise, and then let out three or four times a-day by opening the light about an inch, not more, or the heat will not rise gradually, as the bed will receive

a check. Perhaps a week will be needed to ascertain the heating power of the bed. Beds are liable to become too hot, or there may be a little rank heat to get rid of before further proceeding. However, when the heat can be ensured at about 90° without fear of becoming hotter, the soil may be put in, and this no more than a couple of bushels in the centre of each light thrown in a heap. This soil should be a mixture of turfy loam one-half, and leaf soil and rotten manure one-quarter each. When this becomes warmed through sow a few seeds in a pot, and plunge it in the soil, or sow the seeds in the soil itself, they will soon be up; however, let them remain till the rough leaf appears, then pull all out except one plant to each light, or take them up and pot them to provide against future wants. Keep the temperature at night as near 70° as possible; and as they grow the white roots will be seen at the outside of the soil, then it is necessary to add a few inches of soil, and proceed in this way till the plants grow large enough to peg down and stop, when the bed may be finished off by soiling-down. I ought to say that the precaution should be taken to warm the soil before taking it to the frame, otherwise it lowers the temperature to such an extent that is not easily recovered. The same whenever water is applied. As time goes on, and the heat cools down too low, linings of manure should be applied; but if the weather is mild, only back and front at first, and the next time the two beds may be done. This will, perhaps, be a better guarantee for a uniform temperature. Besides the night heat here stated above, one of 50° in the day by sun heat and air will cause them to thrive. Now, a bed of this kind requires constant watching. If it is put up in an exposed place, and a windy night occurs, the heat is blown entirely out of the bed, or perhaps to one part of it, when in a mild day it would become too hot, and perhaps burn the roots of the plant. Again, sometimes it happens that after the bed is made up, and the plants growing, the bed suddenly becomes too hot. At such a time, if the weather is so cold as to preclude air-giving, the sides have to be pierced with a pole in several places to let the heat out, and at nights it is always necessary to cover up the frame little or much, according to the weather. So that those who pride themselves in growing Cucumbers by dung heat must make up their minds to pay them every attention in order to be successful.

I mentioned in the early part of this paper that I admired a double-light frame, I will now state my reasons. Towards mid-summer, when the plants of this first crop shows signs of exhaustion, one light can be cleared out to the bottom of the bed—that is, manure as well as soil, and a fresh lot put in the same condition as before, and treated the same in turn; the soil is put on, and the plants, which should be previously prepared, planted out from their pots. The light is divided off by boards, and treated as a separate frame. In time the other light is served in the same way, and so a succession of Cucumbers is kept up by this system in a very satisfactory way. It may be said that when one light is cleared out the roots of those plants in the opposite light must be cut, and it is true they are; but I have never known them to show any injury from it, and I have often practised the plan. The system can be recommended to those with small conveniences, and that is my reason for naming it. Last year I knew an amateur who followed it up, and, besides supplying his own table, sold enough Cucumbers to pay for the manure and his trouble throughout the summer. I believe he has already collected his materials for a bed on the same plan.

Now there are many sorts of Cucumbers to be had, most of them good for particular purposes, but not hardy enough in constitution to be recommended to an amateur with such conveniences as I have described. I therefore take this opportunity to state that one of the best Cucumbers—I may say the best sort I have ever found, and I have tried many—is Coolin's Derbyshire Hero. This will be found a real amateur's Cucumber, for it grows from 15 to 18 inches in length, is very prolific, a vigorous grower, with a hardy constitution, just the thing for a frame, and outdoor beds also. I make up a bed outdoors every year, and plant it out, and treat it the same as the ridge Cucumbers, and it is thoroughly satisfactory. Those who knew Leslie's Long Ridge Cucumber, and as it was, will, I believe, find its superior in the one I recommend.—THOMAS RECORD.

LOUGHCREW.

THE SEAT OF J. L. NAPER, ESQ.

WHEN London published his celebrated "Encyclopedia of Gardening," he said of Loughcrew that "it gave every promise of magnificence." The promises have been amply fulfilled. In every department—the garden, farm, plantations, and general keeping of the estate, it is superior to most country residences in Ireland, and inferior to very few. There is a unique completeness about all its arrangements which is seldom met with. Each department is carried out extensively, and the work well done. You can see good farming and good gardening—prime stock and well-stocked preserves. Few Irish

gardens have made a better mark in the horticultural world, and the young men trained there are to be found in every direction near and far. Its fame in stock-breeding is not less well-established, as the annals of the Irish societies testify; whilst home-sport is sedulously cared for in its well-filled preserves, and the thousands of pheasants reared here annually. All this is done with the strictest order and neatness, and these desirable accompaniments are not less observable even on the outlying portions of the property occupied by tenants and labourers. This is a gratifying fact; for, unfortunately, we oftener find lying in close proximity in this country luxury and squalor, order and disorder, than is at all desirable. It is, however, with the gardens I intend more particularly to deal. I had the pleasure of looking over them lately with the efficient gardener, Mr. R. Burns, just before the late spell of bad weather, and it was certainly a treat not to be forgotten. I had frequently seen Loughcrew before, but I doubt if I ever saw it, particularly in the flower-garden department, come so near absolute perfection. It will not therefore, I trust, tire your readers to give as brief a *résumé* as possible of the most noteworthy features.

By the way, an important fact to sight-seers, Loughcrew is easily reached. It is a great drawback to many of our best

is an oval, exceedingly well arranged indeed, with a circle at either end. The end beds are planted in concentric circles, the centre being *Abutilon Thompsonii*, the outer ring dark *Heliotrope*. The planting of the oval being a much more complicated affair, I enclose a sketch (fig. 155), numbering the beds and their occupants, which will, I trust, convey a clearer impression than a mere description in words. The *Coleus* was beautifully coloured, and as regular in height as if run in a mould; whilst the pretty little *Alternanthera* and *Lobelia pumila* filled the outer curves to perfection.

Passing the end of the house the flower garden lies stretched before us. It is a snuk or panel garden the whole length of the mansion, and of a considerable breadth. A terrace and broad gravel walk run round on three sides, with a more elevated terrace at the further end, which is backed-up with a fine conservatory. A walk leading from where the mansion opens on the parterre cuts the flower garden in two, and midway sweeps round an ornamental fountain. The present flower garden is comparatively new, being entirely the work of the present gardener, Mr. R. Burns, and totally different from the old flower garden which existed when he came there. It does him infinite credit, and this season in every detail it

| 2. <i>Sempervivum californicum</i> . | 5. <i>Mesembryanthemum cordifolium</i> |
| 3. <i>Alternanthera amabilis</i> . | var. |

places being situated in backward localities—they are not easily got at. The Dublin and Drogheda Railway runs to Oldcastle, from which, if young and active, a walk of two miles will take you to your destination; if not, cars are always to be obtained at the station. And the scenery is some of the finest; certainly nothing like it in Meath. The country is bold and hilly, yet, being so judiciously planted by the late Mr. Naper, looks neither bleak nor barren. Some of the hills attain a considerable height, and on a range of these overlooking the mansion and grounds excavations were made a few years since at Mr. Naper's expense, and conducted by a competent antiquarian, which led to the most interesting results. Should the visitor be a student of archaeology, a trip to the hills will be at once pleasurable and profitable, whilst to anyone the vast view to be obtained will well repay the trouble of the ascent.

The mansion is approached, going direct from Oldeastle, by a broad and well-kept drive, with a handsome lodge in cut stone, and some neat flower beds in front. There are two other beautiful entrances, one with a very elegant rustic lodge, and which skirts an imposing piece of water as it approaches the mansion. The house is of the Grecian order, and built exclusively, as well as the offices and stabling attached to the courtyard, of the finest cut stone. The front is supported by a long sweep of terraces kept closely shaven, and at the end and rear is situated the flower garden, to which we will first direct our attention.

Entering by a neat gate we find on our left, immediately under the end windows of the house, three very pretty beds, whether we regard the arrangement of colours or the suitable adaptation of the plants as to size and habit. The centre bed

Lobelia, plant for plant. | 2. Golden Feather. |
|--|--------------------|

came as near perfection as possible. Here again the *Coleus* did admirably. Some of the Golden-bronze Geraniums made splendid beds, of which I may particularly mention Lady Cullum, Her Majesty, and Kentish Hero. The beds were planted in the following manner:—

- | | |
|---|---|
| 1.—Geranium Snowflake, edged with <i>Lobelia pumila</i> . | 3.—Geranium Gloire de Corbeney. |
| 2.—Geranium Lady Cullum. | 4.—Geranium Golden Cerise. |
| 5.—Pink Pelargonium Illustration. | 6.—Centre, <i>Abutilon Thompsonii</i> ; Pelargonium Waltham Seedling. |
| 7.—Lord Palmerston. | 8.—Her Majesty. |
| 9.—Centre, <i>Coleus Verschaffelti</i> ; Pelargonium Countess of Warwick; Cerastium. | 10.—Pelargonium Kentish Hero. |
| 11.—Duchess of Sutherland. | 12.—Centre, <i>Abutilon Thompsonii</i> ; Pelargonium Black Dwarf. |
| 13.—Pink Pelargonium Madame Barre. | 14.—Golden Cerise. |
| 15.—Pelargonium Emile Lican. | 16.—Sunset. |
| 17.—Fairy Nymph, edged with <i>Lobelia pumila</i> . | 18.—Jean Sisley centre, then Dance Bijou, edged with <i>Ageratum Tom Thunb.</i> |
| 19.—Centre, <i>Coleus Verschaffelti</i> , surrounded by a star of Golden Feather; outer segments, <i>Lobelia pumila</i> . | 20.—Same as 19. |
| 21.—Victor Millet, edged with Crystal Palace Gem. | 22.—Illustration, edged with Little David. |
| 23.—Lady Plymouth, with Iresine dotted through | 24.—William Underwood, edged with Crystal Palace Gem. |
| 25.—Madame Barre, edged with Little David. | A.— <i>Cineraria maritima</i> , bordered with <i>Lobelia pumila</i> . |
| B.—Dark <i>Heliotrope</i> , bordered with Golden Thyme. | C.— <i>Polenonium coruleum</i> , bordered with <i>Lobelia pumila</i> . |
| D.— <i>Ageratum Imperial Dwarf</i> , bordered with Golden Chain P. | E.— <i>Iresine Lindeni</i> , bordered with Mangles' Variegated. |
| F.— <i>Centaurea candidissima</i> , bordered with <i>Lobelia</i> . | |

On the terrace next the house are four beds which deserve especial mention, as they are models of elegance and taste. They are oblong beds, and planted as in the annexed illustration. The combination of Lady Plymouth with *Lobelia* has a pleasing and chaste effect, but the other bed should be seen to be justly appreciated. It abundantly proves that in this country at least gardeners should depend for colour more on foliage than bloom, and it was instructive to see how beautiful and fresh this bed looked dressed with its *Sempervivums* and *Alternantheras*, although the season was drawing to a close when I saw it. The conservatory at the extreme end of the flower garden is well stocked with the things usually found in such structures, with fine specimens of *Cyathes dealbata*,

Dicksonia, Pteris scaberula, and two fine Filmy Ferns, Todea pellucida and Trichomanes radicans.

Around the mansion, by the drives, and through the dressed grounds which intervene between the kitchen and flower garden, are scattered many fine specimen trees and shrubs. Of these I may particularly mention the fine row of Irish Yews, and nice examples of Cupressus Lawsoniana, Wellingtonia gigantea, Pinus Picea, Nordmanniana, Abies Douglasii, and Cryptomeria Lobbii. The kitchen and fruit gardens, which contain somewhere about five Irish acres, are situated a considerable distance from the residence and completely out of view. As we approach these the style of gardening assumes, and properly so, a transitional character, forming a natural and connecting link between the stiff lines and gorgeous colouring of the parterre we have just left, and the more humble beauties of the other garden. The exterior of the garden wall is clothed with the usual things employed for that purpose—Roses, Magnolias, Wistarias, &c. A strip of ground in front is kept in short grass planted with ornamental shrubs,

through which are dotted a few beds very appropriately planted. One in particular I admired extremely at once for its simplicity and richness. It was a circular bed filled with alternate plants of Variegated Maize and Chilian Beet. This had quite a sub-tropical effect, and the Beet was the best coloured I ever saw. Mr. Burns told me it was a peculiar strain sent out by Messrs. Tait & Co., of Dublin, and although the Beet is by no means a favourite of mine, I must say that if it could be always got so well coloured, it could be turned to much account in our gardens. Entering by a fine ornamental gate the kitchen and fruit gardens, we stand at once in front of those borders, which years ago when ribboning was in its infancy and all the "rage," were the wonder of this part of the world. They are no longer planted in that fashion, but they are, nevertheless, very effective. The borders remain as formerly with the well-known hedge at the back of each, and which threw into such glorious relief the long lines of glowing colour. At present they are planted as mixed borders, having a row of Hollyhocks at the back, with

Fig. 155.

1. Iresine Lindenii.
2. Coleus Verschaffeltii.

3. Cerastium tomentosum.
4. Mesembryanthemum cordifolium.

5. Lobelia pumila grandiflora.
6. Alternanthera amabilis.

a plant of Tait's Chilian Beet between each. The remainder of the borders is filled with an immense variety of bedding Geraniums, Violas, &c., most of them new and rare kinds. Among them was a white-flowered variegated Geranium—Victor Millet, Vesuvius, Mrs. Mappin; and of Violas, some of them very pretty, Blue King, The Tory, Advancer, Dickson's Golden Gem, Vanguard, &c. Next the gate as we enter, and formed by a bend in the hedge, are two small beds very beautifully planted. At the back is Dell's Beet, then Golden Feather, then Tropaeolum Cooperi, and in front Ageratum Tom Thumb. The border is divided midway by the intersection of two walks, with a dial occupying the central space. Here, again, by a bend in the hedge, are formed two small curved beds, and these are planted with several varieties of Bicolor and Bronze Geraniums, at once for the purpose of ornament and comparison. Amongst the best of these I noted Prima Donna, Sybil, Princess of Wales, Goldfinder, C. H. Wills, Waltham Bronze, one of the best; Reine Victoria, &c. From this the border continues in a straight line to the top of the garden, where it is terminated by a neat structure, filled at the time of my visit by a nice collection of Camellias.

To say that fruits and vegetables were well and largely grown would be superfluous, or that the cleanliness and keeping were all that could be desired.

The division containing the several ranges of houses is separated by a wall from this, and entering at the top or highest point the first we meet is a fine lean-to some 116 feet long and 8 feet wide. This is devoted almost exclusively to Peach and Nectarine culture, and though most of the fruit was gone at the date of my visit, enough remained to show that the crop must have been first-rate, whilst the health and condition of the trees were all that could be desired. The principal Peaches grown were Noblesse, Late Admirable, Walburton Late Admirable, Bellegarde, Salway, Galande, Early Mignonne, Acton Scott, Early Grosse Mignonne, and Elruge Nectarine. A fine Brown Ischia Fig, carrying a fine crop, occupies one end of the house, and a number of Tomatoes in pots are grown in front. The Peaches and Nectarines are grown on the back wall.

The next range of houses are late vineries. Here the crop was very fine indeed, particularly Muscat Hamburgh, which is frequently found so hard to manage. This is inarched on a

seedling Vine, and was giving complete satisfaction. The second house contained Barbarossa, carrying bunches quite 2 feet in length; Black Hamburg, White Lady Downe's, Black Alicante, really splendid; and Duchess of Buccleuch, finer than I thought it could possibly be grown. A similar range of houses consisted of an early house quite cut away, and a Muscat house. The early house was planted with Black Hamburg, Muscat Hamburg, and Buckland Sweetwater. The Muscat, which was still carrying some fine fruit, consisted principally of Muscat of Alexandria, Muscat Escholata, Barnes' Muscat, and Bowood Muscat.

The next range, which may be called the greenhouses, is in three divisions: one filled with the newer varieties of *Coleus*, *Amaranthus salicifolius* well grown and very ornamental, *Alternanthera paronychoides* major, &c.; another devoted to *Fuchsias*; and the third filled with a choice collection of greenhouse plants, many of them noble specimens. Amongst the most remarkable were the following:—*Acacia Drummondii*, *Adenandra speciosa*, *Rhynchospermum jasminoides*, *Pleroma elegans*, *Erica depressa*, *Cavendishii*, and *jasminiflora alba*, with *Genetilis tulipifera* and *fuchsoides*. Next comes a stove in two divisions, well filled with the usual tenants of such structures. It would quite unnecessarily extend this article to give a detailed list, so I will content myself by saying that the following were particularly noticeable—*Anthurium Scherzerianum*, *Bougainvillea glabra*, *Pandanus Veitchii*, *Gardenia Stanleyana*, *Clorodendron Balfourii*, and the pretty little *Urceolina aurea*. Here were also very fine plants of *Eucharis amazonica*, *Stephanotis floribunda*, and *Eranthemum leucocervum*.

The next range we enter is a propagating house in three divisions, efficiently arranged and heated. Two of these divisions were literally filled with a beautiful and healthy stock of young plants in different degrees of development—fine-foliaged and ornamental stove plants and Ferns. Particularly noticeable were *Maranta hieroglyphica* and *Palicourea discolor*. The third division had just been planted with *Sion House* Cucumber for winter use.

Retracing our steps a little we next come to a house devoted to the growth of fine-foliaged plants, and which contains the gems of the whole collection. They are really beautiful, and evidence the highest cultural skill and care. To be rightly appreciated they should be seen. Here we have the pretty *Acalypha tricolor*, *Alocasia gigantea*, *Jenningsii*, &c.; *Crotons pictum*, *undulatum*, *Weismanni*, and many others; *Dieffenbachia Barranquiana* and *variegata*, *Dracaena Cooperi*, *gracilis*, *Gulfordii*, &c.; *Hibiscus fol. variegata*; *Maranta* beautifully done, including among others the following—*alba lineata*, *Makoyana*, *Vanden Heckeii*, *tubispatha*, *Warszewiczii*, and *Veitchii*; *Peperomia argyrea*, and *Sanchezia nobilis variegata*. Adjacent is a fernery, not very extensive, but containing some fine Ferns and Mosses. Among the former I may mention the lovely *Adiantum Farleyense*, *Veitchii*, and *tinctum*; *Blechnum boreocandense*, *Lomaria gibba*, and *Trichomanes radicans*.

The lower portion of the ground is occupied by pits and frames, which, when I saw them, were filled with *Roses*, *Chrysanthemums*, *Cinerarias*, *Primulas*, *Cyclamens*, and a host of things useful for the winter and spring decoration of the mansion and greenhouse. Amongst other things Mr. Burns was growing largely a *Campanula*, which he calls *media calycanthema alba*, for this purpose. Here was also being struck in boxes the immense stock of bedding stuff required for so extensive a place, and which appeared to be just making themselves at home in their new quarters. This brings us to the garden gate. There is a still lower stretch of ground in which are situated the Melon and Cucumber frames for summer work, the reserve grounds, young men's houses, offices, &c. And so having spent a very pleasant, and I trust profitable, day, I bade goodbye to Mr. Burns, and turned my back on Lougherew. If the recollection of my visit has interested even a few readers, I am repaid.—EXCELSIOR.

[We hoped to add a view of the gardens, but the photograph sent to us is not suitable for wood engraving. We have a ground plan of the garden, but it is too large and elaborate to be reduced to the size of a page; we are obliged, therefore, to be contented with three of the beds and their arrangements.]

DOINGS OF THE LAST AND PRESENT WEEKS.

A CORRESPONDENT recently alluded to the fact that failures occurred in large as well as small gardens. Many years ago an intimate friend, who was acquainted in some way with the

details of the management of one of the largest gardens in England, stated that it would quite surprise those whose only knowledge of gardening had been gained in small or medium-sized gardens if they were made acquainted with the failures and mistakes made in the one to which he alluded. We would fancy that in the smaller gardens there would be less probability of mistakes being made or failures taking place if the person in charge does not attempt too much with the limited means usually at his command. We have known gentlemen who expected their gardener to grow Pines, Vines, Cucumbers, and Melons in one house; but a gardener who would undertake to do this would have himself to blame if he failed either to satisfy his employer or gain credit to himself. Many of the owners of small gardens also on first taking to gardening are very enthusiastic; they run hither and thither, and whatever they fancy in other people's gardens they would like to try in their own. They try everything, but have not perseverance enough to do anything well, and failing in their expectations on all hands they give it up in disgust. But mark the successful man, and the one who seldom has any failures to chronicle. He has a passion, shall we call it, for, say, *Roses*, and whether the soil of his garden is unsuitable or not, *Roses* he must and will have; and after he has surmounted every obstacle that was opposed to his success, he will not stop there, but will add some other class of plant, and yet another, and another, until, step by step, he becomes a successful gardener. And how is this success attained? Simply by patient and laborious work and study. Whatever is undertaken is done with the intention of being thoroughly investigated. The plants or fruits are watched daily, and if anything is amiss it is quickly detected, and immediate steps taken to set the wrong right. Then books, weekly papers, and monthly periodicals are read and re-read; a wrinkle is gained here and another there, so that every hour of well-directed study lends its quota to complete the ultimate success. In small gardens, where the head gardener can do much of the work with his own hands, and where but little of his time is taken up superintending others, he ought to present better examples of good culture than the man whose time is wholly given to overseeing.

The weather has been very changeable during the last week, and all out-of-door operations have been much retarded, owing to alternate days of frost, thaw, and rainfall. The farmers also complain of the difficulty they have to get the seed Wheat into the ground in good order.

The only work we have been enabled to do in the

KITCHEN AND FRUIT GARDEN

has been to prune Currant and Gooseberry bushes; they are all trained in the bush form, which is the most natural and that most frequently adopted. The system of pruning is easily understood, even by those who have had but little experience. All the young wood is spurred closely back, leaving only the buds that cluster together thickly at the base. Any young wood that is required to fill up has the points merely taken off on the Gooseberry bushes. The young wood on the Currants at the extremity of the branches is cut back much closer to the old wood. If the young wood of the previous year is, say, 18 inches long, two-thirds of this ought to be removed. But Gooseberry and Currant bushes are amenable to almost any system of training, and one of the prettiest sights to be seen in the kitchen gardens at Ashridge, under the care of Mr. Sage, is a row or two of espalier-trained Gooseberry bushes, and the method of training is as simple as it is pretty. A number of horizontal growths are trained right and left from an upright leading shoot. As the leading growths are trained to the horizontal wires side shoots are freely produced, which are annually spurred back until the cordon bristles with fruit buds, and the fruit clusters on the whole length of the branch like strings of Onions. We also wheeled a good dressing of manure on to the Asparagus. The usual method of treating this crop is to dress the beds with manure now, and by forking up the alleys between the beds in the spring sufficient soil is obtained to cover a portion of the manure, some of it being dug into the alleys to replace the soil that is taken out. In our case the Asparagus was planted in rows, and the crowns are not deep enough in the ground, so that we will wheel some spare soil on to the quarter and quite cover the manure with it.

Pine Houses.—The principal thing to be guarded against here is undue excitement. We have a few fruits awelling slowly in the fruiting house, but the night temperature is not over 60°; and even if the sun should occasionally peer out it has little effect on the glass, so that the temperature by day is seldom more than 5° higher. To force the plants on in a high temperature under such circumstances can only cause a weakly growth, which future good management would scarcely set right. After Christmas, with the lengthening days and more brilliant sunshine, the temperature can be increased 5°. It is still necessary to damp the paths, walls, &c., of the house once a day if the weather is cloudy and dull, in drying frosty weather twice a day. Nor do we neglect to give air daily, just a very little at the apex of the roof. The plants will not require any water

except under exceptional circumstances during the next eight weeks.

Cucumber House.—The present is the most trying period of the whole year for the occupants of this structure, and success can only be assured by careful management. The first essential is to maintain a suitable temperature without requiring to overheat the hot-water pipes. In the house under our care, even in severe frosts the thermometer seldom falls below 60°, the usual minimum being 65° with the usual rise by day, which at present is seldom more than 5°. Cleanliness is next. Even under the most favourable circumstances the plants will not thrive if insect pests are allowed to breed upon them; thrips, red spider, and green fly are equally persistent in their attacks. The glass both outside and inside must be clean. The frequent fogs in the neighbourhood of London leave a coating of blacks, not only on the external glass and woodwork, but it penetrates to the inside and chokes the breathing pores of the leaves. Distance from the glass.—We get the leaves as closely to it as possible without their coming into actual contact. The trellis to which the plants are trained is made so that it can be lowered or raised to or from the glass as the changing seasons seem to require. The distance in winter is 9 inches, and in summer 14½ inches. We sowed seeds about ten days ago; it is about the worst time in the year to put them in, but they vegetated freely in a brisk bottom heat. As soon as the seed leaves formed the plants were potted-off separately into small pots, and again plunged in the bottom heat until fresh roots were formed, when the pots were taken out of the plunging material and placed on a shelf quite close to the glass. They are now for the time of the year making healthy vigorous development.

PLANT STOVE.

We can only reiterate our remarks about cleanliness, our time having been employed cleansing staging, wood, and glasswork, as well as removing white scale from Cattleyas, Lælias, and other Orchids. There is but few plants in flower at present, and it is to the Orchid family that we must look for the best display at this dull season. *Lælia anceps Barkerii* will soon open its large handsome flowers. *L. autumnalis* is now in flower, and will never disappoint if grown like its Mexican compeer, *Lælia majalis*, in the sunniest position of the cool house. The beautiful *Calanthes*, which anyone having a slight knowledge of plant-culture can grow, ought not to be omitted in any collection of stove plants. Whether the spikes are used for decorative purposes indoors, or for the embellishment of the plant stove, they continue in beauty for many weeks, and their culture is so simple. After draining the pots well, and placing some of the most fibry portion of medium turfy loam over the drainage to prevent the compost from mixing with it, pot the bulbs (three large ones in a 6-inch pot) just before they start into growth in February, using the fibry portion of good loam in a rough state, and they succeed in this without any admixture, except enough sand to keep it open; but the strength of the spikes are increased if a little rough rotted frame dung and leaf mould is added, about a sixth part of each. The pots from which all the flower spikes have been cut will not receive any more water until February. We have also an excellent display of *Ixoras*. *I. javanica* is exceedingly handsome, and it continues in flower for six or eight weeks. They will flower freely now if the flower heads are pinched off before the flowers open during the summer months. *I. Colei* is also in flower, and is pretty; but unless the plant is grown well this variety is not striking. Watering is very carefully attended to, and the atmospherical conditions of the house are also of importance. A moist condition of the atmosphere is imperative, but no vapour from hot pipes. The conditions are right if delicate flowers last long in beauty.—J. DOUGLAS.

TO CORRESPONDENTS.

*. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

Books (A Young Reader).—The "Hentig Manual" can be had by post if you enclose seven postage stamps with your address. (Orchids).—Appleby's Orchid Manual. You can have it post free from our office if you enclose 2s. 6d. with your address.

STAG'S-HORN FERN CULTURE (J. F. S.).—This Fern (*Platycerium alcicorne*) succeeds quite well in a pot, on a block of wood, in the crevices upon the face of rockwork, and in a basket. The latter is a nice way of growing it, and it, if anything, grows better in a suspended basket than in a pot. It ought to

be established in the basket, and then its position reversed, turning upside down, the plants and compost being secured by copper wire. We have seen a plant in a pot suspended, the plant secured from falling out of it by copper wire when it was suspended upside down. The barren fronds soon cover the pot, and water is easily given from above. It succeeds admirably in a compost of turfy brown peat three parts, and half a part silver sand and crocks, used rather rough and well mixed. Good drainage must be given. There are no doubt several plants and Ferns well worth introducing from Madeira, but they would not be new, as the island has long been ransacked of its botanical treasures by Europeans.

WINDOW PLANTS NOT THRIVING (J. W.).—The placing of the sharp sand upon the surface of the pots would not cause the injury you complain of, nor would it keep out frost. It would not do any good in any quantity, but contrariwise, and ought to be removed at once. The kind you name is not good for plants; silver sand is the most suitable. Probably your plants are suffering from cold. You ought at night to remove them from the window if the window be too cold, it being necessary they be kept from frost and be watered very sparingly, giving only sufficient to keep them fresh. The bulbs in the spare room in pots ought to have water to keep them moist, and should have air whenever the weather is mild, and when they appear above ground should be placed near the window, or they will draw towards the light and become weak. In very severe frost the window should have some thick protective material placed over it, so as to save them from frost. It is a mistake to bring them forward in this way if you intend to plant them outdoors. They would have been infinitely better planted in the bed in October or early November where they are to flower, as, should the weather prove severe in spring, their growth, from being made in the room, will be liable to be cut by frost. Small coal mixed with the soil is a mistake; sand or crocks broken very small is the proper thing. Do not give them liquid manure, and plant them out so soon after this as you can, at least by the time when they have grown an inch. In the room their growth will only become poor and drawn.

PLANTING LILY OF THE VALLEY (S. P. P.).—November is probably the best time to make new beds of these, but any time in mild weather up to March inclusive will answer. Have the ground well and deeply dug, enriching it with leaf soil or well-rotted manure, and plant them in rows a foot apart, and in small clumps of three to half a dozen crowns the same distance between, and an inch deep—that is, the top of the crowns, and water abundantly in dry weather, keeping clear of weeds. In autumn loosen the soil lightly, not disturbing the roots between the rows, and give a top-dressing about an inch thick of decayed leaves or other rich vegetable compost. If this be not at hand, half the thickness of well-rotted manure will answer. In spring you ought to have flowers.

PEACHES, NECTARINES, AND APRICOTS AGAINST A BOARD FENCE (Hem.).—The trees growing well and showing abundance of blossom, but not fruiting, indicate the climate is not unfavourable; but the blossom and probably young fruit are destroyed by frost. From the trees showing blight, which we presume is mildew, we apprehend the climate is not so favourable as it appears, or the soil. Two feet is an outrageous depth to plant fruit or any kind of trees. They ought to be planted so that the setting-out of the roots—i.e., the uppermost, are on a level with the surrounding ground, and these should not be covered deeper than 3 inches with soil. If yours are deeper, and as the ends of the shoots die back the wood is not well ripened, lift them carefully, taking care to preserve the fibres and as much soil as possible adhering to them, and plant as before named with the roots level with the surrounding ground, and cover them 3 inches deep, giving to the surface a mulching of short littery manure. Add to the soil a fourth of well-rotted manure, and make the soil very firm under, around, and over the roots, so as to induce stiff short-jointed wood. Syringe the trees freely in summer after May in the evening of hot days, and water in spring if the weather be dry. Augment the covering; canvas is better than a net protection.

SOWING FOR SUMMER BEDDING (Young Beginner).—You will be doing well to depend chiefly upon hardy annuals, of which we name a few which, continuing long in bloom, are desirable:—*Alyssum maritimum*, *Bartonia aurea*, *Calliopis marmorata nana*, *Convolvulus minor*, *Erysimum Peroffskianum*, *Leptosiphon densiflorus*, *Linum grandiflorum coccineum*, *Nasturtium Tom Thunb* var. *scarlet*, *King of Tom Thunb*, *scarlet*, yellow, and crimson; *Nolana stipulifolia*, *Saponaria calabrica* and *S. calabrica alba*, *Sauvathia procumbens flore-pleno*, and *Silene pendula ruberrima*. The *Silenes* are very pretty, but scarcely continue long enough in bloom for summer bedding. These should be sown early in April where they are to flower. In your frame, which we presume you can make a slight hotbed for, you may sow early in March in pots or pans, or, if you have no heat, at the end of March or beginning of April; if heat, sow in March. *Ageratum Imperial Dwarf*, *Lobelia speciosa*, *Petunia hybrida*, *Phlox Drummondii* vars., *Senecio elegans*, double vars., crimson, red, and white; *Tagetes sigata pumila*, *Verbena hybrida*, *scarlet*. These as well as Ten-week Stock, German Asters, Dwarf French Marigold, and *Helichrysum*, which may be sown when the others are up, or early in April. When large enough to handle they should be pricked-off about an inch apart and grown-on in the frame, hardening well off before planting out. The height and colour you may see in any catalogue. Golden Feather *Pyrethrum* treated in the same way will make nice plants by May, and so will *Stellaria graminea aurea* if you can procure seed.

Roses (West Coast of Ireland).—We should not have more than fifty standard plants, and these we should dispose alongside of the walks, or positions where they may be readily examined. Dwarfs on the Manetti we should have for the bed, and smaller beds to suit your taste. We could not, however, advise you as to arrangement, but an oblong bed would answer, as also any form not very broad. The following are the best in their classes:—*Hybrid Perpetual*—Alfred Colomb, *Senateur Vaisse*, *Comtesse d'Oxford*, *General Jacqueminot*, *Charles Lefebvre*, *Fisher Holmes*, *Charles Verdier*, *John Hopper*, *Baroness Rothschild*, *La France*, *Mdlle. Eugénie Verdier*, *Caroline de Samsal*. *Perpetual Moss*—*Mrs. W. Paul*, *Salé*. *Bourbon*—*Baronne Gonella*, *Sir Joseph Paxton*. *Noisettes* require a wall. *China*—*Clara Sylvia*, *Cramoisi Supérieure*, *Louis Philippe*, *Mrs. Bosanquet*. *Tea-scented*—*Gloire de Dijon*. We should have principally Hybrid Perpetuals. Raise rather than lower the beds. The soil would suit *Rhododendrons* and *Azaleas*. Manure and trench deeply for the Roses. Rivers's "Rose Amateur's Guide," to be had through bookseller.

D'ARCY PIPPIN (J. B.).—We recognised the specimens you sent. The Apple is usually called the Baddow Pippin. A gentleman to whom the specimens were shown writes, "I remember being shown the Apple many years ago at Tolsham, D'Arcy, in Essex, by a tall perpendicular surgeon residing there." Grafts may have been taken to Baddow, and from there have come into the possession of the Harrises, nurserymen at Broomfield, "all three of whom, John, William, and Luke, I remember at school in Chelmsford," adds the

gentleman aforesaid. The Apple will be described in the new edition of Dr. Hogg's "Fruit Manual."

ROSE (J. R. Boyd).—The bloom looks like Anna Alexieff, but it is not easy to name, as it came flattened in a letter.

FORCING STRAWBERRIES (M. J.).—The best Strawberry for very early forcing is Black Prince, followed by Keens' Seedling. Of the three varieties you named, President is the best. You should place your pots in the house at once and keep up a temperature of 45° at night, raising it to 50° in two or three weeks, but not higher than this until the flower buds are discernible, when the night temperature may rise to 55°, and ultimately to 60° by the time the flowers open. When in flower the atmosphere must be drier, and as much air admitted as possible. The plants will succeed best on a shelf near the front of the house. The Vines may be taken in when the buds show signs of starting; or if the Grapes are required early the Vines may be started with the Strawberries. If President is started at once the fruit would be ripe early in April.

INGRAFTING PEAR AND GRAFTING PLUM TREES (W. W.).—As the Char-montel Pear tree is very large, we advise you to try three different varieties on it—viz., Williams' Bon Chrétien, Beurre d'Amanlis, and Louise Bonne of Jersey. The best Plums to work on the Plum stocks, if for standards, are Victoria, Prince Englebert, Mitchelson's, Orleans, and as a very early variety, Rivers' Early Favourite. The best for walls are Jefferson's, Coe's Golden Drop, Green Gage, and a good black Plum is Angelina Burdett.

EXPOSING GREENHOUSE VINES (A Subscriber, Birmingham).—It is quite unnecessary to expose greenhouse Vines by passing their stems to the outside during winter. It often injures them, and is never beneficial.

HEADING DOWN A PEAR TREE FOR GRAFTING (A Novice).—Do not head the tree back until the time of putting in the grafts, and this is usually to be done in March, dependant upon the season. The grafts ought to be removed before they are started into growth, and kept with their ends in moist soil or clay. The grafting should be done when the tree buds are swelling; the sap is then up. Crown-grafting will be the most suitable if the branches are over 2 inches in diameter, or cleft-grafting; but if the branches are small tongue or whip-grafting is best.

PEACH HOUSE INFESTED WITH INSECTS (H. G.).—The brown bugs may be brown Peach aphid, which may be removed by dressing the trees now with a solution of soft soap in a gallon of tobacco juice, to be had of any druggist, the soap being thoroughly mixed with the tobacco juice and applied to the trees with a brush, taking care to reach every part and not dislocate the buds, and applying at a temperature of 100° to 120° before the buds swell. It may, however, be brown scale, which may be destroyed by adding to the above-named solution a wineglassful of spirits of turpentine to every half gallon, thoroughly mixing, and applying with a brush. If it be scale, and the trees are badly infested, repeat the application in a week, taking care to thoroughly apply it to every part. This has effectually cleared an Early York and Royal George of brown scale and the aphid upon others, the trees sustaining no injury. Sweet oil would no doubt destroy the scale, and at the same time cause injury to any not-overripe wood. It is a pigment better avoided than adopted in fruit culture. The turpentine must be thoroughly mixed with the solution, and only applied when the trees are at rest.

TRELLIS FOR PEAR OR QUINCE (J. E.).—The space you propose for the upright training is not too little between the branches. The distance between the branches ought not, however, to be less than 8 inches, better 10 inches, as, though the distance may at first appear great, it is none too much when the trees are plentifully supplied with spurs. Usually they answer well at 8 inches. The trees you propose planting are maidens or have been grown one year from maidens, and have two shoots. Cut each shoot as you show in your sketch to originate the shoots A, C, and continue the spring growth in the direction A, B. The heading to A will give you two shoots; one is to be trained upright, forming the branches A, C, and the other taken forward, and when it reaches B be taken upright by a gentle curve, forming the branches B, D. When the shoots A, C, have grown 9 inches take out their points; but the shoots B, D, are not to be stopped until they have 9 inches of perpendicular growth, and then pinch them. Of the shoots which originate from the stopping take up one as leader, and the others pinch at the third leaf. If the leading shoot after stopping does not grow more than 9 inches do not stop it nor shorten at the winter pruning, but at every 9 inches stop the shoots—that is, the leaders, and the side at three leaves. Dispense with winter pruning, or have little necessity for it.

PICKING VINES (Faulk).—Prune them as you propose to two eyes, the Vines being worked upon the spur system, and when they break select the lower shoot if it show fruit, and remove the upper one. By this plan you will keep the spurs short, but by leaving the shoot from the upper eye year after year the spurs soon become long. Of course, when there is not fruit on the lowest shoot it must be removed and the upper fruitful one retained.

LABOUR REQUIRED (A. W. H.).—The extent of gardens you mention will be well kept by nine hands and the head gardener, whose wages ought not to be less than 30s. per week, house, &c.; but so long as the supply exceeds the demand gardeners' wages will, as compared with other trades, be at a discount. Of course there is exception to the general rules: some employers are not ruled by market values.

GARDEN LABELS.—In our notice of "Yeates' Garden Labels," at page 519, his name was erroneously spelt "Yeast."

NAMES OF PLANTS (W. D. C.).—The shrub is *Lonicera involucrata*, Involucrated Honeysuckle. The other specimens were mere miserable leaves. (A Constant Reader).—We cannot name plants from leaves only, we must have flowers besides. (W. H.).—We are obliged to return you the same answer.

POULTRY, BEE, AND PIGEON CHRONICLE.

LEEDS SMITHFIELD POULTRY EXHIBITION.

Held December 8th, 9th, and 10th. The quality on the whole was good, but there was an evident falling-off in the number of entries, consequent, we think, on the reduction of classes for poultry. In former years prizes for both adults and chickens were provided, and the plan appeared to be successful; but this year all ages competed together, and as a natural result in those breeds in which size is a point, exhibitors many of them did not compete, as chickens in such classes as Brahmas,

Cochins, Dorkings, and Game, cannot compete as a rule successfully with old birds. In some breeds, such as Bantams, &c., all ages do well together. We think it worth while reflecting on the matter, and if not too late, as it never is to mend, that the Committee return again to their good old ways.

Game were very good classes. In single cocks two fine old Brown Reds secured first and second with little to choose between; third a very stylish old Black Red. Black-breasted Red cocks a good class. First very good; the pullet one of the best we have yet seen. Second and third also good; but we should have placed 154, highly commended, before either, the cock being perhaps the best in the class in our opinion. Brown.—First-and-cup a splendid pen throughout, and well worthy their position; second a fine hard-feathered pen, as was also the third. Duckwings.—First a stylish pen of chickens—the Birmingham winners we think, and hence a clear win, and apparently honestly shown, exemplifying the old saying, that "honesty is the best policy." Second old birds, too heavy in feather. Third we liked better. Any other variety.—Grand old Willow-legged Piles were first; second and third good Pile chickens of capital quality. *Dorkings*, all ages together, a moderate class. *Cochins* (Buffs).—First capital chickens; second good adults. *Cochins* (Any other colour).—First fine-shaped old Partridge. Second and third capital Whites; old birds well shown. *Brahmas* (Dark).—First, cup, and Mayorese's cup, and second Mr. Ansell's two old pens secured, but we should have transposed them. Lights only a moderate class. *Spanish*.—Amongst them a few good pairs. First the Birmingham winner, old bird; second a capital chicken. *French* were fine classes, Mr. Grant and Mr. Cutlack's Houdana being very good; and Mr. Cutlack and Mr. Crabtree's Crêves were also fine. *Polands*.—Mr. Beldon's first-and-cup birds, old Gold; second Silvers, with his well-known birds; third old Golden cock, good in colour. *Hamburgs* were good classes, the first Black, Golden-pencilled, Silver-pencilled, and Silver-spangled, not forgetting the old Gold-spangled, to which the cup was awarded, all being first-rate. *Bantams* were all good classes. The Black-Red cock of Mr. Hall, to which first was awarded; and the cup pen, Black Reds, Mr. Entwistle's little gems. The Duckwings and Brown Reds were also good. Black Bantama were a large class, and the quality capital, the first being very good in comb and earlobes; second also very good, with better-furnished tail, but scarcely so good in comb and earlobe. In Whites the first was perhaps the best we have seen this season. Sebrights good. Gold were first; second and third Silvers, white ground, but rather faint in lacing. The Booted class was a failure, only two pens (Whites) putting in an appearance. Any other Bantam.—First and second good Pile Game. *Turkeys*, *Geese*, and *Ducks* were all fairly represented, Mr. Walker here coming well to the front.

Pigeons were a nice collection. The *Pouters*.—First White; second Blue. *Carriers*.—First-and-cup grand Duns; second Black. *Tumblers* were small classes. Mr. Silvester's Almonds, first, were capital in colour and well broken. Mr. Horner's were also good. Long-faced, Black Mottle, and Black Beards were both good. *Foreign Owls*.—First very small Whites, well shown; second Blues. *English Owls*.—First Silvers, remarkably good; second Blues. *Jacobins*.—First and second Reds; both good, with little to choose between them. *Trumpeters*.—First a capital pair of the new type. *Turbits*.—First Yellow, second Blues; should have placed second first. *Pantails*.—The Newark birds first and second, clearly winning. *Barbs*.—Prize birds neat young Blacks. Mr. Harvey's well-known birds lost their chance, their being made-up in eyes. *Nuns* a fair class, the winners Black. *Dragoons*.—First a splendid pair of Yellows; second magnificent Blues. *Antwerps*.—Fair classes; but some of the best were too late, notably Mr. Wright. *Muggies*.—First Red, pretty; second Black, nice. *Runts* only one pen, large Silver. *Swallows*.—Both prizes to Reds. *Archangels*.—First capital in metallic lustre. Any other. —First, Spangled Ice; second, White-breasted Ice; a pretty pair of Isabels highly commended.

A Silver Cup, value Five Guineas, given by the Mayorese (Mrs. Mars-Jeul), for the best Pen of Pouter in the Exhibition—awarded to Mr. Thomas F. Ansell, of St. Helen's (Brahma Pouter).

Five Pounds, or Silver Plate of the same value, for the best Pen of Game Fowls was awarded to Tom Mason, Carus Lodge, Lancaster (Brown-breasted).

GAME.—Cock—1, D. Clayton, Manningham. 2, T. Mason. 3, E. Akroyd, Ecclehill, Leeds. *he*, W. Spencer, J. Fulton. *he*, F. Sales. *Black-breasted*—1, W. J. Pope, Biggleswade, Bedfordshire. 2, J. Nelson, Cockshaw, Hexham. 3, W. Spencer, Haworth. *he*, T. Hurst. *he*, E. Akroyd. *Brown-breasted*—1, T. Mason. 2, E. Payne, Embsay. 3, F. Sales, Crowle, Doncaster. *he*, J. W. Thornton. *Mrs. Walslaw*. 4, R. Smith, W. Bentley. *Duckwing*.—1, E. W. Wood, Worcester. 2, W. Spencer, Haworth. 3, F. Sales. *he*, T. Mason. J. Nelson. *Any other variety*.—1, F. Sales. 2 and 3, G. S. Thompson, Moorlands.

Four Pounds, or Silver Plate of the same value, for the best Pen of Fowls in the Pouter, Cochins, Chinas, and Brahmas Pouter classes—awarded to T. F. Ansell, St. Helen's (Dark Brahmas).

COCHINS.—1, R. Smith, J. Nelson, Maltan. 2, G. Poynder, Kirby Moor-side. 3, W. Harvey, Shethill. *he*, W. Moritt; F. Shaw; J. F. Mandle.

COCHINS—CHINA. *Chinaman* or *Buff*.—1, W. H. Crabtree, Levenshulme, Manchester. 2, J. White, Whitley, Netherton, Wakefield. 3, J. North, Huddersfield. *he*, R. C. Mughly. *Any other variety*.—1, T. Asplen, Chireb, Accrington. 2, H. Beldon, Gortstock, Bingley. 3, C. Carr, Wilsden, Bingley. *he*, J. White.

BRAHMA POUTER.—Dark.—1 and 2, T. F. Ansell. 3, J. Lyon, St. Helen's.

he, T. Crosby; R. C. Mitchell; W. Schofield. *Light*.—J. T. Hineka Humberstone, 5, T. Howitt, Masbrough, Rotherham. 3, H. Beldon.

Four Pounds, or Silver Plate of the same value, for the best of Fowls in the Spanish, Hondans, Cuckoo, and Poland Classes, was awarded to H. Beldon, for Spangled Poland.

SPANISH.—1, H. Wilkinson, Earby, near Skipton. 2, H. Beldon. 3, Pallister and Hawkins, Tockholes. *he*, G. Thirsk; G. Powell.

HONDANS.—1, H. Grant, Bradford. 2, W. Cuckack, jun., Littleport, near Ely.

3, T. Goodwill, Pickering. *he*, M. Hall; G. W. H. H. H. H.

CUCKOO.—1, W. Cuckack, jun., 2, W. H. Crabtree, 3, Miss G. A. Patchett, Southwell. *he*, Rev. E. Whank; Miss Patchett.

POLANDS.—*Gold or Silver-spangled*.—1 and 2, H. Beldon. 3, C. Walker, Boroughbridge. *he*, T. Dean.

Four Pounds, or Silver Plate of the same value, for the best Pen of Ham-burgh Fowls, was awarded to T. Dean, Keighley, for Golden-spangled Ham-burghs.

HAMBURGH.—*Black*.—1 and 3, H. Robinson, Baildon, Shipley. 2, H. Beldon, *he*, W. Sale; Popplewell Bros.

HAMBURGH.—*Golden-spangled*.—1 and 2, H. Beldon. 3, G. and J. Duckworth, Church, Lancashire. *he*, W. Driver; J. Smith; S. Gill. *Silver-spangled*.—1 and 2, H. Beldon. 3, Ashton & Booth, Mottram. *he*, E. Gill.

HAMBURGH.—*Any other variety*.—1, J. F. Watton, Rawtenstall, Manchester. 2, T. Cropper, Bacup. 3, H. Beldon.

SELLING CLASS.—1, W. White, Whitley, Netherton, near Wakefield. 2, H. Beldon. 3, E. Shaw, Oswestry.

Four Pounds, or Silver Plate of the same value, for the best Pen of Bantams, was awarded to W. F. Entwistle, Bradford, for Black-breasted Game.

GAME BANTAMS.—*Cock*.—1, G. Hall, Kendal. 2, J. Blamires, Great Horton, Bradford. 3, W. Baskerville, Manchester. *Black-breasted*.—1, W. F. Entwistle. 2, Mrs. Walslow, Batley. 3, G. Noble, Dewsbury. *Brown-breasted*.—1 and 2, F. Steel, Halifax. 3, W. F. Entwistle. *Cuckoo*.—1, W. F. Entwistle. 2, J. Mayo, Gloucester. 3, W. Cator, Kirby Lonsdale.

BANTAMS.—*Black*.—1, J. Earslow, Rotherham. 2, Milner & Beauland, Keighley. 3, W. H. Shackleton, Bradford. *White*.—1, H. Beldon. 2, T. Cropper, Bacup. 3, Rev. F. Tearle, Gazeley Vicarage. *Silvery* (Gold or Silver).—1, W. Richardson, York. 2 and 3, J. W. Lloyd, Kingston, Herefordshire. *Booted*.—2, H. Beldon. 3, W. Newberr, Newcastle. *Any other variety*.—1, G. Noble, Dewsbury. 2, S. Smith, Halifax. 3, F. Steel.

TURKEYS.—1, J. Walker, Rochdale. 2, F. G. S. Rawson, Thorpe, Halifax. 3, J. B. F. G. S. Rawson.

GESE.—1, J. White, Whitley, Netherton, Wakefield. 2, J. Walker, Rochdale. 3, F. G. S. Rawson.

DUCKS.—*Aylesbury*.—1, J. Walker. 2, J. Hedges, Aylesbury. 3, C. Holt, Rochdale. *Rouen*.—1 and 3, J. Newton, Suden, Leeds. 2, Walker. *Any other variety*.—1 and 3, W. Binos, Pudsey. 2, A. and W. H. Silvester, Market Hall, Sheffield.

SELLING CLASS.—1 and 3, C. Holt, Rochdale. 2, G. Pounder, Kirby Moorside.

PIGEONS.

Four Pounds, or Silver Plate of the same value, for the best Pen of Pigeons, was awarded to W. Ridley, Hexham, for Carriers.

POUTERS.—1, W. Ridley. 2, E. Horner, Harewood.

CARRIERS.—1, W. Ridley. 2, E. Horner.

TUMBLERS.—*Almonds*.—1, A. and W. H. Silvester. 2, E. Horner. *Any other variety*.—*Short-faced*.—1, E. Horner. 2, A. and W. H. Silvester. *Long-faced*.—1 and 2, J. Dyke, Hexham.

OWLS.—*English*.—1, W. Binos. 2, F. Steel. *Foreign*.—1, Miss F. Sennor, Leeds. 2, E. Horner.

JACOBS.—1, R. W. Richardson, Neaux Abbey, Beverley. 2, J. Thompson, Fecol, Bideley.

TROTTERS.—1, W. Harvey, Sheffield. 2, E. Horner.

TURBOTS.—1, E. Horner. 2, R. W. Richardson.

FANTAILS.—1 and 2, J. F. Liversidge, Newark, Notts.

BARBS.—1 and 2, J. Thresh, Bradford.

NUNS.—1, J. Cargill, York. 2, E. Horner.

DRAGONS.—1 and 2, R. Woods, Clipsestone Park.

ANTWRAPS.—*Short-faced*.—1, J. Mitchell, Keighley. 2, E. Horner, *Long-faced*.—1, J. Croxall, Wakefield. 2, W. Elms, Idle.

MAGPIES.—1, Miss F. Sennor. 2, J. T. Hineks.

RUNTS.—1, W. Harvey, Sheffield.

SWALLOW.—1, E. Horner. 2, W. Harvey.

ARCHANGELS.—1, Miss F. Sennor. 2, J. Aconley, Rosedale Abbey, Pickering.

ANY OTHER VARIETY.—1, Miss F. Sennor. 2, A. and W. H. Silvester.

SELLING CLASS.—1, J. Cargill, York. 2, A. W. Vren, Lowestoft.

RABBITS.

LOP-EARED.—Ears not tampered with, but in their natural state.—1, J. Wharton, Bramham. 2, F. S. Banks, Doughty Street, London.

SILVER-GRAY.—1, J. Hallas, Huddersfield. 2, S. Ball, Bradford.

HEMALAYAN.—1, S. Ball. 2, C. E. Mason, Rochdale.

ANGORA.—1, H. Smedley, Falford, York. 2, W. Whitworth, jun.

BELGIAN HARE.—1, J. Hallas. 2, W. Whitworth, jun.

DUTCH.—1, A. Lund, Monk Bar, York. 2, H. E. Gilbert, Rugby.

ANY OTHER VARIETY.—1, M. Marsland, Goole. 2, S. Ball.

SELLING CLASS.—1, J. Wharton. 2, G. C. Hutton, Bradford.

DORKING POULTRY SHOW.

This was held at the Public Hall, Dorking, December 10th.

This Show used to be the Dorking fauciers' Derby, and a prize here was formerly considered as great an honour as a cup elsewhere.

For the last two or three years, however, the Show has gone down a good deal in public favour owing to the Committee requiring that a cock and two hens should be sent in each pen,

but the judicious alteration of this rule bids fair to bring this good old Show again into notice. Only the first four classes are open to general competition, but among the birds exhibited

in these classes were to be found most of the celebrated winners of the day, and the competition this year was very keen. Mr. Leno again officiated as Judge, and it is evident from the favourable way in which his awards were received, that his knowledge of poultry extends beyond his favourite Sebright Bantams. The awards given below will speak for themselves.

DORKING.—*Coloured*.—Cap. F. Parlett, Chelmsford. 2, Rev. E. Bartrum, Berkhamstead. 3, Lord Turnour, Petworth. *he*, F. May, Reigate; J. Taylor, Dorking. *he*, H. Humphrey, Ashington; H. B. Young, Dorking. *Chickens*.—Cap. Rev. E. Bartrum. 2, T. C. Barnell, Micheldever. 3, J. Taylor, *he*, J. Clift, Dorking; G. Ellis, Betchworth; H. Humphrey; J. Taylor. *he*, Lord Turnour.

DORKING.—*Coloured*.—*Cockerel*.—1, J. Taylor. 2, J. Clift. *he*, G. Ellis. *Pullets*.—1, Marquis of Blandford, Holmwood. 2, Rev. E. Bartrum. *he*, G. Ellis. *he*, J. O. Hodges. *he*, M. Putney.

DORKING.—*Coloured*.—*Selling Class*.—1, Lord Turnour. 2, G. Ellis.

DORKING.—*Coloured*.—1, J. Hammond, Reigate. 2, G. Ellis. 3, F. May.

he, E. May, Dorking. *he*, F. May, Dorking. *Chickens*.—1, G. Ellis. 2, J. Clift. 3, J. Hammond. *he*, J. Morley, Newdigate. *he*, H. Mills, Dorking. *he*, E. May; J. H. Putney, Dorking.

DORKING.—*Coloured*.—*Cock*.—1, J. Tweed, Dorking. 2, J. Bargman, Dorking. 3, Ivery & Son, Dorking. *Cockerel*.—1, E. May. 2, H. H. Young. *he*, E. T. Bennett, Reigate. *he*, H. Mills.

DORKING.—*Coloured*.—*Hens*.—1, J. H. Putney. 2, H. Mills. *he*, G. Ellis. 3, Ivery & Son; J. H. Putney. *he*, T. Hood, Reigate. *Pullets*.—1 and 2, G. Ellis.

DORKING.—*White*.—1, G. Cubitt, Debby, Dorking. 2, J. C. Wilson, Hendley. *Chickens*.—1, G. Cubitt. 2, W. Chandler, Buckland, Beigate. 3, T. Knight.

he, G. Allen, Buckland, Reigate; T. Hoar. *he*, G. W. F. Watson.

DORKING.—*White*.—*Cock*.—Prize, G. Cubitt. *Hens or Pullets*.—Prize, W. Chandler. *he*, G. Cubitt; W. F. Watson, Henfold, Dorking.

DORKING.—*Blue Spangled*.—1, W. Griffin, Milton, Dorking. 2, Virgo & Son, Guildford. 3, H. H. Young. *Chickens*.—1, J. Wood, Westcott. 2, J. H. Putney. 3, R. Gamon, Westcott, Dorking.

DORKING.—*Blue Spangled*.—*Cock*.—Prize, J. H. Putney. *he*, Mrs. Mayo, Dorking. *he*, Mrs. Mayo; Virgo & Son; J. Wood. *Hens or Pullets*.—Prize, H. H. Young. *he*, Mrs. Mayo; J. H. Putney; R. Pittard, Dorking. *he*, Virgo & Son.

BRAMA.—Prize, J. Mew, Redhill. *he*, J. R. Corbett, Betchworth; Rev. J. P. Wright, Reigate. *he*, Miss E. Barclay, Rokehold, Dorking.

SPANISH.—Prize, F. May. *he*, P. Roffey, Reigate.

GAME.—Prize, Rev. J. Merriman, Cranleigh. *he*, J. Akehurst (2).

BANTAM.—Prize, G. Vigors, Besham. *he*, T. Randall, jun., Guildford (2); G. Vigors.

HAMBURGH.—*Golden or Silver*.—1, 2, and 3, Mrs. Trowbridge, Dorking.

DUCKS.—*White Aylesbury*.—1 and 2, J. B. Nichols, Holmwood Park. *Any other variety*.—1, J. R. Corbett. 2, J. D. Taylor, Reigate. *he*, J. R. Corbett; C. W. Haydon, Leatherhead; J. Wood; H. H. Young.

GESE.—1, J. C. Wilson. 2, W. F. Watson. 3, Rev. J. Merriman.

TURKEYS.—1, J. C. Wilson. 2, W. Phillips, Dorking.

CARMARTHENSHIRE AGRICULTURAL SOCIETY'S POULTRY SHOW.

This was held at Carmarthen on December 8th.

DORKINGS.—1, J. Buckley, Peofyfal. 2, J. McConnell, Ewys Harold, Hereford.

SPANISH.—1, E. Widwood, Worcester. 2, H. Feast. 3, R. Tracy, Pembroke.

BRAMA.—1, J. W. Watney, Dursley. 2, J. E. Williams, Chester.

he, F. H. Watkins, Hereford; F. L. Green, Oaklands, Carmarthen. *Light*.—1, J. Bloodworth, Cheltenham. 2, H. Feast. 3, E. Lawrence, Bridgend. *he*, J. Buckley; Mrs. Thomas, Moreb, Llandilo; W. H. Taylor (2); Mrs. H. Studdy, Ashdale, Haverfordwest (2); W. Harris, Bridgend.

COCHIN-CHINAS.—*Buff*.—1, J. Bloodworth. 2, E. Winwood. 3, H. Feast. *he*, — McConnell. *Any other colour*.—1, R. Jones, Neath. 2, H. Feast. 3, G. Morgan.

GAME.—*Black-breasted Red*.—1, E. S. Gossell, Stroud. 2, G. S. Cole, Llanelli. 3, J. P. James, Llwynmawr, Swansea. *he*, J. Buckley; O. John, Hafod, Swansea. W. L. Blake, Llandaff. *Any other variety*.—1, E. Pearson, Swansea. 2, D. Morgan. 3, H. Feast. *he*, W. Tillotson, Coates, Leeds; W. H. Taylor; J. F. Phillips, Swansea; S. Burford, Hafod, Swansea.

HAMBURGH.—*Golden-pencilled*.—1, J. F. Davies, Neath. 2, Mrs. Lewis, Llanelli. 3, H. Feast. *he*, J. Carr, Hafod, Swansea; W. H. Taylor. *Silver-pencilled*.—1 and 2, T. R. Mitchell. 3, H. Feast. *he*, J. Carr; G. Morgan; A. F. Fankler, Thrapston.

HAMBURGH.—*Golden-spangled*.—1, J. Carr. 2, T. R. Mitchell. 3, P. H. Stone, Gloucester. *he*, — Langdon, Johnstone. *Silver-spangled*.—1, T. R. Mitchell. 2, H. Feast. 3, J. Carr.

POLISH.—1, J. Bloodworth. 2, H. Feast. 3, — McConnell. *he*, J. J. Scott, Llanstephan.

ANY OTHER BREED OR CROSS.—1, J. G. H. Morris, Angeltown, Bridgend. 2, H. Feast. 3, P. Hanson. *he*, J. A. Timmins (2); W. Harris, Bridgend; T. W. Davies; F. L. Green (2).

BANTAMS.—1, G. Lewis, Swansea. 2, J. Bloodworth. 3, H. Feast. *he*, J. H. Watkins (2); E. C. Phillips, Brecon.

SELLING CLASS.—*Any breed*.—1, F. L. Green. *he*, W. H. Taylor. *he*, J. P. James; J. F. Davies.

SELLING CLASSES.—*Brahma or Coch*.—*Cockerel*.—1, A. T. Waters. *he*, F. L. Green (3). *Pullet*.—1, F. L. Green. *he*, F. L. Green; W. Green.

DUCKS.—*Aylesbury*.—1, J. Buckley. 2, E. M. Davies, Upland. 3, J. McConnell. *he*, Viscount Enllyn; J. F. Davies; Mrs. H. Studdy. *Any other variety*.—1, T. H. Taylor, Bridgend. 2, — Law, Froud. 3, T. D. Phillips. *he*, — Law; W. H. Taylor (2); Miss Jones, Glanrhyd; — Harries, Abercannau; W. Woodford, Cunnick, Brecon.

TURKEYS.—1, J. W. Morrison, Pembroke. 2, Viscount Enllyn. 3, J. P. James. *he*, J. Buckley; Mrs. H. Studdy; A. Jermin, Pembroke.

GESE.—*White*.—1, T. Rees, Pibwllwyd. 2, J. Fisher, Morfa, Pembrey. 3, T. Francis, Penygraig. *he*, J. Buckley. *Grey*.—1, Mrs. H. Studdy. 2 and 3, A. Jermin. *he*, 1, Anthony; J. Buckley; — Davies (2).

DORKINGS.—*To be competed for by Mechanics or Labourers*.—1, D. Lewis, Johnstown. 2, I. Jones. 3, J. Harries.

ANY OTHER BREED.—*To be competed for by Mechanics or Labourers*.—1, J. Harris (Light Brahma). 2, J. Thomas, B. Salt. 3, W. H. Taylor (Light Brahma). *he*, M. Davies (Dark Brahma); D. Morgan (Game); Mrs. E. Morgan (Cochin-China); J. Williams; T. Morgan.

DUCKS.—*To be competed for by Mechanics or Labourers*.—1, J. Jones, Daulan-fach. 2 and *he*, W. H. Taylor (Rouen and East Indian). 3, H. Lewis, Porth (Aylesbury).

PIGEONS.

CARRIERS OR DRAGONS.—1, S. D. Baddeley, Hereford (Carriers). 2, J. R. Watkins, Hereford (Carriers). *he*, S. D. Baddeley (Carriers); J. W. Morrison (Carriers); E. T. Houle, Carmarthen (Carriers).

POUTERS.—1, J. H. Watkins. 2, J. Sperry.

TUMBLERS.—1, W. G. Davies, Swansea. 2, J. E. Williams. *he*, T. F. Phelps, Ross.

FANTAILS.—1 and 2, E. T. Houle. *he*, J. H. Watkins.

BARB AND ANTS.—1, T. F. Phelps. 2, J. Sperry. *he*, E. T. Houle.

JACOBS.—1, T. F. Phelps. 2, E. T. Houle. *he*, J. H. Watkins; W. G. Davies.

ANY OTHER VARIETY.—1, E. T. Houle (Owls). 2, T. F. Phelps (Archangels). 3, W. G. Davies (Trompeters). *he*, J. W. Morrison (Owls); J. H. Watkins; W. G. Davies (Magpies).

RABBITS.—1, W. H. Taylor. 2, J. R. Lewis.

FAKENHAM SHOW HALL.—Having heard of complaints by exhibitors of poultry respecting the unsuitable buildings which some exhibitions are held in, I think it right to state, having acted as one of the Judges at the Fakenham Show for the past two years, that the Show Hall at Fakenham is well suited in every respect for an exhibition, as it stands on an open plain, is well lighted from the sides and roof, and is well ventilated,

and I may also add that the greatest care and attention is paid to the birds.—THOMAS LYON FELLOWS, *East Tuddenham Vicarage, Horningham, Norwich.*

PORTSMOUTH POULTRY SHOW.

"A wind came up out of the sea,
And said, 'Oh, mists, make room for me.'"

WE certainly were surprised to see two Shows advertised for Portsmouth within eight weeks of each other, especially as, from the advertisements, it would seem as if they were at cross-purposes, the one against the other. But it is not in our province to go into the reasons, whatever they may be, for holding the two Exhibitions within so short a space of time. We can only conclude that in spite of all the various shows clashing, as they did last week, the mists did obey Mr. Longfellow's wishes, and made way for a new wind in the shape of an extra Show at Portsmouth, where the quality was decidedly good. There were no less than twelve shows on last week, making the average of two per day; and with Mr. Hewitt laid up, as we are sorry to hear he is, the other Judges must have been well worked. We found Messrs. Leno and Howard judging here, and very well they did their work. We never saw at any show less to find fault with, or heard so little grumbling even among the disappointed ones. We feel sure the Judges must have taken prodigious pains at this Exhibition.

The Show was held in the Fifth Hants Royal Volunteer's Drill Hall, which was most tastefully decorated with banners and flags. The birds were well attended to by Drewitt, and we especially approved of the mixture of sharp gravel with a layer of chaff over it for the bottom of the pens over the boards. There were on exhibition also some new poultry baskets of all sizes, and very moderate in price. They are made by Mr. Curry, of 34, Exmouth Road, Southsea. They have locks and keys, and a kind of curtain which draws round the inside and must prevent all tail-pulling and meddling with birds at stations, &c., besides adding very much to convenience when penning, as the birds cannot possibly escape when the basket is opened till this upper curtain is undrawn.

Brahmas, especially Light, always muster well at Portsmouth. The two colours brought fifty-seven pens on this occasion, and they opened the catalogue. In old Light Brahms Mrs. Williamson won the cup. The hen in this pen was a great beauty, one of the winning Birmingham hens we think. The second-prize pen had a large cock and fair hen; and the third also good, but wanting more leg-feather. Fourth (Turner Turner), a good square cock. In Light Brahma chickens the first were a fine well-grown pair. The second had a beautiful-shaped cockerel; and the third were also very good, though the cockerel had an indifferent comb, or might have been higher. 21 (Williamson), had a good pullet, but badly washed and dried. In Dark Brahms the first were a good pair of old birds, the cock being massive and square, and the hen a good colour and well pencilled. The second contained a fine cockerel, but his companion was poor in pencilling and colour by the side of the first. The third had a good hen, but the cock with her had a bad comb. In the £5 Brahma Selling class, the first were nice Darks; second good Lights, the cockerel especially nice in shape; third very fair. Several good and cheap pens being highly commended. *Cochins* came next. Old Buffs had only one entry. They were a good pair. In Buff chickens the winners were all good and nicely shown. 59 (Hodson), contained a capital cockerel, but the pullet lacked leg-feather. In *Cochins* (Any other variety), Mr. Woodgate won first with a pair of old Whites. The cock very white indeed and large; the hen large and white, but a little narrow in the shoulders. Coloured *Dorkings* were a nice class. The cup went to good chickens, and the second to old birds. This latter pen, though larger than the cup chickens, were rather out of condition and white in ears, as, too, were the third, though otherwise a nice pen of chickens. We dislike white ears in the *Dorkings* as much or more than in *Cochins*. Mr. Burnell's pens were empty. In the Variety *Dorking* class good Cuckoos won. They were neat in shape and fine in comb, and of a good colour. Second went to very fine old Whites, the cock very good in colour; and the third to Silver-Greys, the cock rather small or else of most exquisite colour and shape. 76 (Pasley), fair Silver-Greys, but with white ears again. *Game* were not very first-class. In old Reds no first was awarded, and the second were not very smart. Pen 81 (Winwood), had a cock with a bad back. In Red chickens the winners were well placed. In the next class Duckwings won all the prizes. There was not much between the first and second, but the hen in latter pen had a bad comb. 93 (Winwood), had a cock with a deformed head, one side being higher than the other. *Spanish* were a fair class. The first were good young birds with fine faces. Second also, but not so good in comb. *Polands* only mustered three pens. Nice Silvers were first, and good White-crested Blacks second. 108 (Edwards), good Blacks. *French* were not so good as usual. Old Crêves won first, nothing very grand; and La Flèche

second. A very fair pen. 111 (Chilton), good Crêves. 113 (Bainton), large Houdans, but much too light. The three classes for *Hamburgs* only contained seventeen pens. The first, Golden-pencilled, were nice birds. Second also fair. We preferred the cockerel in pen 118 (Cresswell), though his ear-lobes were rather small, his comb and carriage were very good, but his pullet was poorly pencilled on the breast, and the markings too coarse, still we should have placed them second. In Silver-pencilled good chickens won first, no second being awarded. In *Spankles*, Silvers were first and second, and Gold third. In the first-prize pen the cock looked sickly about the head and seemed to need care and rest. The third contained a nice pullet. In the Variety class, very fine Malays won first, being good in plumage and colour. The second award we did not like much. They were Black *Hamburgs*, the cockerel very white in face, still there was not much else in the class to go to. 132 (Ridley), good Malays in colour, but round in back. *Game Bantams* were good. In the Red class, smart Black Reds won all the prizes, and in the next class, Duckwings were first and second. We quite agreed with the awards, but had we been Mr. Entwistle we would have mated these two pens differently, changing the cock of the one to the hens of the other, and *vice versa*. Third very fair Piles. In the Variety Bantam class fair Blacks won first; badly-booted Whites (rose combs), second; and Silver-laced third. 158 (Kitchen), heavily-booted Whites, but cock very ill with roup, and his eyes all closed.

Aylesbury Ducks only one pen, which were given a second, but not worth it. *Rouens* better, the winning birds being good. In the next class Blacks won everything, the winners being small and of nice colour.

Turkeys brought four capital pens.

The Selling classes were large and the winning birds well chosen. Pheasants had a class to themselves. Lady Heathcote won first with a most splendid pair of Silvers, shown in beautiful plumage and condition. Second nice Golden.

A SPLIT in the Cabinet is frequently followed by a dissolution of the Ministry. Some time back it was reported that some differences had arisen between Mr. Barnes, the Secretary, and some of his colleagues; and it was generally anticipated there would be no Show at Portsmouth this year; but quite the contrary, some of the old Committee have elected a new Secretary and announced their Show, while Mr. Barnes and a few friends, with Captain Warren at their head, have collected their forces in opposition, taken the field before them, and held their Show. We have no desire to go into the merits or demerits of the quarrel, and shall confine our remarks at present to the Show which has just been held, and which does not appear to have suffered in the least from the opposition, a very small prize schedule having brought together 604 entries. The result we have little doubt was produced in a great measure by the popularity of Mr. Barnes, who has always managed his shows in the most satisfactory manner to the exhibitors.

The *Brahma* classes were filled, Lights with a cup to compete for taking precedence in the prize list. In the class for old birds Mrs. Williamson won with a grand pair; Mr. Maynard, second, deserved their position; third, rather closely pressed by their next-door neighbour. Chickens, a very fine class (Mrs. Drummond) winning with a good pair, sound in colour, with good leg-feathering; second and third both good and well selected. The Darks were not so numerous as the Lights: first (Rev. J. Ellis), a fine pair, old birds; second (Lingwood), a fine cockerel, beautiful in colour and nest in comb; the hen was not so good, and not up to Mr. Lingwood's usual standard. Third-prize (Peake), a splendid hen matched with a very duck-shaped cock. Pen 32, highly commended (Captain Warren), was the next best in the class. The Brahma class limited to birds under the value of £5 secured twenty entries; first and third prize went to Darks, second to a very pretty pair of Lights. *Cochins* were poorly represented: in the old Buff class Mr. Lingwood walked over with a very fine pair of old birds, and in the Any other variety Mr. Woodgate's pen was unapproachable. *Dorkings* were better, Rev. G. Hodson and Mr. Lingwood running a tight race for the first honours. In the Any other variety Mr. Cresswell's Whites and Silver-Greys had to succumb to a very fine pair of Cuckoos.

The *Game* Classes were very poor in quality. *Spanish*, 100 (Brown), first contained a heavy-faced cockerel, well shown; hen moderate; the others in the class were far behind. *Polands*, a good pen of Silvers (Hinton), first; second a fine cock, but the hen was not so good as the one in the next pen. *French* class contained a few good pens, Mr. Stuart winning with Crêves. *Hamburgs*, two or three nice pens could be found in each class. Any other variety, a good pen of Malays (Hinton) were first; a pen of Black *Hamburgs* (Long) second; and a pair of *Andalusians* were third. *Game Bantams*, the class for Reds was a good one: first (Webster Adams), a smart cockerel, deserved a better hen; second (Mr. Anus), a neat pen; third not so good as we generally get from Mr. Entwistle. The next class, two pens of Duckwings (Entwistle) were first and second;

we thought we rather liked the second pen the best, but they were in a bad position for light. Any other variety Bantams, a moderate pair of Blacks were first; a pair of White-booted Bantams, not in the best condition, second; and a pair of Silver-laced, of rather faded colour, third.

Ducks, Aylesbury, one entry; and first prize justly withheld. Rouen contained a couple of fine pens; in the any other variety some good Blacks were to be found, Mr. Kellaway winning easily.

In the Selling classes a few good bargains could be obtained. A pair of White Cochins second, shown very dirty and in poor condition, were eagerly sought after; two or three pens of Dorkings were also well worth the attention of purchasers.

Pheasants were a magnificent lot, we rarely see so fine a collection.

The *Pigeon* classes were all well supported. The *Carrier* classes surprised us. Single cocks: the competition was very close between the first, second, and very highly commended pens. They were very equal. The first was a little the best in beak and colour; the second had a trifle the advantage in eye. The very highly commended was the best in style, and equal in other points except colour. The Judge had a very nice task to make his selection, and we quite agree with his awards. The hens were nearly all good, but the Judge did not have the same trouble in making his choice. The young class did not please us so much. The winner had some good points, but he was a little down in face; we did not like his beak, but we thought him the best. *Pouters* obtained only six entries—two fine pairs of Whites were first and second, and a pair of Reds third.

In *Barbs* Mr. Maynard won an easy first; and second, a pen of Whites, very highly commended (307), well deserved the notice for the splendid condition in which they were shown. *Dragoons*, a grand pair of Blues, sound in colour and good in style were first, Whites second; but here we think we preferred a pen of Mr. Graham's, highly commended. The *Antwerps* were very inferior; we found one good-looking pen, but discovered a malformation in the toe of one of the birds, which shut them out of the prize list; the next we fancied contained two cocks, so that the prizes were awarded to two very moderate pens of Mr. Vigors. *Tumblers*, *Fantails*, *Jacobins*, and the any variety, were all good classes: one or two birds of considerable merit were to be found in the Selling class.

The Show was well conducted, all the prize cards were placed on the pens before the time announced for opening, and the sale-office opened punctually to time; the birds appeared to have every attention from Mr. Smith, the Superintendent of the feeding department. We very much regret the paucity of the visitors on the first day, which was occasioned by the heavy rain, which fell without ceasing from the time of opening until we returned to town.

Mr. Leno judged the Light Brahmas, Dorkings, Game, Ham-burgh, Ducks, Geese, and Turkeys. Mr. Howard judged the Dark Brahmas, Cochins, Spanish, Polish, any variety, Bantams, and Selling class. Mr. Esquilant the Pigeons.

BRAHMAS.—*Light*.—Cap and 1, Mrs. Williamson, Queenborough Hall. 2, H. M. Maynard, Holmewood, Isle of Wight. 3, J. Bradshaw, Knowle, Cranleigh, hc, R. Bird, London; Mrs. T. Turner, Ringwood, Hants. c, Mrs. T. Turner. W. M. Graham, Dunstable. *Chickens*.—1, Mrs. Drummond, Bath. 2, Mrs. T. Turner. 3, F. Rayner, Shanklin, Isle of Wight. hc, Mrs. T. Turner; — Chris-man; — Bird, Fulham; — Long.

BRAHMAS.—*Dark*.—1, Rev. J. Ellis. 2, Horace Lingwood, 3, Rev. J. D. P. Keble, hc, Seward, jnr; Capt. Warren. c — Ogilvie, F. Turner.

BRAHMAS.—*Selling Class*.—1, Turner. 2, Rev. G. F. Hodson. 3, Capt. Warren. hc, Mrs. Williamson; H. M. Maynard (2); Capt. Warren. c, F. Rayner; R. Bird.

COCHINS.—*Buff or Cinnamon*.—1, Henry Lingwood, Barkham, Needham Market. *Chickens*.—1, 2, and 3, P. Ogilvie, Hambledon. Any other variety. —1, R. S. Woodgate, Penbury. 2, H. Gibson, Brokenhurst.

DORKINGS.—*Coloured*.—1 and Cap, Rev. G. F. Hodson, North Petherton. 2, Henry Lingwood. 3, J. Lee, Oxford. hc, T. Gates, West Grinstead; P. Ogilvie. Any other variety. —1, Izard, Wokingham. 2 and 3, O. E. Cresswell, Early Wood, Bagshot. hc, Miss Pasley, Fareham.

GAME.—*Black-breasted and other Reds*.—2, W. H. T. Stagg, Netheravon. *Chickens*.—1, W. H. T. Stagg. 2, Capt. Terry, Burghfield. 3, J. Bondey, Fareham. c, W. W. Pyne, South Lancing. Any other variety. —1, H. Gibson. 2, F. Bailey, Calne. 3, W. W. Pyne. c, Capt. Terry.

SPANISH.—1, H. Brown, Putney Heath. 2, — Smith, sen, Southsea.

POLANDS.—1, J. Hinton, Warrminster. 2, T. P. Edwards, Lymington.

FRENCH.—1, H. Sturt, Pewsey. 2, Rev. N. J. Ridley, Hollington. hc, Rev. G. Chilton, Littleton; H. Sturt. c, H. Banton, Southsea; Rev. J. Holloway, Elmsworth; — Greenfield.

HAMBURGS.—*Golden pencilled*.—1, T. Faulkner, jun., Merston, Isle of Wight. 2, H. M. Maynard. *Silver pencilled*.—1, E. Long, Bromley Common. *Silver or Golden spangled*.—1, J. Long, Bromley. 2, N. Barter, Plymouth. 3, E. Boswell, Ryde, Isle of Wight.

ANY OTHER VARIETY.—1, J. Hinton (Malays). 2, J. Long. 3, W. T. Hunt, Landport (Andalusians).

GAME BANTAMS.—*Black or Brown Reds*.—1, W. Adams, Ipswich. 2, T. W. Anns, Clapham. 3, W. F. Entwistle, Westfield, Wyke. Any other variety. —1 and 2, — Entwistle. 3, — Long.

BANTAMS.—*Any other variety*.—1, R. H. Ashton. 3, Rev. G. F. Hodson.

DUCKS.—*Aylesbury*.—2, H. D. Hoare, Bitterne. *Rouen*.—1, J. Harvey. 2, Rev. G. F. Hodson. Any other variety, including *Black*.—1, J. W. Kellaway, Isle of Wight. 2, Miss Pasley. hc, Mrs. A. Wilson, Hambledon; J. W. Kellaway. hc, Capt. F. G. Coleridge, Twyford.

TURKEYS.—1, Rev. N. J. Ridley. 2, Mrs. Hawker, Sennicotts. hc, Rev. N. J. Ridley; Mrs. Hawker.

SELLING CLASS.—*Cock and Hen or Duck and Drake*.—Price not to exceed 50s. —1, H. Brown (Spanish). 2, H. M. Maynard (Light Brahmas). 3, T. Gates (Coloured Dorking). hc, T. N. Whitehead, Bridgwater (White Cochins); G. Mores (Cock, New Shoreham (Dorking); Rev. N. J. Ridley (La Fische); G. Mores

(Coloured Dorking); J. Chisman, Newick (Light Brahmas); P. Ogilvie (Cochins); J. Geo (Rouen Ducks); H. T. Hoare (Aylesbury Ducks). c, Miss Pasley (Silver Dorkings); J. Bradshaw (Light Brahmas); T. P. Edwards (Polands); Capt. Warren, Emsworth (Light Brahmas).

SELLING CLASS.—*Hen or Pullet*.—Price not to exceed 10s. —1, T. Gates (Dorking). 2, Mrs. Dressing, Haverhill (Cochins). c, J. Heath, Southsea (Duckwing Game). hc, — Whitehead, Bridgewater (White Cochins); C. Cork (Dorking); Lady Heathcote, Hurley Park (Andalusians); Hon. and Rev. F. Dutton, Bibury Vicarage (Game); Mrs. N. Grenville, Bulley Court (Houlin); P. Ogilvie (Dorkings); T. P. Edwards (Polands); Capt. Warren. c, S. Newick, Hinton St. George; T. P. Ogilvie (Dark Brahmas); H. M. Maynard (Gold-pencilled Hamburgs).

SELLING CLASS.—*Cock or Cockerel*.—Price not to exceed 30s. —1, H. M. Maynard (Light Brahmas). 2, F. J. Saltmarsh, Chelmsford (Partridge Game). 3, Capt. Warren (Dark Brahmas). hc, Mrs. Wyld (White Cochins); S. Newick (Silver-spangled Hamburg); P. Ogilvie (Cochins); T. P. Edwards; — Smith, sen. (Andalusians). c, F. M. Whitehead (White Cochins); C. Cork (Dorking); C. E. Herrieff, Banbury (Spanish).

PHEASANTS.—1, Lady Heathcote. 2, J. Baily, jun., London. hc, J. Willis T. Simmons; J. Body, Withersham.

PIGEONS.

CARRIERS.—*Cock*.—1, H. M. Maynard. 2, J. H. Ivimey, Basingstoke. hc, S. Harding, Fareham. hc, H. M. Maynard; H. Jacob; W. Quickfall, Shanklin. *Hen*.—1, J. H. Ivimey. 2, S. Harding. hc, H. M. Maynard; R. Jacob; R. Cant, London; W. Quickfall; S. Harding. *Young Cock or Hen*.—Cap, 2, and 3, H. Jacob. hc, Mrs. Ladd, Calne; H. M. Maynard; H. Jacob; R. Cant (2); W. Quickfall.

PUTERS.—1, H. Pratt, Hampton in Arden. 2 and 1 hc, Mrs. Ladd. **BARBS**.—1 and 2, H. M. Maynard. hc, J. Baily, London.

DRAGONS.—1, Rev. G. F. Hodson. 2, H. Jacobs. hc, F. Graham, Birkenhead (2); D. Barnett, Brixton; W. H. Boys, Fareham; H. Yardley, Birmingham.

TUMBLERS.—1 and 2, J. Ford, London.

ANTWERPS.—1 and 2, Mrs. Vigor, Southfield.

FANTAILS.—1 and 2, H. M. Maynard. hc, F. W. Loversidge, Newark.

JACOBS.—1 and hc, H. M. Maynard. 2, C. Parsons, Dorchester.

ANY OTHER VARIETY.—1, W. Jacobs, Sandown (Archangels). 2, Rev. J. Ellis, Bracknell (Ice Pigeons). hc, W. H. Miller, Walsall; R. Wilkinson, Gulliford (Archangels); H. Yardley.

SELLING CLASS.—1, J. Ivimey. 2, H. M. Maynard (Black Carriers). hc, C. Cork (Carriers); C. Reed, Cambridge (Barbs); C. E. Gittins (Black Carriers); C. S. Herrieff, Banbury (English Game). c, J. Baily (2); H. M. Maynard (Black Carriers); H. Jacob (White Dragons); W. Jacobs (Black Carriers); S. Harding (Carriers); Mrs. Dressing (Jacobus and Black Carriers). c, J. Baily.

CANARIES.

NORWICH.—*Clear Yellow*.—1 and c, Athersuch & Sons, Coventry. 2, J. Adams. hc, W. Walter, Winchester; A. Palmer; J. Adams. hc, W. Walter. *Clear Buff*.—1 and c, W. Walter. 2, Athersuch & Son. hc, J. Adams (2). hc, A. Palmer.

NORWICH.—*Yellow Variegated*.—1, J. Adams, Coventry. 2 and hc, Athersuch and Son. hc, W. Walter; J. Adams. *Buff Variegated*.—1, A. Palmer, Norwich. 2, Athersuch & Son. hc, Athersuch & Son; J. Adams. hc, W. Walter; J. Adams. c, W. Walter.

BELGIANS.—*Clear Yellow*.—1 and 2, C. & D. Carver, Landport. hc, I. S. Byerley. hc, C. Davis, Landport. *Clear Buff*.—1, I. S. Byerley. 2 and hc, C. and D. Carver. *Evenly-marked or Variegated*.—1, Mrs. Dressing. 2, Messrs. Carver. hc, J. W. Savage, Gulliford. c, C. Davis.

LIZARDS.—*Gold or Silver-spangled*.—1, A. Palmer. 2 and hc, Athersuch and Son. c, E. W. Lulham, Brighton.

SELLING CLASS.—1, T. Buckland (Fawn). 2, J. G. Quick. hc, P. Ogilvie (Belgian); Mrs. Dressing (Himalaya). hc, E. Frost (Sooty).

EAST KENT POULTRY SHOW.

If the sight of a brave man struggling with adversity was a sight for the immortal gods, surely the Committee of the Ashford Poultry Show deserves the sympathy of all poultry fauciers and exhibitors for a more fatal combination of untoward circumstances it is impossible to imagine. Desirous of increasing the goodness of their Show, they had this year materially increased the amount of their prizes, and were rewarded for their liberality by an entry of a hundred pens more than last year; but other things came in to make this a positive misfortune—they were disappointed about their pens, and at a late hour had to arrange for those belonging to the Yarmouth Society. The carriage of these to Ashford alone cost them £27; they are very excellent and strong ones, made of wood. The Show was open

for two days, and as Tuesday is market day, the second day is the one to which the Committee look to recoup themselves for their outlay; but last Tuesday was an incessant downpour of heavy rain, so that where they expected hundreds of visitors they did not get tens, and I very much fear that unless something unforeseen occurs the Ashford Poultry Show will be remembered amongst the things of the past.

As usual, a liberal prize list brought together a large collection of good birds. When Mr. Horace Lingwood exhibits Brahmas, and Mr. Henry Lingwood Dorkings, Col. Talbot Cochins, Mr. Quibell and Mr. Dring Houdans and Crèves, it will be at once seen that birds of no ordinary merit were exhibited, and, as usual, there were complaints about the judging. I feel convinced that if poultry shows are to stand their ground (and I doubt it) there must be some other plan adopted in arranging about the judging. No one can be a better judge of Dorkings and Brahmas than was one of the Judges at Ashford, but in French fowls it is quite clear he is a novice, and I believe would say so himself, and I must say the discontent exhibited at the judging in some of the classes was not unreasonable.

Of *Dorkings*, Coloured and Silver-Grey, there were sixty-seven entries. Mr. Lingwood's hens were very fine birds, and so were those of Mr. R. Cheesman, good specimens of Mrs. Arkwright's strain. His cockerel deserved, I think, a better position than he obtained. He is a fine coloured bird of Mrs. Arkwright's breed, perhaps not in quite as good condition as he might be. The White class was a good one; but were I to go in for Dorkings I should prefer the Silver-Greys, of which some fine birds were shown by Mr. F. Cheesman and the Rev. T. E. Cato, who pretty well swept the board. *Spanish* were a small class, only two pens being exhibited in cock-and-hen class. The *Cochin-China* class contained the splendid birds of Capt. Talbot, which carried all before them, beating Mr. Woodgate and others. Of *Brahmas* there were nearly forty entries, and here the grand Crystal Palace birds of Mr. Horace Lingwood carried off the first prizes in the Dark class, and Capt. Saville, of Wye, in the Light class. The *Game* classes (fifty-two entries) were very excellent. Mr. Brahm's (145) was a fine thoroughly well-shaped bird. The *Hamburghs* in their various classes were good. *Polands*, as everywhere, declining in numbers and quality. The judgment in *Orpingtons* was very odd, the best birds in the Show, those exhibited by Mr. Dring, and which have made their mark elsewhere, were utterly unnoticed. *Houdans* were better than ever we saw them at Ashford, birds which a year or two ago would have obtained prizes being quite passed by. Mr. W. O. Quibell obtained first with a very fine pair of birds, Mr. Lake being second with some birds bred in 1873, well crested and in good condition. Most of the pens in the chicken class contained good birds, Mr. Dring's being very fine, an indication that this popular breed is being maintained. *Bantams*, *Pigeons*, and other classes were well represented. The arrangements for feeding the birds, &c., were excellent, and the only drawback was the terrible downpour of rain, which from morning till night continued without a moment's cessation; and while it filled the springs of the neighbouring country, must have suggested thoughts of *draining* to the members of the Committee as they calculated receipt and expenditure.—D., Deal.

DORKINGS.—Coloured.—Hens.—1, Henry Lingwood, Barking, Needham Market. 2, R. Cheesman, Westwell, he, H. Mills, Dorking; G. W. Greenhill, Ashford. Cock.—1, G. W. Greenhill. 2, B. K. Thorpe, Charing. he, C. Ratcliffe, Womelsawold.

DORKINGS.—Coloured.—Pullets.—1, Henry Lingwood, 2, G. W. Greenhill. Cockerel.—1, E. Rice, Sandwich. 2, K. Cheesman. he, T. W. Stratford, West Malling; R. B. Curtes, Tenterden. he, E. Rice; R. B. Curtes (2). **DORKINGS.**—Silver-Grey.—Hens.—1, F. Cheesman, 2, Rev. T. E. Cato, Wye Vicarage. he, Rev. E. S. Tideman, Childerich Vicarage. Cock.—1, F. Cheesman. 2, J. B. Plumtree, Wingham.

DORKINGS.—Silver-Grey.—Pullets.—1, F. Cheesman, 2, Rev. T. E. Cato. Cockerel.—1, Rev. T. E. Cato. 2, F. Cheesman. he, C. Stauchiffe. **SPANISH.**—1, J. Francis, Hillenborough. 2, Mrs. Brassy, Battle. *Chickens.*—1, T. Boulter, Clerkenwell, London. 2 and he, J. Francis. he, G. K. Chilcott, Fairlawn.

COCHIN-CHINA.—1 and 2, Capt. G. F. Talbot, Maptrease. he, R. S. S. Woodgate, Pembury, Tunbridge Wells. he, Mrs. E. Pryor, Welwyn. *Chickens.*—1 and he, Capt. G. F. Talbot. 2, Capt. Coleridge, Twyford. c, H. Stephens, Tunbridge Wells.

BRAMA POOTRA.—Dark.—Cock.—1, Horace Lingwood, Creting, Needham Market. 2, J. Long, Bromley Common. he, F. Lake, Roldersham; Mrs. Brassy. *Chickens.*—1, Horace Lingwood, 2, J. Alberry, Reigate.

BRAMA POOTRA (Light).—1, P. Haines, Palgrave. 2, Capt. W. Saville, Wye. he, G. Dowker, Sloughmouth. he, Capt. G. F. Talbot; E. Mannoch, Woodrington. *Chickens.*—1, Capt. W. Saville. 2, P. Perry, Beckley. he, G. Dowker; P. Hauoos; J. Long. he, A. Smith, Godhurst.

GAME.—Black-breasted or other Reds.—1, F. Warde, West Farleigh. 2, M. Tonkin, Wittersham. *Chickens.*—1, G. Brahm, Ashford. 2, W. Foster, Deal. he, W. Foster; M. Tonkin.

GAME.—Any other variety.—1, J. Chittenden, Ashford. he, E. Rice. c, C. J. Plumtree. *Chickens.*—1, C. J. Plumtree. 2, E. Rice. he, J. Chittenden. c, W. Foster.

GAME.—Single Cock.—1, T. L. Elliott, Ashford. 2, W. Foster. he, D. Neame, Faversham; J. H. Bayler, Ashford; F. Warde.

HAMBURGH.—Gold-spangled.—1, W. K. Tickner, Ipswich. 2, J. Long. he, T. May, Wolverhampton. he, T. E. Jones, Wolverhampton. c, J. Long. *Silver-spangled.*—1, M. J. Long. 2, J. Akerman, Witney. he, Mrs. Kingsnorth, Ashford; c, J. Mosser, Reading; J. Long.

HAMBURGH.—Gold-pencilled.—1, W. K. Tickner. 2, A. W. Gardner, Canterbury. he, W. Rabson, Witleborough. c, J. Plumtree. he, H. R. Thompson, Colshill. c, J. Body, Wittersham; J. Fox, Shepherswell; J. Ware, Faversham. *Silver-pencilled.*—1, T. Hanson, Keighley. 2, B. Norton, Town Malling. he, J. Long; B. Norton.

GREY-COCK.—1, R. A. Boissier, Penhurst. 2, W. Green. he, T. G. Ledger, Folkestone; J. Brent, Woolwich.

POLISH.—1, J. Long. 2 and he, G. J. Lenny, Lewes.

HOUANS.—1, W. O. Quibell, Newark. 2, F. Lake. he, Mrs. Vallance, Sittingbourne. he, Rev. H. H. Dombrian, Westwell Vicarage; W. Dring, Faversham. *Chickens.*—1, W. Dring. 2, F. Lake. he, Rev. H. H. Dombrian; Mrs. Vallance; M. Sandford, Martin, Dover; Mrs. C. Hill, Fexhall; W. Dring.

GAME BANTAMS.—Black-breasted and other Reds.—1, W. Adams, Ipswich. 2, F. Sandford, Upper Norwood. he, W. S. Marsh, Deal; T. W. Anns, Clapham. *Any other variety.*—1, M. V. Sandford, Martin, Dover. 2, E. T. Hughes, Pluckley.

BANTAMS.—Any other variety.—1, H. H. Stickings, Ashford. 2, R. S. S. Woodgate. he, R. H. Ashton, Mottram. c, J. Ware, jun., Faversham.

ROUEN.—1, W. Dring. 2, F. Lake. he, Rev. H. H. Dombrian. *Rouen.*—1, C. Ratcliffe. 2, J. Harvey, jun., Framington. he, F. Cheesman, Ashford. he, H. Dowsett, Ashford; F. Warde; R. Stead, Tunbridge Wells.

GREY.—1, C. Bates, Mersham. 2, J. B. Plumtree. he, R. B. Curtes; W. H. Mold, Bethersten; Dowager Countess of Aylesford, Aylesford; J. Newport. *TURKEYS.*—1 and 2, F. Warde. he, C. S. Hardy, Canterbury; E. N. Hills; W. H. Mold; Dowager Countess of Aylesford. *Young.*—1, F. Warde. 2 and he, C. J. Plumtree. he, F. Warde; Rev. N. J. Ridley, Newbury.

ANY OTHER VARIETY.—1, J. Long. 2, R. S. S. Woodgate. he, Mrs. Brassy; J. Body; C. Judson, London. Capt. W. Saville.

SELLING CLASS.—Hens or Ducks.—1, R. B. Curtes. 2, F. Cheesman. 3, R. Cheesman. *Cock or Drake.*—1, H. White, Watlington. 2, T. G. Saltmarsh, Chelmsford. 3, J. Norwood.

PIGEONS.

CARRIERS.—1, 2, and he, M. H. Gill, Ramsgate.

POUTERS.—1, 2, and he, M. H. Gill.

TUMBLERS.—1 and 2, Mrs. Gill. he and c, F. Winer, Hadlow.

FANTAILS.—1 and 2, M. Sandford. he, G. W. Greenhill; J. F. Loversidge, Newark.

HOMO ANTERPES.—1, A. Bentley, Rickmansworth. 2, W. F. Marsh. he, E. Durrant. *Chickens.*—1, W. F. Marsh. he, W. F. Marsh; J. W. Barker, Brighton; E. F. Wilson.

ANY OTHER VARIETY.—1, J. T. Sparrow, London. 2, C. Heigham, Ipswich. he, E. Durrant; J. T. Theobald, Lower Tooting.

SELLING CLASS.—1, J. Bentley. 2, F. Winer. c, F. S. Barnard.

CANTERBURY POULTRY SHOW.

This was held on December 11th and 12th. We shall give a report next week.

DORKINGS.—Coloured.—1 and 3, R. Cheesman, Ashford. 2, C. Ratcliffe, Canterbury. *Cockerel.*—1 and 3, F. Rice, Sandwich. 2, R. Cheesman. he, R. Cheesman; C. Brown, Maidstone; W. J. Russell, South Norwood Hill. c, W. J. Russell. *Pullets.*—1, J. G. Hodges, Bagshot. 2, W. Sharp, Canterbury. 3, W. J. Russell. he, O. E. Cresswell, Bagshot; Mrs. Brassy, Battle. c, E. Rice.

DORKINGS.—Silver-Grey.—Cup, O. E. Cresswell. 2, E. C. Lee, Penshurst. 3, J. P. Plumtree. he, W. K. Jarvis, Petham. he, J. Scott, Elmstead; C. Ratcliffe; F. Cheesman. *Cockerel.*—1 and 3, F. Cheesman. 2, G. E. Cresswell. he, C. S. Hardy, Chatham. he, C. S. Hardy; C. Ratcliffe; J. Boulding, Petham. *Pullets.*—1, O. E. Cresswell. 2, F. Cheesman. 3, G. Court, Canterbury. he, G. Court. he, J. S. Wacher, Woodnesborough; Rev. T. E. Cato, Ashford (2). c, J. B. Plumtree; Major W. Plummer, Canterbury.

DORKINGS.—Any other variety.—1, O. E. Cresswell. 2, H. Allen, Wood Green. 3, L. G. W. Stratford. he, H. Allen; R. Noble, Canterbury. c, H. S. Thornton. **SPANISH.**—1, J. Francis, Tonbridge. 2, A. Rape, Battle. 3, W. T. Plommer, Broughton. *Chickens.*—1 and 2, J. Francis. 3, C. Howard, Peckham. he, W. T. Greensted.

JUDGES.—*Poultry*: Rev. G. F. Hodgson and Mr. W. B. Tegetmeier. *Pigeons*: Mr. J. Percival. *Rabbits*: Mr. W. B. Tegetmeier.

DUBLIN POULTRY SHOW.

The annual winter Show took place in the Society's hall in Kildare Street. The gallery of this hall is an excellent place for such a purpose, the light good and equal, and the stationary pens well placed, and while in the hands of this model Society, under the superintendence of Mr. Corrigan (who, we would venture to say, cannot be excelled), the birds are well cared for and comfortable, the only drawback being that so far the Society has not seen fit to become responsible for the safe transition to and from the Show of the birds entered. The entry fees are too high at 6s. per pen for the prizes given, otherwise the Show would become a most popular one on this as well as the other side of the Channel. Unfortunately the Belfast Ornithological Society held its meeting at the same time, and two shows of such importance will not do well competing. We have the authority of those who know for saying this will not occur again.

After all, the entries in many of the classes were very good, the *Dorkings* proving, as usual in this country, very good; but these remarks refer more especially to the Silver-Greys, which were really very good and true to colour. Old *Spanish* good, but young only poor; while the *Light Brahmas* were but a moderate lot. Dark *Brahmas* seem to show the effects of the greatest attention both here and everywhere, both classes having

made great progress in Ireland, and there were some very grand birds in both classes. *Cochins* were good in both the old classes, but chickens were poor; there were some good Blacks. Strange to say, there were no entries for *Game*, and in *Hamburgs* the birds were poor, with the exception of the winners. *Polish* good, especially the White-crested Blacks. Some good cheap birds quickly changed hands in the Selling classes. *Turkeys* and *Aquatic Birds* are generally very fine here, and this was no exception to the rule; in fact, these were unusually good and large. *Bantams*, both *Game* and *Blacks*, were very good as regards the winners, the first in Blacks a good pair.

Pigeons were a small entry, and most of the prizes carried off by Mr. Seale; but with the exception of *Pouters* and *Turbits* they do not call for special remark.

DORINGS.—*Silver-Grey*.—1, S. Mowbray, Killeany, Mountrath. 2, Miss De Courcy Drevay, Newton Park, Co. Dublin; R. P. Williams, Glaslough, Clontarf, &c. G. N. Pardon, Lisnagar, Kilkenny. *Chickens*.—1 and 2, Miss A. M. Warburton, Rill, Stradane, Co. Kildare. *he*, R. P. Williams; Miss A. M. Warburton; J. F. Bomford, Drumlagan, Kilkenny. *c*, G. N. Pardon; W. Kerrigan, Whitefields, Phoenix Park; P. Marmion, Castleknock.

DORINGS.—*Other Coloured*.—1, P. Marmion. 2, S. Mowbray. *Chickens*.—1, J. Barlow, Castleknock. 2, W. Kerrigan.

SPANGLED.—1, R. P. Williams. *Chickens*.—1, W. G. Henry, Oaklands, Dublin. 2, R. P. Williams. *c*, Major Harvey, Wexford.

BRAMHANS.—*Light*.—1, L. Sullivan, Ballydoole, 2, Miss L. Stephens, Greenwood, Dublin. *he*, A. Field, Blackrock. *Chickens*.—1, A. Field. 2, Lord Massy, Connell. *he*, J. Forrest, Nulamore, Dublin.

BRAMHANS.—*Dark*.—1, Lord Massy. 2, Mrs. Taaffe, Foxborough, Thulsk. *he*, Lord Massy; Mrs. R. Sargent, Waterloo, Cahire. T. M. Hildard, Dublin; R. W. Boyle. *c*, Miss T. W. Webber, Hunnington, Portlinton; Miss H. M'Crath, Loughloher, Cahire. L. Stoney. *Chickens*.—1, Lord Massy. 2, Mrs. Taaffe; *he*, Miss A. M. Warburton. *he*, R. P. Williams; Miss A. M. Warburton; H. W. Boyle; Miss De Courcy Drevay. *c*, T. Mallinson, Geashill, King's County; S. Mowbray.

COCHINS.—*Buff and Cinnamon*.—*Chickens*.—1 and 2, M. Mahony, Baldoy, Dublin. *he*, Capt. St. Ivan, Loughlinstown.

COCHINS.—*Partridge and Brown*.—1, B. P. Williams. 2, M. Mahony. *Chickens*.—1 and 2, M. Mahony. 2, L. Stoney, Dublin.

COCHINS.—*Black*.—1, Mrs. Taaffe. 2, C. Teuch, Dublin. *Chickens*.—1, Mrs. Taaffe.

COCHINS.—*Any other colour*.—*Chickens*.—2, Mrs. Harvey, Wexford.

HAMBURGERS.—*Pencilled*.—1, S. Mowbray. *Chickens*.—1, W. J. Barlow. 2, S. Mowbray. *he*, C. Pressly, Chapelizod.

HAMBURGERS.—*Spangled*.—1, S. Mowbray. 2, L. Stoney. *Chickens*.—1, S. Mowbray. 2, L. Stoney.

WHITE-CRESTED BLACK.—1, Miss De Courcy Drevay. *Chickens*.—1, Miss De Courcy Drevay.

J. A. FLECH.—1, A. Field.

HODDANS.—1, E. Morrison, Parsonstown. 2, C. M'Glenn, Dublin. *Chickens*.—1, L. A. Beamish, Annamont, Co. Cork. 2, C. M'Glenn.

CREVE-COEURS.—1, T. M. Harvey, Wexford.

ANY OTHER VARIETY.—1, S. Mowbray (Black Hamburg). *Chickens*.—1, Mrs. T. W. Webber (Blue Andalusian). 2, S. Mowbray (Black Hamburg). *he*, T. France, Cullinstown, Dublin (Brown Leghorns).

SELLING CLASS.—1, Miss Stephens. 2, J. Barlow (Golden-pencilled Hamburg). 3, J. Holvey, Dublin (Spanish). *he*, Miss Stephens; Mrs. E. Green, Dublin (Spanish); Mrs. T. W. Webber (Dark Brahma); M. Mahony (Partridge Cochins); Mrs. Taaffe (Black Cochins). *he*, Miss Stephens; W. G. Henry; Miss A. W. Warburton; G. A. Perrin, Chantilly, Loughlinstown; Mrs. R. Sargent (Dark Brahmas); S. Mowbray; W. Kerrigan (Silver-Grey Dorings); M. Mahony (Buff Cochins); Major J. Harvey (White Cochins); R. W. Boyle (Dark Brahma). *c*, Major J. Harvey (Spanish); R. W. Boyle (Dark Brahma); Mrs. Taaffe (Dark Brahma).

SELLING CLASS—Single Cocks.—7, M. Mahony (Buff Cochins). 3, J. Barlow (Coloured Dorking). *he*, Lord Massy (Dark Dorking). *he*, Miss A. M. Warburton (Silver Grey Dorking); S. Mowbray (Dorking); Mrs. Taaffe (Dark Brahma); W. G. Henry (Spanish). *c*, Miss L. Stephens; R. P. Williams.

THREE FAT FOWLS.—1, S. Mowbray. 2, Miss E. Hildard, Dublin. *he*, R. P. Williams. *c*, L. Stoney.

BANTAMS.—*Game*.—1, W. Moyley. 2, G. Knaggs. *Any other variety*.—1 and 2, Miss Stephens.

TURKEYS.—1, Mrs. T. W. Webber. 2, S. Mowbray. *he*, Miss H. M'Crath; Miss L. King. *Young*.—1, S. Mowbray. 2, Miss H. M'Crath. *he*, C. H. Peacocke, Belmont. Co. Wexford; J. F. Bomford, Drumlagan, Kilkenny. *Single Cock*.—1, J. F. Bomford.

GESE.—*Emulsion*.—1 and 2, S. Mowbray. *Toulouse*.—1, R. P. Williams. *he*, Miss L. Booth, Ballydoole, Castleknock; S. Mowbray. *Any other variety*.—1, T. A. Bond, Londonderry. 2, R. P. Williams. *he*, R. P. Williams; T. A. Bond.

J. F. Bomford. Young.—1, S. Mowbray. 2 and 3, G. A. Perrin. *Two Fat Geese*.—1, S. Mowbray.

DUCKS.—*Rouen*.—1, Mrs. Taaffe. 2, Miss Stephens. *he*, R. P. Williams (2); M. Mahony; R. W. Boyle. *Aylesbury*.—1, Miss A. Warburton. 2, G. A. Perrin. *he*, J. F. Bomford. *he*, R. P. Williams; Lord Massy; Mrs. T. W. Webber; C. H. Peacocke; S. Mowbray.

SELLING CLASS—Ducks.—1, Lord Massy. 2 and 3, S. Mowbray. *he*, R. P. Williams; Lord Massy (2); J. F. Bomford.

FANCY, ORNAMENTAL, OR WATERFOWL.—1 and 2, R. P. Williams.

PIGEONS.

POUTERS.—1, E. A. Seale, Kilgobbin, Dublin. 2 and 3, F. W. Zurichorst, Bellevue, Donnybrook. *he*, L. Stoney (2).

TUMBLERS.—1 and 2, E. A. Seale. *he*, W. F. Forrest.

BAIDS.—1, E. A. Seale.

FANTAILS.—1 and 2, E. A. Seale. *he*, W. G. Henry.

JACOBIANS.—1 and 2, E. A. Seale.

TURBITS.—1, W. G. Henry. 2 and 3, E. A. Seale.

TRUMPETERS.—1, E. A. Seale. 2, F. W. Zurichorst.

OWLS.—1 and 2, W. G. Henry. *he*, G. W. Painter, Hollywood, Dublin.

HOMING.—F. W. Zurichorst. 2, E. A. Seale.

DRAGONS.—1 and 2, W. G. Henry.

FENS.—1 and 2, E. A. Seale.

ANY OTHER VARIETY.—1, W. G. Henry (Helms). 2, E. A. Seale (Hunts).

MAGPIES.—1 and 2, E. A. Seale. *he*, W. G. Henry. *c*, F. W. Zurichorst.

SELLING CLASS.—1 and 2, E. A. Seale. *he*, W. G. Henry. *c*, F. W. Zurichorst (2); F. G. Holvey.

JUDGES.—Messrs. Hutton, Padsey, near Leeds; Staunton, Sandymount, Dublin; and Merry, Blessington.

finally settled and confirmed. Prizes to the amount of £2096 are offered by the Society in the several departments of stock, poultry, &c., and the list will be augmented by the offer of £235 by the Croydon Local Committee and the Committee of the East Surrey Agricultural Society, in champion prizes for superior excellence, irrespective of class. In the poultry classes entries must be on or before the 4th of May.

BURSLEM POULTRY SHOW.

THE second annual Show of Dogs, Poultry, Pigeons, Rabbits, and Birds was held in the covered market and Town Hall, on Wednesday and Thursday, December 9th and 10th. There were about 711 entries in the entire Show, made-up as follows:—Dogs 215, poultry 292, Pigeons 133, Canaries 56, and Rabbits 16. The Exhibition was a fine one, and was carried-out as well as the unfortunate mistake of the non-arrival of the pens for a portion of the poultry and Pigeons would permit, in a satisfactory manner.

The classes for *Game* fowls were the heaviest filled, and contained many fine birds. There were a few good pens of Gold and Silver-spangled and Pencilled *Hamburgs*. There were several good pens of *Bantams*. The Selling class contained many good birds. There were nine pens of *Rouen Ducks*, eleven of *White Aylesbury*, thirteen of any other variety, eleven pens of *Geese*, six of *Turkeys*, and three local classes, the first of which contained twenty pens of various breeds, the second for *Hamburgs* with eight entries, and the third class for *Bantams* of any variety, in which we noticed several showy pens in the twenty-one entries.

The *Pigeons* looked tolerably well throughout the classes, there being several first-class *Carriers*, *Dragoons*, *Pouters*, *Tumblers*, *Fantails*, *Jacobins*, and other breeds.

Rabbits were not very numerous, but the quality in some instances was good.

The *Canary* classes were moderate in some instances. In the two classes of *Belgians* the first-prize birds in each were worth breeding with. The *Norwich*, *Lizard*, *Mules*, and *Brown Linnets* and *Goldfinch* classes were very good, particularly as to quality. One of the *Goldfinch* and *Canary Mules* was disqualified through having been trimmed in the tail. It belonged to Mr. John Caskiment, Newcastle, Staffordshire.

SPANISH.—1, H. Wilkinson, Earby, Skipton. 2, J. Mansell, Longton. 3, T. Roughton, Burslem.

DORINGS.—*Coloured*.—1, J. Walker, Spring Mount, Rochdale. 2, J. Stott, Healey, Rochdale. 3, W. Mirfitt, Goole. *Any other variety*.—1, W. Mirfitt. 2, L. Wren, Lowestoft. 3, W. Rowe, jun., Newark.

COCHINS.—*Cinnamon and Buff*.—1, J. Walker. 2, H. Goodfellow, Macclesfield, Newcastle. 3, W. H. Crave, Etwall. *Any other variety*.—1, T. Stretch, Ormskirk. 2, C. Wils, n. Elton. 3, J. Gunn, Coalville.

BRAMHANS.—*Dark*.—1, J. Pownell, Middleswich. 2, T. F. Ansell, Cowley Mount, St. Helens. 3, C. Coppack, Chester. *he*, Messrs. Bridgewater & Yoxall, Wednesbury; W. Gadin, Market Drayton. *c*, — Bridgewater & Yoxall; Hollbrook & Knowles, Derby. *Light*.—1, J. Steele, Leek. 2, W. J. Storer, Penkridge. 3, C. Wilson.

TOLANS.—*Any variety*.—1, G. W. Boothby. 2, Mrs. Pover, Burslem.

BEST AND MOST VARIED COLLECTION OF BIRDS.—1, J. Munro. 2, A. Mathieson.

RABBITS.—Pair.—1, D. Dorward. 2, H. Davidson, Montrose.

BELFAST POULTRY SHOW.

The offer of a good list of cups and money prizes will bring a good show together, even on the other side of the Irish Channel, and the Belfast Ornithological Society has no reason to repine with such success achieved in the face of one show in Ireland, and perhaps near a dozen in England at the same time, though we do not think the time chosen the most opportune that could be. The Ulster Hall is an excellent place for such a gathering, the room being lofty and light. Turner's pens were used, and being well placed, made an excellent display of the occupants. In most of the classes the English exhibitors had been very wary, and had sent excellent birds; but even these had plenty of work with the stock of our Irish friends, as will be seen from the prize list.

In Dorkings Mr. Mulligan headed the list with a good Dark cockerel, also taking the cup for the four classes, most of the other birds being rather defective in feet. The hens were a good lot in the Dark, but the Light or Silver-Greys did not show up well in quality. Cochins, Buff, brought some grand birds. In cocks a grand old bird was awarded first position; the second, a cockerel, was very grand in feather and colour; but the former was beaten for the cup for cocks by a handsome well-developed Partridge shown by Messrs. Crabtree, the second here being White. In hens, Buff, were some grand birds. The first a most grand bird in shape and style, a little flecked with unmottled feathers, was awarded the cup, and being in catalogue at a low price she was sold at once. The second and third were grand coloured birds. In the next class the first was a large white, second a Partridge not so large, but more shapely. Brahmans also turned up well, there being four cups. The Dark cocks were good. A cockerel, in price only £3 3s., won, and was at once sold; second and third were old birds. In hens Mr. Leno's exquisitely-marked pullet was first-and-cup, Mr. Crabtree's large old hen second; and there were many other very excellent hens in the class. Light Brahma cocks were only

good as regards the winners, and the same remark applies to the hen class, but the noticed birds were very good. *Spanish cocks*.—First a large deep-lobe cock, rather rough, as also the second; the third was unusually fine in face, but a little slack in comb (being a cockerel), must make a grand bird. *Hens*.—First a hen very fine in face, but not deep in drop. In *Game*, Black Reds, the first was a very strong cockerel, not so fine, however, as the second, nor so good in colour, but the latter was very much Goose-winged. In *Hens* of that kind two pullets won first and second. The first, very fine in all points, won also the cup for *Hens*; the second was a grand pullet, but had a badly-twisted comb. In *Game*, Brown Reds, cocks were poor, but *Hens* very good. In Any other cocks a Pile stood first-and-cup, a grand cockerel in all points, a Pile also standing very clear in the *Hens*, *Houdans* were a fair lot, but the next French class much better, the cup going to a grand pen of La Flèche, and second to Crève-Cœur. Excepting in a few cases we cannot compliment the exhibitors upon the quality of *Hamburgs*, but some of these were good, especially the Gold-pencilled cup cockerel and the cup pen of Gold-spangles. Blacks were, however, very good. In *Polish*, the first and third were Silvers, and second Black, all good. The first-prize cock and third-prize pullet were real gems, as also the pair of Blacks. *Game Bantams* poor, except first pen, but Sebrights exceptionally good; the first Silver, and second Gold. In Blacks the first stood out from the rest, and were an exquisite pen, and the cup was awarded here. The *Selling classes* were large, and many birds were sold. *Ducks*, Rouen, came next, and the cup for aquatic birds was awarded here to a remarkably fine pen, the second being also good, but the Duck evidently an old one. *Aylesburys* were large, but not well shown, being mostly dirty. Mr. Sainsbury showed a grand pen of Black East Indian, which were small and neat in all points. Of *Turkeys* and *Geese* there were two pens each, the *Turkeys* not large, but the *Geese* very good. The first and second Toulouse.

In *PIGEONS* the prizes were very good—twenty-one cups, and in most classes £2, £1, and 10s. in each, which, taking into consideration the much easier manner in which they can be conveyed, is quite double the inducement offered for poultry, where only eighteen cups and the same amount in prizes were offered. There were forty-one classes for poultry and forty-five for Pigeons. In the first there were 424 entries, and in the latter section 340 entries. Surely our Irish friends are becoming quite enthusiastic in the Pigeon fancy. The quality of the birds, as may be expected with such a list, Mr. Montgomery's birds adding quite an embellishment to the first part of the high class section of the Show, this gentleman and a few Scotch fanciers giving Mr. Fulton quite a turn-up. The *Pouters*, with eight classes, were quite a show in themselves. In *Carriers* we noticed a grand young Black cock obtained a first position, this being one of the strongest birds we have ever seen, but, perhaps, a little short at the back of his eye. Some demurred to the award, which we consider was rightly made. Mr. Fulton's Dun cock so well known obtained a first position, but the cup for this section went to a good Dun hen. *Tumblers* and *Barbs* showed-up well. *Trumpeters* yet show a want of foot-feathering, so much needed to complete the appearance of the new variety. There were some good *Fantails* in both classes, and the awards well made. In *Dragoons* we considered the awards in Blue and Silver as coming it too much of the Horseman style, many grand birds, such as Messrs. Graham, Gamon, and Staunton showed, being passed over unnoticed. In Any other colour we thought the first and second better made. In *Antwerps* Mr. Gamon won with some good Short-faces, but Mr. Wright's excellent Silver Dun was only commended.

DORRINGS.—Coloured, except Silver-Grey.—Cock.—1 and Cup, W. G. Mulligan, Belfast. 2, W. H. King, Rochdale. 3, W. H. Crabtree, Manchester. *Hen*.—1 and Cup, W. H. Crabtree. 2, Lord Massey, Limerick. 3, Mrs. Brennan. *hc*, Lord Massey; W. G. Mulligan (2); J. Pollock, Dundonald; W. H. King (2); W. H. Crabtree.

DORRINGS.—Silver-Grey or White.—Cock.—1, W. H. King. *Hen*.—1, Miss de C. Drevau, Dublin. 2, W. H. King. 3, J. Firth, Belfast.

COCHINS.—Buff or Cinnamon.—Cock.—1, H. Tomlinson, Birmingham. 2, W. H. Crabtree. 3, W. G. Mulligan. *hc*, G. A. Stephens, Dublin. *hc*, L. Storey, Dublin; F. Robertson, Belfast (2); J. W. Crosby, West Bromwich. *Hen*.—1 and Cup, F. W. Zurborst, Dublin. 2, W. G. Mulligan. 3, D. Sullivan, Dublin. *hc*, Mrs. Heddie, Inverness. *hc*, A. Withers, Stranraer; Dr. Storey; F. Robertson. *c*, M. Mahony, Dublin; J. W. Crosby.

COCHINS.—Any other variety.—Cock.—1, Cup, and 2, W. Whitworth, jun., Manchester. 3, Dr. Storey. *Hen*.—1 and c, W. Whitworth, jun. 2, W. J. Mulligan. 3, T. A. Road, Londonderry.

BRAMMAS.—Dark.—Cock.—1 and Cup, H. J. McBride, Gifford. 2, A. Robertson, Kilmarnock. 3, W. H. Crabtree. *hc*, W. G. Mulligan; J. Sturt, Helensburg; J. Forrest, Dublin; M. Leno, Dunstable. *Hen*.—1 and Cup, M. Leno. 2, W. H. Crabtree. 3, J. Sturt. *hc*, W. G. Mulligan; W. H. Crabtree. *hc*, W. G. Mulligan; H. J. McBride.

BRAMMAS.—Light.—Cock.—1 and Cup, W. H. Crabtree. 2, E. J. Poor, Limerick. 3, M. Leno. *hc*, A. Field, Dublin. *c*, E. T. Herdman, Stranraer. *Hen*.—1 and Cup, A. Field. 2, J. Forrest. 3, M. Leno. *hc*, E. T. Herdman. *c*, A. Field; W. A. P. Montgomery, Belfast.

SPANISH.—Cock.—1, Cup, and 2, J. A. & M. F. Smyth, Londonderry. 3 and *hc*, W. G. Mulligan. *hc*, A. Withers; Mrs. I. Strange, Belfast. *Hen*.—1, Cup, and 3, W. G. Mulligan. 2, J. A. & M. F. Smyth. *hc*, J. & M. F. Smyth; A. Withers.

GAME.—Black Red.—Cock.—1, J. F. Walton, Rawtenstall. 2, F. W. Zurborst. 3, J. H. Lowry, Dunganon. *Hen*.—1 and Cup, Furness & Sudall, Rawtenstall. 2, C. E. McClintock, Glendarragh, Co. Antrim. 3, J. H. Lowry.

GAME.—Brown Red.—Cock.—1, J. Frame, Comer, Co. Down. 2, J. F. Walton. 3, H. Beldon, Goltstock, Bingley. *Hen*.—1, J. F. Walton. 2, A. J. Poer. 3, J. Frame.

GAME.—Any other variety.—Cock.—1 and Cup, J. F. Walton. 2 and 3, J. H. Lowry. *Hen*.—1, J. F. Walton. 2 and 3, J. H. Lowry.

HOUDANS.—1 and Cup, W. Whitworth, jun. 2, A. Withers. 3, G. W. Hibbert, Manchester. *c*, E. T. Herdman.

CRÈVE-CŒUR AND LA FLÈCHE.—1 and Cup, E. Walton, Horncliffe, Rawtenstall. 2, W. H. Crabtree. 3, G. W. Hibbert. *hc*, F. Watson, jun., Lurgan (2).

HAMBURGS.—Gold-spangled.—1 and Cup, Furness & Sudall. 2, J. Crawford, Beith. 3, H. Beldon. *hc*, Dr. Storey; A. Robertson. *Silver-spangled*.—1, H. Beldon. 2, Furness & Sudall. 3, W. Martin, Stranraer. *c*, W. J. Davison, Belfast.

HAMBURGS.—Gold-pencilled.—1, Cup, and 3, H. Beldon. 2, Furness and Sudall. *hc*, W. Martin. *Silver-pencilled*.—1 and 3, H. Beldon. 2, W. Martin.

HAMBURGS.—Black.—1 and 2, H. Beldon. 3, J. M. Wilson, Kilmarnock.

POLISH.—1, H. Beldon. 2 and *hc*, Miss Drevau. 3, W. Martin.

BANTAMS.—Game.—1 and Cup, E. Walton. 2, W. Sheuton, Lancaster. 3, J. W. Crosby. *hc*, E. R. Lucas, Belfast. *c*, W. G. Mulligan; J. Corseaden, Londonderry. *Sebright*.—1 and 2, M. Leno. 3, H. Beldon. *hc*, F. Connor, jun., Bangor, Co. Down; Miss N. Richardson, Belfast; A. Robertson. *Black*.—1 and Cup, R. H. Ashton, Manchester. 2, A. Robertson. 3, D. M. Laren, Kilmarnock. *hc*, Master M. Hilliard, Dublin; H. Beldon. *Any other variety*.—1, A. Corseaden, Belfast. 2, Mrs. H. Hutcheson, Donabate, Co. Dublin. 3, F. Watson, jun.

ANY OTHER VARIETY.—1, H. J. McBride (Malays). 2, J. F. Walton, Newtownards (Malays). 3, G. Walker (Rumpy or Chinese).

SELLING CLASS.—Cock.—Price not to exceed £1 10s.—1, Furness & Sudall. 2, W. G. Holt, Accrington. 3, W. G. Mulligan. *hc*, J. H. Lowry (Duckwing Cocker); J. Pollock (Coloured Dorking); J. F. Walton; F. Robertson (Buff Game). *hc*, C. E. McClintock (Golden-pencilled Hamburgs); H. J. McBride (Dark Brabman); W. G. Mulligan; J. Pollock (Coloured Dorking); J. Firth (Brabman); F. Robertson (Dark Brabman); Mrs. Bagwell (Grey Dorking). *c*, J. M. Wilson (Black Hamburg).

SELLING CLASS.—Pair of Hens or Pullets.—Price not to exceed £2.—1, E. Malcomson, Belfast (Partridge Cochins). 2, W. G. Mulligan. 3 and c, E. T. Herdman. *hc*, A. Withers (Houdans); J. F. Walton; Furness & Sudall. *hc*, E. T. Herdman (2); W. G. Mulligan (2); J. Firth (White Cochins); Mrs. Bagwell, Tullyhogue, Co. Tyrone (Grey Dorking).

DUCKS.—Rouen.—1, Cup, and *hc*, W. G. Mulligan. 2, F. Robertson. 3, W. B. Maxwell, Carrickfergus. *hc*, E. T. Herdman (2); W. Whitworth, jun. *Aylesbury*.—1, J. A. & M. F. Smyth. 2, T. C. Browne. 3, A. Robertson. *Any other variety*.—1, G. S. Sainsbury, Devises. 2 and 3, Mrs. Brennan.

ORNAMENTAL WATERFOWL.—Pair.—1, W. Martin.

TURKEYS.—1, F. Watson, jun. 2, Mrs. Brennan.

PIGEONS.

POUTERS.—Blue-pied.—Cock.—1 and Cup, N. Hill. 2 and 3, R. Fulton New Cross, London. *hc* and c, J. Wallace. *Hen*.—1, F. W. Zurborst. 2, 3, and *hc*, J. Wallace.

POUTERS.—Black-pied.—Cock.—1 and 2, J. Wallace. 3, R. Fulton. *Hen*.—1 and Cup, R. Fulton. 2, 3, and c, J. Wallace.

POUTERS.—Yellow-pied.—Cock.—1, J. Wallace. 2 and 3, R. Fulton. *Hen*.—1 and 2, J. Wallace. 3, R. Fulton.

POUTERS.—White.—Cock.—1, J. H. Hutchinson, Donabate, Co. Dublin. 2 and *hc*, R. Fulton. 3, Mrs. Ladd. *hc*, J. Wallace. *Hen*.—1, J. H. Hutchinson. 2, R. Fulton. 3, Mrs. Ladd. *hc*, J. Wallace. *c*, J. Ford; J. Gardner, Preston; R. Fulton. *c*, E. A. Seale; R. Fulton.

CARRIERS.—Black.—Cock.—1 and *hc*, J. Montgomery. 2 and c, R. Fulton. 3, M. Stuart. *Hen*.—1, R. Fulton. 2, M. Stuart. 3 and *hc*, J. Montgomery. *c*, J. Wallace.

CARRIERS.—Dun.—Cock.—1, Cup, and *hc*, R. Fulton. 2 and c, J. Montgomery. 3, M. Stuart. *Hen*.—1, Cup, 2, and *hc*, J. Montgomery. 3 and *hc*, R. Fulton. *c*, M. Stuart.

TUMBLERS.—Short-faced Almond.—Cock.—1, Cup, and *hc*, M. Stuart. 2 and 3, R. Fulton. *Hen*.—1 and *hc*, M. Stuart. 2 and 3, R. Fulton.

TUMBLERS.—Short-faced any other colour.—Cock.—1 and Cup, J. Forde. 2 and 3, M. Stuart. *hc*, M. Stuart; J. Forde. *c*, E. A. Seale; R. Fulton. *Hen*.—1, J. Ford, London. 2 and 3, M. Stuart. *hc*, J. Ford; J. Gardner, Preston; R. Fulton. *c*, E. A. Seale; R. Fulton.

TUMBLERS.—Common, Beards or Balbs.—Pair.—1 and 3, F. Robertson. 2, W. Shean. *hc*, J. G. Orr; F. Robertson; J. McAlpin, Belfast. *c*, J. Ford; A. A. Vander Meersech.

TUMBLERS.—Common, any other colour.—Pair.—1, J. G. Orr. 2, F. Robertson. 3, J. Forde.

BARBS.—Black or Dun.—Cock.—1 and Cup, R. Fulton. 2 and 3, W. A. P. Montgomery. *hc*, J. Dowling; J. Wallace; R. Fulton. *Hen*.—1, Cup, and 2, W. A. P. Montgomery. 3 and *hc*, R. Fulton.

BARBS.—Any other colour.—Cock.—1 and 3, W. A. P. Montgomery. 2, J. Wallace. *hc*, R. Fulton. *c*, W. S. McGibbon, Belfast. *Hen*.—1, R. Fulton. 2, W. A. P. Montgomery.

JACOBIANS.—Red or Yellow.—Cock or *Hen*.—1 and Cup, E. A. Seale. 2, W. Shean, Comer, Co. Down. 3, R. Fulton. *hc*, J. Frame. *c*, J. H. Hutchinson (2); E. A. Seale; W. Shean.

JACOBIANS.—Any other colour.—Cock or *Hen*.—1 and c, E. A. Seale. 2, J. Frame. 3, W. Shean. *hc*, R. Fulton.

TRUMPETERS.—Black.—Cock or *Hen*.—1 and Cup, R. Fulton. 2, A. A. Vander Meersech, Tooting, London. 3, J. H. Hutchinson. *c*, J. & W. Towerson.

TRUMPETERS.—Any other colour.—Cock or *Hen*.—1, J. H. Hutchinson. 2, R. Fulton. 3, J. Wallace. *c*, J. H. Hutchinson; A. A. Vander Meersech.

FANTAILS.—White.—Cock or *Hen*.—1, J. F. Liversidge, Newark-upon-Trent. 2, J. E. Spence, Broughty Ferry. 3, E. A. Seale; A. Robertson. *hc*, E. A. Seale. *c*, J. F. Liversidge; W. S. McGibbon.

FANTAILS.—Any other colour.—Cock or *Hen*.—1 and 3, E. A. Seale. 2, J. Kemp, Haslingden.

OWLS.—English.—Cock or *Hen*.—1 and Cup, W. J. Henry, Dublin. 2, J. Gardner. 3, R. Fulton.

OWLS.—Foreign.—Cock or *Hen*.—1, J. I. Sparrow, London. 2, R. Fulton.

TURBETS.—Red or Yellow.—Cock or *Hen*.—1 and Cup, J. G. Orr, Beith. 2 and 3, E. A. Seale. *hc*, J. & W. Towerson; R. Fulton. *c*, J. G. Orr; J. Muir, Dalry. *c*, E. A. Seale.

TURBETS.—Any other colour.—Cock or *Hen*.—1, E. A. Seale. 2 and 3, H. I. Tivy, Cork.

NUNS.—*Cock or Hen*.—1 and 2, E. A. Seale. 3, A. A. Vander Meersch. *hc*, E. A. Seale; A. A. Vander Meersch.

DRAGONS.—*Blue or Silver*.—*Cock or Hen*.—1, Cup, and 2, R. Fulton. 3, W. Gamon. *c*, C. F. Stanton, Dublin; W. Smyth.

DRAGONS.—*Any other colour*.—*Cock or Hen*.—1 and *c*, F. Graham. 2, R. Fulton. 3, W. S. McGibbon. *hc*, C. F. Stanton; F. Graham.

ANTWERPS.—*Short-faced*.—*Cock or Hen*.—1, Cup, and 2, W. Gamon. 3, F. W. Zurburth. *hc*, W. Gamon; J. Gardner. *c*, J. Wright, Manchester (2).

ANY OTHER VARIETY.—*Pair*.—1, Cup, and 3, J. Wallace. 2, J. & W. Towerson. *c*, J. & W. Towerson; R. Fulton.

SELLING CLASS.—*Cock or Hen*.—*Price not to exceed 40s.*—1, J. Dowling. *hc*, F. W. Zurburth (Runt); W. Shean (Barb). *c*, W. A. P. Montgomery (Trumpeters and Yellow Owls); A. Robertson (Blue Beard); W. Shean (Carrier); J. Waters, Belfast.

SELLING CLASS.—*Price not to exceed £5*.—*Pair*.—1 and 2, W. A. P. Montgomery (Barbs). 3, J. Forde (Tumblers). *hc*, J. Dowling (Dragons). *hc*, J. Frame. *c*, W. G. McGibbon (White Pouters); E. A. Seale (White Fantails); J. J. Sparrow (White African Owls); J. & W. Towerson.

DISTINCT VARIETY.—*Pairs*.—1, Cup, and 2, R. Fulton. 3, W. A. P. Montgomery.

COMPETITION OPEN TO MEMBERS ONLY.

POTTERS.—*Young Cock*.—1 and Cup, D. Combe, New Cross, London. 2 and *hc*, Mrs. Ladd, Calve. 3 and *c*, J. Wallace, Glasgow. *Young Hen*.—1, Cup, and 2, J. Wallace. 3, Mrs. Ladd.

CARRIERS.—*Black*.—*Cock or Hen*.—1, Cup, and 2, J. Montgomery, Belfast. 3, M. Stuart, Glasgow.

CARRIERS.—*Dun*.—*Young Cock or Hen*.—1, Cup, and 3, J. Montgomery, 2, M. Stuart.

BARBS.—*Young Cock or Hen*.—1, Cup, and 2, W. A. P. Montgomery. 3, J. Dowling, Cork.

CAGE BIRDS.

NORWICH.—*Clear*.—*Cock*.—1, Cup, and 2, G. & J. Mackley, Norwich. 3, W. Smith. *c*, J. & W. Stitt, Belfast; W. Smith. *Hen*.—1, J. & W. Stitt. 2, W. Smith. 3, G. & J. Mackley.

NORWICH.—*Marked or Variegated*.—*Cock*.—1, W. Smith. 2, 3, and *hc*, G. and J. Mackley. *c*, J. & W. Stitt; W. Smith. *Hen*.—1, 2, and 3, G. & J. Mackley. *c*, W. Smith.

BELGIAN.—*Yellow*.—*Cock*.—1, R. Hazelton, Lurgan. 2, P. Harrington, Beith. 3 and *hc*, W. Gault, Belfast. *c*, J. Elliott, Belfast. *Hen*.—1 and 2, W. Gault. 3, J. & W. Stitt. *hc*, J. Elliott.

BELGIAN.—*Buff*.—*Cock*.—1, Cup, and 3, W. Gault. 2, J. & W. Stitt. *hc*, J. Elliott. *c*, J. M. Nab, Belfast. *Hen*.—1, R. Hazelton. 2 and *c*, J. & W. Stitt. 3, J. M. Nab.

SCOTCH.—*Yellow*.—*Cock*.—1, A. Kelly, Paisley. 2, J. S. Watson. 3, J. and W. Stitt. *c*, W. Gault, Belfast; P. Dillen, Belfast. *Hen*.—1 and Cup, P. Harrington. 2, J. & W. Stitt. 3, J. Brown. *c*, J. S. Watson, Lurgan; S. Croll, Belfast.

SCOTCH.—*Buff*.—*Cock*.—1, A. Kelly. 2, S. Croll. 3, P. Harrington. *hc*, W. Gault. *c*, A. Corseaden. *Hen*.—1, A. Kelly. 2 and *hc*, S. Croll. 3, J. McDowell. *c*, W. Gault.

SCOTCH.—*Variegated Yellow*.—*Cock*.—1 and Cup, A. Kelly. 2 and 3, J. Consins, Belfast. *c*, J. M. Connell. *Hen*.—1, W. Gault. 2, J. M. Nab. 3, J. Longham, Belfast.

SCOTCH.—*Variegated Buff*.—*Cock*.—1 and Cup, A. Kelly. 2, W. Glover, Belfast. 3, W. Gault. *c*, S. Croll; J. & W. Stitt. *Hen*.—1 and 3, A. Kelly. 2, J. and W. Stitt. *c*, Miss M. A. Wylie, Belfast.

ANY OTHER VARIETY OF CANARIES.—2, G. & J. Mackley (Buff-crested Norwich). 3, J. & W. Stitt (Silver-spangled Lizard); G. & J. Mackley. *hc* and *c*, J. & W. Stitt (Silver and Golden-spangled Lizard).

MULES.—1, P. Harrington. 2, W. G. Mulligan. 3, D. H. Ellison, Belfast. *hc*, A. H. Clarke, Belfast. *hc*, T. Scully, Belfast. *c*, W. Wilson, Belfast; J. Hughes, Lurgan; R. Burns, Belfast.

BRITISH SONG BIRDS.—1, G. Jamieson, Newtownards. 2, W. Goodfellow, Belfast. 3, G. & J. Mackley. *hc* and *c*, W. A. Firth.

SELLING CLASS.—1, J. M. Nab (Yellow Scotch). 2, D. H. Ellison (Yellow Piebald). 3, J. S. Watson (Belgian Yellow).

PARROTS.—1 and *hc*, J. S. Watson. 2, D. H. Hughes, Belfast. 3, J. Typer. *hc* and *c*, Mrs. J. M. Wilson, Kilmarock.

JUDGES.—*Poultry*: Messrs. Dixon and Hutton; and for *Pigeons*, Mr. Jones.

SWANSEA POULTRY SHOW.

This Show was a complete success. It was held in the covered market. The birds were well attended to. Mr. Carr, the Steward of the poultry department, was unremitting in his attention. The birds were exhibited in Turner's pens; being placed on one height all birds stood an equal chance. The day was fine, and brought a large attendance of visitors.

The *Dorkings* were a good class, numbering twenty-one pens, the prize birds particularly so; eight pens were commended. *Spanish* only moderate, the first-prize bird good, but shown in bad condition. Black and Brown *Game* brought seventeen pens of very fair birds. We thought we saw some of the Malay in some of them. *Game*. Any other variety, seven pens, the cup was given to a pen of good Piles, a pen of Duckwings running them very close. *Cochins* were very fair, the prize pens being good. *Brahmas*, Dark, as usual, were strong classes in both old and young. Mr. Feast took the cup and third prize with good birds. There were thirteen pens of old, and seventeen pens of young birds. In Light *Brahmas* Mrs. Roll's pen 361, to which the cup was awarded, being particularly good. There were many good birds in both the old and young classes, eleven pens old, twelve pens young. *French*, Mr. Feast took the first with a bird that figured in the Palace prize list we think. Any other variety.—The pen 409, Malays, were very good indeed, and justly merited the cup awarded to them. *Game Bantams*, eighteen pens, nothing very striking; first Brown Reds, second and third Black Reds. *Bantams*. Any other variety, first and cup to a very nice pen of Silver-laced. *Game*, cockerel, the first a stylish

Black Red, second a good Black Red. There were twenty-two pens, but nothing to note beyond the prize pens. We would like our Welsh fanciers to try and get the dark eye and more of the lemon shade into their Brown Red Game cockerels' hackles: their style is good, but we do not like the colour. In pullets we thought the prizes well awarded. The *Ducks* were good, particularly the drake in the cup pen. The first-prize *Geese* and *Turkeys* were very fine. In the Selling class were some very choice and cheap pens; these were offered by auction at 3 o'clock.

The *PIGEONS* were a nice lot of ninety-four pens. Mr. Spencer, of Hereford, won the point cup. First-prize *Carrier* cock, Black, able to win in better competition. First-prize *Jacobins* were also very good; the *Fantails* an excellent class. *Barbs* poor. First-prize *Trumpeters*, English and Foreign, with good rose. First-prize *Turbits* pretty Blues.

DORKINGS.—Cup, R. Leyshon. 2 and 3, H. Feast, Swansea. *hc*, Mrs. H. H. Vivian, Parkwern; Mrs. Rolls, Monmouth. *hc*, R. Leyshon; W. Morris Llandilo; W. Bevan. *c*, J. Arabin, Nenth; J. Leyshon; W. Bevan.

SPANISH.—1, T. R. Mitchell, St. Thomas. 2, H. Feast. 3, Mrs. H. H. Vivian.

GAME.—*Black and Brown*.—1, O. John, Hafod. 2, T. A. Dean, Marden. 3, D. Morgan, Carmarthen. *hc*, W. James, Llwyn Mawr. *hc*, H. M. A. Eslick; S. Burford. *c*, G. S. Cole, Llanelly. *Any other variety*.—Cup, W. L. Blake, Llandaff. 1, D. W. J. Thomas, Brecon. 2, D. Morgan. 3, J. P. Moses, Llandaff.

COCHINS.—*Buff or Cinnamon*.—Cup, C. Bloodworth, Cheltenham. 2, J. Bloodworth, Cheltenham; H. Feast. 3, Mrs. Bidder, Wauchoerch. *c*, H. Feast. *Any other variety*.—1, C. Bloodworth. 2, R. Jones, Neath. 3, J. Hedges, Aylesbury.

HAMBURGHS.—*Gold-spangled*.—1, Mrs. Rolls. 2, T. R. Mitchell. 3, J. Carr, Hafod. *Silver-spangled*.—Cup, Mrs. Rolls. 2, Mrs. H. H. Vivian. 3, J. Carr. *hc*, T. R. Mitchell; J. Carr. *c*, H. Feast; J. Carr.

HAMBURGHS.—*Gold-pencilled*.—Cup and 1, Mrs. Rolls. 3, Mrs. H. H. Vivian. *c*, J. F. Davies, Neath. *Silver-pencilled*.—1, H. Feast. 2 and 3, T. R. Mitchell.

HAMBURGHS.—*Black*.—Cup, J. Patrick, Manchester. 2, H. Feast. 3, J. G. H. Morris, Bridgend. *hc*, J. Carr (2).

POLANDS.—1, J. Hinton, Warmistur. 2, J. Bloodworth. 3, H. Feast. *hc*, J. J. Scott, Carmarthen.

BRAHMAS.—*Dark*.—Cup, H. Feast. 2, J. H. Price, Nilton Court. 3, H. Feast. *hc*, J. Richardson, Pantgwyn. *hc*, J. Buckley, jun., Llanelly. *c*, H. Feast (2); D. Thomas; W. Bevan. *Chickens*.—1, W. Morris, Ross. 2, M. H. Dean, Cardiff. 3, H. Pew. *hc*, H. Feast; D. Thomas. *c*, Mrs. Bidder.

BRAHMAS.—*Light*.—Cup, Mrs. Rolls. 2, J. Bloodworth. 3, Mrs. Crook, Keynham. *hc*, T. A. Dean. *hc*, H. Feast. *Chickens*.—1 and 2, T. A. Dean. 3, C. H. P. Abbott, Withington. *hc*, Mrs. Crook. *c*, P. L. Green, Carmarthen; W. Harris; Mrs. Bidder; E. Lawrence, Bridgend.

FRENCH.—1, 2, and 3, H. Feast. *hc*, Mrs. H. Vivian; R. K. Penon, Ludlow; H. Feast; T. A. Dean. *c*, W. Harris; J. H. Ruby, Stourport.

ANY OTHER VARIETY.—Cup, J. Hinton. 2, H. Feast. 3, W. G. Vivian, Singleton. *hc*, N. S. Blake, Llandaff. *c*, J. Carr; W. James (2).

BANTAMS.—*Game*.—1, J. Mayo, Gloucester. 2 and 3, H. Feast. *hc*, G. Lewis, Swansea; W. Haycock, Taihach; H. Feast. *Any other variety*.—Cup, G. Holloway, jun., Stroud. 2 and 3, H. Feast. *hc*, J. W. Lloyd, Kingston; J. Bloodworth; H. Feast.

GAME.—*Cockerel*.—Cup, R. Pearson. 2, G. S. Cole. 3, T. Reece, Llandaff. *hc*, W. Haycock; W. S. Blake, Llandaff. *c*, D. W. J. Thomas; H. Feast; H. P. Price, Brecon. *Pullet*.—1, A. Jones. 2, R. Pearson. 3, W. James. *hc*, T. Reece; D. W. J. Thomas; R. Pearson.

DECKS.—*Aylesbury*.—1, J. Hedges. 2, Mrs. Vivian. 3, W. James. *Rowen*.—Cup, Mrs. Lewis. 2, J. H. Hott, St. Austell. 3, H. Feast. *hc*, Mrs. H. Vivian; R. Leyshon; T. Penrice, Kildwilly; E. Walters, St. Thomas. *hc*, Mrs. H. Vivian. *c*, R. K. Penon; J. Arabin. *Any other variety*.—1, Mrs. Rolls. 2, Mrs. Lewis. 3, T. A. Dean.

GEES.—1, Mrs. Bidder. 2, Mrs. Vivian. 3, Mrs. Lewis. *hc* and *hc*, W. James. *c*, Mrs. H. Vivian.

TURKEYS.—1, Mrs. Bidder. 2, J. A. Lyne, Newport. 3, Mrs. Vivian. *hc*, Mrs. H. Vivian; W. James.

SELLING CLASS.—1, W. Morris. 2, W. T. Lovering, St. Austell. 3, W. Bevan. *hc*, W. Bevan; W. Walters. *hc*, J. F. Davies; G. E. W. Green, Carmarthen; H. Feast (2); W. Harris, Bridgend; T. A. Dean. *c*, Mrs. H. Vivian; R. Pearson.

PIGEONS.

CARRIERS.—*Cock*.—1 and 2, P. R. Spencer, Hereford. 3, W. H. A. Miller, Walsall. *Hen*.—1, P. R. Spencer. 2, R. Pike, Swansea.

POTTERS.—*Cock*.—1, G. Holloway, jun. 2 and 3, P. R. Spencer. *hc*, W. G. Davies. *c*, R. Pike; G. Holloway, jun. *Hen*.—1, G. Holloway, jun. 2 and 3, P. R. Spencer. *c*, R. Pike; W. G. Davies.

TUMBLERS.—*Short-faced*.—1 and 2, P. R. Spencer. 3, G. Holloway, jun. *c*, W. G. Davies.

ANTWERPS.—1 and 2, P. R. Spencer. 3, J. Tracey, Pembroke.

JACOBINS.—1, P. R. Spencer. 2 and *c*, G. Holloway, jun. 3, R. Pike. *hc*, W. G. Davies.

FANTAILS.—1, G. Holloway, jun. 2, W. Morris. 3, P. R. Spencer. *hc*, W. H. Morton, Kingsholme; J. Spurrell, Carmarthen.

BARBS.—1, P. R. Spencer. 2, R. Pike. 3, W. G. Davies.

TRUMPETERS.—1 and 3, G. Holloway, jun. 2, W. G. Davies.

TURBITS.—1, F. S. Hockaday, St. Austell. 2, R. Pike. 3, P. R. Spencer.

NUNS.—1 and 2, P. R. Spencer. 3, G. Holloway, jun.

ANY OTHER VARIETY.—1, P. R. Spencer. 2, W. G. Davies. 3, G. Holloway, jun. *hc*, W. G. Davies (2); P. R. Spencer.

TUMBLERS.—*Pen of not less than Six High-flying*.—1, R. B. Burge. 2, P. R. Spencer. 3, H. W. Evans, Aberdare.

SELLING CLASS.—1, R. Pike; P. R. Spencer. 2, P. R. Spencer. *hc*, A. J. Barnes, Gloucester (2).

Point cup for Pigeons.—P. R. Spencer, Hereford.

JUDGE.—Mr. W. Cannan, Bradford.

MORTALITY IN POULTRY.

ORDINARILY six or eight per cent. of adult fowls will die disease annually, when they are kept for profit and given

stimulating diet to make them lay as much as possible. This is not surprising when we reflect that our domestic fowls are in a highly artificial condition. The production of large numbers of eggs is unnatural, being a habit induced by man, and causes a great strain on the constitution. The artificial supply of food in unlimited allowance, with no necessity for exercise on the part of the fowls, is another source of disease. In the wild state every species of bird must work for a living and procure its food a little at a time. It may be observed, also, that during the very part of the year when food, perchance, is abundant, the wild fowls are kept from laziness by the necessity of feeding their young, nature having fixed the breeding time in the flush season as regards forage. Again, the structure of fowls is so changed by ages of breeding, that the wings and legs, and whole sets of muscles connected therewith, are dwarfed by disease, while other portions of the body are made relatively larger, which impairs the general vigour by destroying to some extent the natural balance of the organisation. For these and other reasons it is to be expected that the ordinary death rate in the poultry yard will be considerable. The fact that fowls will die of old age, anyhow, when five or six—at most eight years old (in most cases)—renders it likely that a certain proportion will die annually at an earlier age. In conformity with this idea, Geese, which do not reach old age till twenty to one hundred years, do not drop off in the early years of maturity to so great an extent as hens.

The moral of the above is that novices in poultry-raising need not worry over their ill-luck, or mistrust that their management is any worse than that of their neighbours, because, perchance, a few of their fowls of two, or three, or four years old die every summer. It is to be expected unless the breed kept is uncommonly hardy, and all the circumstances are unusually favourable. Reduce the death rate as much as possible by hygienic measures rather than by medicine. Give plenty of air and sunshine, feed moderately, and promote exercise, and expect some losses in spite of all precautions.—(*Buffalo Live Stock Journal*.)

RABBIT-KEEPING.—No. 2.

The weaning hutch is built on the same principle. It is 12 feet long, 6 feet wide, and 6 feet high; four storeys in each hutch.

Fig. 153.—Weaning Hutch.

Four feet in the middle is wired to admit air and sunshine, having a large door (w) to close over the wire in bad weather and damp nights. The Rabbits are fed through the small doors (k). The back is furnished with swinging doors, the floors are inclined back, a trough is furnished at the bottom, and everything arranged the same as in the breeding hutch, except the breeding apartment, which is left out, and the whole interior of each storey is one large apartment 6 feet wide by 12 feet long and 18 inches high, in which forty young Rabbits can be kept in a perfectly healthy condition; thus the whole hutch will hold 160 young Rabbits. I set these hutches upon bricks to keep them dry, and would prefer to have the breeding hutches upon the south side of a building or other shelter from cold winds.

The Rabbits are fed at sunrise and sundown. I give dry food at night (hay, grain, &c.), and green food in the morning, such as grass, apples, turnips, &c. I prefer carrots above everything else as a moist food, and especially for young Rabbits. They cannot, in my opinion, be recommended too highly, but even carrots must be fed with a sparing hand to young stock (between six weeks and three months old) or they will be fatally injured. A piece of carrot as big as a small walnut night and morning, and all the dry food they will eat, are the rations I allow.

I keep my stock bucks in a breeding hutch. I find the apartment partitioned off for breeding does is a good thing for the bucks, as they can retire into it. Give the buck plenty of room; if you crowd him into a small place where he cannot exercise he

will soon lose vigour, and in some instances become perfectly useless. I never let my does breed in winter; I have them kindle about the 1st of May, and keep them breeding until the last of November, and from that time until the next spring I let them rest, and think I lose nothing by so doing. This is the method I employ to raise Rabbits in the open air without a building to contain the hutches.—W. F. HALLOCK, *Mattituck, Suffolk Co., N.Y.*—(*The American Pet Stock Bulletin*.)

NORTHUMBERLAND SHOW OF CANARIES AND OTHER BIRDS.

This was held in the Mechanics' Institute, New Bridge Street, Newcastle-on-Tyne, on the 4th and 5th inst. The prizes were as follow:—

- BELGIAN (Clear, Ticked, or Variegated Yellow).—1, 2, and 3, J. Ratter, Sunderland. *hc*, G. Scott; R. Hawman.
 BELGIAN (Clear, Ticked, or Variegated Buff).—1, 2, 3, and *hc*, J. Butter. *hc*, W. Pearson; J. Davison.
 BELGIAN (Clear Dun).—1 and 2, Anderson & Hardy, North Shields. 3, G. Scott. *c*, R. Johnson.
 BELGIAN (Dun-marked).—1, T. English, North Shields. 2, J. Moffat. 3 and *hc*, J. Harrison.
 NORWICH (Clear Yellow).—1 and *hc*, J. Athersuch & Son. 2 and 3, J. Adams. *hc*, J. Stevens. *c*, J. Baxter; A. Armstrong.
 NORWICH (Clear Buff).—1, 2, and 3, J. Adams. *hc*, J. Athersuch & Son (2); J. Baxter. *c*, T. Smith.
 NORWICH (Even-marked Yellow).—1 and 2, S. Pervival. 3, J. Baxter. *hc*, J. Adams. *hc*, J. Athersuch & Son; T. Cleminson. *c*, W. & C. Burniston.
 NORWICH (Even-marked Buff).—1, G. Cox. 2, J. Adams. 3, J. Athersuch & Son. *hc*, J. Athersuch & Son; J. Adams; T. Cleminson. *hc*, J. Baxter.
 NORWICH (Ticked or Uneven-marked Yellow).—1 and *hc*, J. Adams. 2 and 3, J. Athersuch & Son. *hc*, J. Parker. *c*, J. Bexson.
 NORWICH (Ticked or Uneven-marked Buff).—1, J. Parker. 2 and 3, J. Adams. *hc*, T. Tenniswood; Johnson & Armstrong. *hc*, J. Athersuch & Son (2); J. Bexson.
 NORWICH (Yellow or Yellow-marked Crested).—1 and 2, J. Baxter. 3, F. Woodward. *hc*, R. Watterson; F. Woodward; J. Baxter.
 NORWICH (Buff or Buff-marked).—1, F. Woodward. 2 and *hc*, J. Baxter. 3, R. Herdman. *hc*, F. Kuaggs; W. J. Hampton; J. Baxter. *c*, J. Hurrell; G. Cox; W. J. Hampton; F. Woodward.
 NORWICH (Clear or Gray-crested).—1, F. Woodward. 2, G. Cox. 3 and *c*, J. Baxter. *hc*, Johnson & Armstrong.
 CREST (Any variety except Norwich).—1, J. Garbutt. 2 and 3, J. Meakin. *hc*, J. Meakin (4); J. Baxter; J. Garbutt. *hc*, J. Baxter.
 LIZARD (Golden-spangled).—1, 2, and 3, R. Ritchie. *hc*, T. Haywood. *c*, G. Sorge.
 LIZARD (Silver-spangled).—1, 3, and *hc*, R. Ritchie. 2, J. Stevens.
 YORKSHIRE (Clear Yellow or Yellow-marked).—1 and 2, J. Thackrey. 3, Johnson & Armstrong. *hc*, J. Gilhespy; W. & C. Burniston.
 YORKSHIRE (Clear Buff or Buff-marked).—1, J. Thackrey. 2, R. Hawman. 3, Johnson & Armstrong. *hc*, G. Turner; J. Baxter. *hc*, M. Comer.
 CINNAMON (Yellow).—1 and 2, J. Adams. 3, G. Cox. *hc*, R. Watterson; J. Pringle. *hc*, J. Parker; J. Adams.
 CINNAMON (Buff).—1, 2, and 3, J. Adams. *hc*, J. Parker; G. Cox. *hc*, T. Harrison. *c*, G. Sorge (2).
 CINNAMON (Yellow-marked).—1, T. Tenniswood. 2, J. Spence. 3, W. & C. Burniston. *hc*, W. Matison; J. Baxter. *c*, G. Cox; J. Streets.
 CINNAMON (Buff-marked).—1, J. Baxter. 2, W. Pearson. 3, J. Hurrell. *hc*, G. Cox. *c*, G. Scott; J. Gilhespy; W. & C. Burniston.
 CANARY (Green).—1, W. Redhead. 2, H. Armstrong. 3, J. Ellison. *hc*, P. Seaton; J. Stevens; H. Armstrong. *hc*, Anderson & Hardy.
 SCOTCH FANCY (Yellow).—1 and 2, W. Clark. 3, T. Blackburn. *hc*, W. Clark; Johnson & Gaskin. *hc*, J. Stenhouse (2).
 SCOTCH FANCY (Buff).—1, H. Frazer. 2, R. Gilhespy. 3, C. Hobkirk. *hc*, W. Clark; Johnson & Gaskin. *hc*, J. Davison. *c*, J. Hewitt; W. Redhead; J. Smeaton.
 SCOTCH FANCY (Yellow-variegated).—1, T. Bruce. 2, H. Frazer. 3, W. Clark. *hc*, Johnson & Gaskin; J. Murray. *hc*, W. Wallace; J. Streets.
 SCOTCH FANCY (Buff Variegated).—1, T. Brown. 2, G. Stephenson. 3, T. Blackburn. *hc*, W. Wallace; W. Clark; J. Streets. *hc*, W. Clark; H. Frazer.
 SELLING CLASS.—1, J. Bexson. 2, J. Thackrey. 3, G. Sorge. *hc*, T. Cleminson. *hc*, J. Baxter. *c*, W. Wallace; R. Brown; J. Stenhouse (2); J. Stevens; Gales & Cooper; G. Cox; J. Ellison; J. Bexson; W. H. Batchelor.
 GOLDFINCH (Moulded).—1, G. Cox. 2, J. Lawton. 3, R. Hawman. *hc*, J. Wilcox; W. & C. Burniston; J. C. Bamber (2).
 LINNET (Moulded).—1, J. Baxter. 2 and 3, J. Bage. *hc*, G. Stephenson. *c*, W. Robson (2); W. Robinson; G. Scott; M. Waugh; J. Lawton.
 MULE (Goldfinch and Canary Variegated Yellow).—1, R. Hawman. 2, W. & C. Burniston. 3, J. Baxter. *hc*, J. Bexson. *c*, J. Soulsby; G. B. Frost.
 MULE (Goldfinch and Canary Variegated Buff).—1, J. Stevens. 2, J. Soulsby. 3, J. Purdy. *hc*, T. Tenniswood; J. Spence; J. Adams; R. Pearson. *c*, G. Stephenson; D. Hope.
 MULE (Dark Goldfinch).—1, Johnson & Armstrong. 2, G. Cox. 3, R. Hawman. *hc*, R. Hawman; G. Cox. *hc*, R. Simpson.
 MULE (Any other variety).—1 and 3, J. Spence. 2, J. Stephens.
 CAGE OF SIX, IN VARIETY.—1, W. J. Hampton. 2, J. Baxter. 3, R. Gilhespy.
 BRITISH BIRD (Any variety).—1, G. Sorge. 2, J. Baxter. 3, G. Watson. *hc*, J. C. Bamber; J. S. Stark; R. Pearson. *hc*, W. & C. Burniston; G. Cox; Gales & Cooper; W. Winter. *c*, W. Robson; J. Lawton.
 FOREIGN BIRD (Any variety).—1, A. D. Dance. Extra 1, J. S. Stark. 2, W. Maxwell. 3, W. Oakey. *hc*, G. Stephenson; J. S. Stark.

SPECIAL EXTRA PRIZES.

- Silver Medal, for Classes 15, 16, 17, and 18, R. Ritchie, Darlington.
 Silver Medal, for Classes 19, 20, 21, 22, and 23, J. Adams, Coventry.
 Silver Medal, for Class 35, J. Hampton, Darlington.
 Cup, for most points in Crested classes, J. Baxter, Newcastle.
 Cup, for Classes 29, 30, and 35, J. Baxter.
 Cup, for Classes 5, 6, 7, 8, 9, 10, J. Adams.
 Gold Medal, for most points in Show, J. Adams.

Cup, presented by the Committee, for the best bird shown by members, S. Percival, Gateshead.

Silver Medal, R. Lee, Thirsk.

Silver Medal, for Classes 3 and 4, T. English, North Shields.

Silver Medal, for Classes 1 and 2, J. Rutter, Sunderland.

Silver Medal, for Class 37, A. J. Dance.

Silver Medal, for Class 28, J. Bexson, Derby.

Silver Medal, for best Mule in Show, J. Spence, South Shields.

Silver Medal, for Classes 24, 25, 26, and 27, H. Frazer, Newcastle.

BEE-KEEPING.

I ASK you to insert an account of my experience in bee-keeping during the last four months, to encourage those who, like myself, are novices in apiculture, and to elicit hints from the more experienced which may point out defects in my management and suggest improvements for further guidance.

The old and cruel system of burning the bees from the hives to be taken up, is in full vogue in this neighbourhood. I have always taken great interest in the busy workers so mercilessly destroyed, and I made up my mind to try and save as many as I could this autumn from the sulphur pit.

Last spring I purchased a stock of bees in an ancient bell-shaped straw skep. In March I cut a hole in the top, and through this I fed the bees in April. Following the advice so often given in this Journal, I succeeded in getting the bees to take down syrup from an inverted bottle. Early in June a swarm was hived into a straw skep purchased from Mrs. Pagden, of Alfriston, Sussex, and I have since employed none but these hives. They are of good size, and being strengthened by a baud of wood to rest on the floorboard, are always dry and clean. From these two hives I took early in August in straw supers 18 lbs. and 23 lbs. of honey respectively, finding no difficulty in getting the bees to leave it by following the directions given in these pages.

The time now drew near when I was to put into practice my design of saving all the bees I could from the burning. I had taken notice of three gardens in which a goodly array of hives had been standing through the summer. I spoke to the owners about the new system of driving the bees, for new it was to them. The answer in each case was, "Well, sir, you get the bees out alive if you can; you are kindly welcome to them if the new scheme does not injure the honey." "If I show you that the honey can be thus taken free of dead bees, as it cannot be by your method of burning, for scores of bees in trying to escape the deadly fumes die in the cells—will you, then, for the future save your bees by driving them out as I shall, and by feeding them in the manner which I will point out, or by joining them to weaker hives?" Now, it is not an easy task to persuade such men to abandon the old practice and to take at once to a totally new one, and so I will not say that those whom I have tried to convert will at once adopt the humane system, but in time I am certain to prove to them the utility of it.

I had never driven a swarm of bees in my life, but I made up my mind to practise on my own two hives first, and then on those of my neighbours. I was most successful at my first attempt. The bees nearly all ascended in about fifteen minutes. The few left in the old hive soon made their escape after being confined in a shed for a short time. I intended to take all the honey, and found just over 30 lbs. with very little brood. I commenced feeding the same day, and found that from 1 to 4 lbs. of syrup was carried down in twenty-four hours, the amount depending upon the state of the weather. My bees were driven on the 12th of August.

On the 24th of the same month I was asked to take the bees from cottage No. 1. He wished eight hives taken up, mostly old stocks. Before commencing with these I turned up my own hives very carefully to note progress: they had each had about 30 lbs. of syrup in twelve days, and I was delighted to find in one hive five combs, white as snow, well stored, and reaching nearly from crown to floorboard; in the other there were six combs, not so large as the others, but equally well filled with syrup. This gave me much encouragement, and I went to work with a will at the eight hives. I drove them all into clean new ones, four on August 25th, and four on August 26th. I fetched them away in a cart each evening; I spread out the wrappers on the ground before the stands prepared for them (some facing north, some south-east, by way of experiment), and then I joined one of the two weaker to one of the stronger. This was most easily performed in the twilight without any gloves or bee-dress, I gently lifted the strong hive aside to the corner of the sheet, placed two sticks a few inches apart in the centre, then with a sharp rap I knocked out the swarm from the hive between the sticks, and instantly placed the other hive over. This I did again with the other two. At about ten o'clock I went out with a lantern and found every bee had ascended. Not a live bee was there on either sheet, and what was better still, there was not a dead one. I at once lifted the two hives on to their stands and placed a feeding bottle over each; there was a merry hum instantly, and the bottles were half emptied, and the bees flying about examining their new quarters. Early next day I went through

the same process, with like success on the morrow, excepting that from some cause I could not dislodge more than half the bees from one hive by beating. This hive was a late swarm and had very little comb or honey in it. The bees would cluster on the empty side of the hive, and would not mount to the top one. I brushed out all I could with a feather, and moved the rest with a little smoke from old rags while I was beating another hive. I was enabled to present the owner with eight hives of honey, not a dead bee among it, and in the whole only one comb broken, which I placed in a dish which stood near me in case of accidents.

I may here mention that to prevent the bees which followed the hive and those which flew out before the bandage was properly adjusted from annoying me, I placed a heap of damp burning rags to windward of my little table, and I found them most effective in driving off the bees, so much so that after beating a few seconds I was left entirely unmolested, and the cottager who had come home to his dinner was able to stand with me within the magic circle without any protection whatever. I lifted up the top hive very gently and not a bee flew out; we saw them pressing upwards in a compact mass, and in a few minutes the top hive was put in the place of the old one. I now had four new and strong colonies, increasing my apiary to six hives. I fed them as fast as the bottles were emptied, and felt that all was going on satisfactorily. The weather was in my favour, very fine and warm, and two fields of late clover were still in flower, so that my bees worked with a will to secure the last sweet contributions of the season.

It was not until the 2nd of September that I was called upon to take the bees from the garden of cottage No. 2. Here I had nine hives at my disposal; I drove six one day, and the three others next day. Here I found by experience that the heavier the hive the less trouble was there to dislodge its inmates. Ten minutes was sufficient to send most of the bees up where they were numerous and the hive full of honey, whereas twenty minutes were barely sufficient to drive out a colony from a partially empty hive. However, I succeeded in getting all safely mounted on my own floorboards on the evening of September 3rd, having made from the nine hives four strong families by joining the three weakest into one, and the others two and two together. Now my array of hives had increased to nine, and "all went merry as a marriage bell." The clover was no more, but the warm weather continued, and the bees most readily took down the syrup. I used large preserving bottles, holding 4½ lbs. of syrup.

On Monday, September 8th, I drove the six hives in garden No. 3. One hive had but a very few bees in it, and hardly any honey, the wasps had nearly destroyed this hive. The bees were kept in a kind of cupboard or grotto, in a sunny part of the garden. The hives were almost hidden by trailing ivy, which touched the tops of many of them. A more inappropriate place could not have been chosen. There was no way of getting behind the hives, and they stood fourteen in number, upon two shelves, one above the other, each hive nearly touching its neighbours. I found them all firmly glued with propolis to the boards, and the first hive I moved caused the whole apiary to be in a tumult. However, being well protected I succeeded in taking the bees from the hives marked for me. One was particularly difficult to move, and I only found out the cause when by force I detached it from the shelf. Behind it, with ivy tendrils all interwoven was a heap of splendid comb, full of honey and sealed up; this was on the open board at the back of the hive accessible to all the other bees of the apiary. Why was it not attacked and pilfered, since all parts of it were assailable? This question occurred to me, and I can only give one reason: that the bees of this hive were over-powerful in numbers. I took nearly a quart of bees from the old hive when I drove them, and at night when I fetched away my own hive I found quite a gallon of bees clustered in it. To these I joined the few from the wasp-destroyed hive, and also a very weak swarm from another hive, bearing in mind the constant advice of Mr. Pettigrew, "Have strong colonies." I found the remaining three swarms of medium strength, and therefore joined them all into one.

Thus I now have eleven hives to stand the winter. In uniting all these twenty-three swarms into nine hives I had not one case of fighting, although I did not use scented syrup with which to sprinkle the bees before casting them together. Was it that they were so terrified at the summary ejection from their homes a few hours before, that they had no wish for fighting; or that having nothing to protect in the shape of honey or brood they amicably united to begin life anew? These questions I leave for those with more experience than mine to answer.

Now, to sum-up the results of this driving and uniting. I have given altogether to the eleven hives just over 3 cwt. of sugar—that is, at an average, 30½ lbs. to each. Some have taken more, some less. The last day of October I found some of those first driven with stores weighing from 30 to 35 lbs. Thus the weight was about equal to half the weight of the syrup given, because 30 lbs. of sugar would be equivalent to 60 lbs. weight

of syrup. I also found that the two hives containing the last six swarms which were driven had exceeded in weight that of any one of the hives containing the bees from cottager No. 2. This, in spite of many colder days and nights since I commenced to feed them, clearly showing that the stronger the colony put into an empty hive, even late in the autumn, and vigorously fed, the greater the chance of success in keeping it through the winter. I also found that one hive (that which I found to be weakest from garden No. 1) was attacked the last week in September by the bees from the strong colonies from garden No. 3; I at once narrowed the entrances to all the weaker hives and found that the pillaging stopped. The syrup was again taken down, the rejection of which had first called my attention to the fact that something was going wrong. On October 6th as frosts were setting in I made all my pets cosy and warm for the winter. I had always had covers passing over the hives and tied to the posts under the floorboards, and over all caps of zinc or earthenware pans. I now stuffed the space between the covers and the hives with soft hay, and after binding all on tightly and placing straw screens before the entrances to break the cold winds, I topped all with a good bed of hay and replaced the caps and pans. All are well supplied with food, and I do not at all fear that I shall find them short of provisions until next March. I have marked the weaker ones, and shall give them extra attention in early spring.

I will only add one other matter and then look forward to be enabled to send you a satisfactory report of my eleven hives next spring. I had a misfortune with one of my own hives—the feeding bottle fitted too tightly into the block of wood, and I suppose that I shook the hive upon some occasion when inserting the syrup. I soon knew that something was amiss; first because the food was left untouched for two days, and secondly because I noticed that the bees ceased to bring in pollen. I turned up the hive, when judge my dismay upon finding that two-thirds of the combs had fallen *en masse* upon the floorboard. The bees did not seem to care to resent my interference. I, for the first time, singled out the queen in her home, she was upon the top of the heap with a cluster of bees pressing about her; I took up the piece of comb, held it against one which had not fallen, and in a very short time the bees crowded upon it, leaving the broken piece in my hand. I then quickly fetched a dish and placed all the fallen comb in it, at the same time liberating numbers of bees which it had covered. Having cleaned the floorboard I replaced the hive, the broken combs were all filled, most of them with honey, and two pieces about 4 inches square with brood. Some of the young bees crawled out from the cells into the dish; I took these two pieces of comb, lifted up the hive again, and placed them upright on the floorboard. In three days the bees again took down the syrup (no doubt after making reparations in the hive), and pollen was again brought in from the ivy flowers. On the final examination before wrapping up for the winter I found this hive nearly full of comb, and quite heavy. But where was the brood comb gone which I replaced? Not a vestige of it remained, nor was it incorporated with the other comb of the hive.

And now I think I have told all about my first attempts at bee-keeping or rather at bee-rearing. So far I hope successfully. I only now look forward to a fair honey harvest next season and an increase of my stock. Will Mr. Pettigrew kindly inform me where I can obtain the large hives described by him in the Journal of November 5th, and when I ought to uncover my hives again to inspect them?—P. H. P., *Offley*.

THE HIVE CONTROVERSY.

WILL Mr. Cheshire tell us if the contingency he predicts with regard to the so-called bar frame without the bottom rail is grounded on any actual fact, or is it a mere idea of his own? For it appears to me an impossibility for any number of bees that could suspend themselves to a single bar of the thickness usually employed to depress it with their weight, and it does not seem likely that the comb would have the effect, even if full of honey, for its formation would tend to support it.

Bees do sometimes attach the comb to the bottom rail of the frame, but it is the exception instead of the rule. I should like to know how the bottom rail assists ventilation.

Mr. Cheshire is in error when he says that the improvement to which Mr. Pettigrew alludes is, "above all others, recently introduced," for there are several introduced in his hive more recent, although, strange to say, his has the bottom rail.—P. ECHIONE.

OUR LETTER BOX.

WELLINGBOROUGH SHOW.—We are informed that Mr. F. Graham won first prize in Blue Dragons, and had a highly commended Blue Carrier cock.

DOMINIQUE PLUMAGE (*A London B.A.*).—The defect is not so great as if you had to exhibit two pullets, and had only two birds of different shades. You underline the words "best pullet;" have you one that is nearly as good that will match the cock in colour, or more nearly than the other? You state the other birds are inferior. Acting on your own verdict we should consider such inferiority as mere detrimental to success than a different shade of the same

colour. Our advice then is, if the only drawback to the best pen is the dissimilarity you name, and the two birds are plainly better than their mates, exhibit them. You should have named the breed to which your first question relates. Such a division is seen in the Malay, and in Game that have been crossed with them. We know no other breeds that show it, and it is not general in them. We should not consider it a defect in Malays. We should not like it in any other breed.

DRABMA POOTRAS (*E. C.*).—You have no certainty of getting better birds by buying of any particular strain. They may show certain points, but they will not stay earlier. It seems to us impossible that Drabma pullets hatched in March should not yet have laid. Ours have been laying some time, and they were not hatched as early. It is now the worst time of year for eggs, but if you will feed as we advise, we think you will soon have some. Let them have every morning at daybreak a good feed of barley meal or ground oats slaked with water. About eleven o'clock throw them down a little maize or other whole corn. At one o'clock give kitchen scraps or any odds and ends you have, and at four feed again in the morning. Our own experience is, that all inventions and appliances for cheap or artificial foods are productive only of disappointment. It is only while the weather is bad and the nights are long we recommend such feeding as above. Under more favourable circumstances, say in March, one of the two middle feeds may be discontinued. We advise you, in answer to your question, to begin by removing all faulty cocks as soon as their defects appear. This may be done at ten weeks old, and you will be surprised to see how few will pass muster. You will probably be left with few; these will want drafting from time to time. Bad combs will appear; some will be weak on their legs; others will grow only in height and length; and at last when they are six months old you will be surprised at the small number you have to choose from.

REMARKS.

- 9th.—Dull early, but on the whole a fine day, the wind drying the air.
10th.—Fine frosty morning; very fine in the middle of the day, hazy at night.
11th.—Very wet morning, fine before 11 A.M., fine afternoon, but rain in the evening.
12th.—Fine early, but rain before 11 A.M., and very dark about 1 P.M.; barometer very low all day.
13th.—Early morning fair, but rain again at 11 A.M., and more or less all day; cold uncomfortable day.
14th.—Fine in the morning and moderately so all day, but with occasional spurts of snow.
15th.—Cold morning, house-tops covered with sleet; and, though fine, very cold all day.

A week remarkable for sudden changes of barometric pressure and rather low readings. Temperature low and steadily falling. Heavy snow between midnight of 15th and early morning of 16th, averaging three inches deep.—G. J. SYMONS.

COVENT GARDEN MARKET.—DECEMBER 16.

A STEADY demand for articles of general consumption, but no alteration otherwise. Continental goods are freely supplied, with the exception of Pears, which are somewhat early in ripening—a remark which applies equally to those of home-growth this season, such as Nelis d'Hiver, Jean de Witte, and Ne Plus Meuris especially; and Glou Morceau being nearly over.

From observations taken near London during forty-three years, the average day temperature of the week is 42.6°; and its night temperature 33.1.

VINE-PRUNING AND WINTER-DRESSING.—No. 2.

MY last paper referred almost entirely to young Vines: a few thoughts may be now seasonably directed to the treatment applicable to older canes, which may have covered the roof for years. This is just the period that amateurs' (that is, unforced) Vines require attention. Vines for earlier work are of course dressed and finished for their resting period. To such these grains of instruction do not refer, as they are already in the hands of competent men who give the necessary attention peculiar to the state of the Vines and requirements. But in the matter of cool-grown unforced Vines no unnecessary delay should be permitted in pruning after this period. A good rest is the best preparation for future work. Winter pruning is frequently unreasonably deferred, and is the main source of the bleeding which so often perplexes the uninitiated in practical Grape-production. This procrastination is traceable mainly to either of these two causes—the owner has not confidence to use the knife himself, or has not a man within call to whom he can comfortably entrust the work. We will seek to help him over the difficulty. In such a case the combined observation of master and man—the exercise of their thinking powers—a sharp knife and a number of the Journal, will aid to a right diagnosis and the treatment to apply suitable to the particular case under consultation.

Vines which on the single rod have reached their full extremity, and have been spurred close in, and still go on bearing, showing no signs of waning vigour and productiveness, prove that past treatment has been right, and that any change of system would be extremely imprudent. Such Vines will be in a border not made of light turfy loam, which nurse up Vines characterised by quick fame and quick failure, but are in more solid lasting stuff of an infinitely better sustaining power. Such Vines will carry short-jointed wood, and show their bunches at the third, or at the most fourth, leaf. Vines in that state invite close pruning—as close as you like; and if the border is dressed every autumn with a thick covering of good spit manure, and lightly, very lightly, pointed-in the following autumn with a dressing of bones and good loam, previous to putting on the manure covering, it is impossible to say how long such Vines will retain their pristine habit of fruitfulness. They are in a first-rate state, and will bear a lifetime. Alter nothing. Stand firm on the plan that serves well. However, only about one vine in two is in that good state.

Let us look at another and common type. The Vines have been regularly spurred for years: they used to bear well, but latterly have failed. They grow freely enough—too freely. They have stont tendrils, large spreading, but thin and rather flimsy foliage, make gross shoots, but are shy at showing bunches, which they only do at the fifth and sixth leaf. Short-spur pruning of such Vines is not the best—the Vines themselves tell that as plain as Vines

can speak. Just take one of the free-growing shoots outside the house, and train it in the full sun to ripen. Shorten it but very little, and ten to one it will show bunches at every eye. The roots of such Vines have eaten out the dainty food of the light turfy border, which has not been replenished by top-dressings, and have gone below on a foraging expedition. They find something, but it is very crude, and require to make much foliage to elaborate, purify, and nourish. They cannot do this under a system of close pruning and pinching. They may be brought back to a state of fruitfulness by spurring, but the remedy must be applied to the roots. Remove old soil and apply fresh, give a moist surface heat by fermenting material, and a network of feeders will soon be there, and may be enticed upwards to any height required. Get these to the surface, and keep them there in sweet nourishing soil, and the top growth will change to short-jointed robustness, and the foliage will become dark, thick, and of leathery texture, of medium size. With that practice, well and carefully done, a young shoot may be trained from the bottom of the old rod, and be treated as a young Vine on the spur plan, and good fruit is certain.

We will assume, however, that this heated top dressing cannot be given (neither should it, except under the eye of a thorough practicalist), and see if Grapes cannot be got by a less simple means—that is, by a looser freer plan of pruning. Let some young shoots be laid-in at intervals much after the manner of Peach-pruning. Spur some, but leave some. In the meantime start another cane from the bottom for a new Vine. Take away surface soil, and replace with a foot of spit manure. Let the new shoot have light. Avoid overcrowding as a scourge, but let it be avoided by disbudding and leaving a few shoots, rather than by letting many push and attempt to keep them within bounds by pinching. There is a vast difference between those two plans preventing overcrowding to be kept in mind. It is a vital difference. It amounts to this: Letting young wood grow freely, but very thinly, instead of letting eyes push in all directions to be stubbed-in continually to get light, but is in three weeks darker than ever. Which is the sensible plan to get fruit from a long-jointed exuberant-growing Vine? Surely by very thin relays of young wood, having light and air to mature it, and a removal of useless rods and spurs. If a Vine will make exuberant growth it must have room to grow. I know of no other rational way of treating it. Let it have room to extend new canes, and light and air to mature them, and I have never yet seen an instance where Grapes did not follow. I am not of those who advocate the spur system on the one hand or the extension plan on the other as being the best under all circumstances. I admit no solitary inflexible rule as applicable in all cases. Each plan is right when rightly applied, and of this the Vines are the best, the surest index. Lead them, if possible, into the condition required, and if this cannot be done, follow their dictates, and profit by their suggestions. A Vine takes an immense time to wear-out by the plan of renewal by young

rods as required, and good root top-dressings of sound food.

To summarise: Vines which make short-jointed wood, which show fruit mostly at the third leaf, and carry thick dark foliage of medium size like the Fig, may be cut-in close to the old wood. Vines long-jointed, showing only at the fifth and sixth leaf, and carry light flimsy foliage like Rhubarb, will be the better for relays of young wood, gradually removing the old spurs and rods, and, above all things, to guard against the remotest chance of overcrowding. That is the best advice I can give to amateurs—advice founded on close and extended observation and a lifetime of practice. In cutting, let it be done clean, square, and smooth, without split or splinter, and a little lead paint rubbed in at pruning time will prevent bleeding at bleeding time.

A word as to peeling the canes. There is a great deal too much of this. It is very nice for a "day's-work" gardener to scrape and peel and pickle a rod a-day. It would often be cheaper to pay him to go to bed. When Vines are clear of filth close-peeling the stems is altogether unnecessary. A tight grasp and rub round by the hand will remove all loose bark necessary to come away; moreover, Vines treated in this way will require less and less bark removed every year. Layer will form on and be interwoven with layer, forming a close covering of fibre which is not without a use. Rods peeled to the very wood one year will look to require it the next—that is, bark does not adhere so closely to wood as bark to bark; and, unfortunately, the peeling and scraping often has gone below the surface of the wood. That can never be done without injury; and, as a matter of fact, I have seen injury almost fatal follow this picking and scraping with a vengeance. If, however, Vines are infested with filth, especially thrips, there must be a careful removal of bark to eradicate the insect pest. Peeling should then be regarded as the lesser of two evils. What does bark do? It preserves the ascending sap at an equable temperature by its non-conductibility: the sap floats under this Nature's covering safe from the sudden fluctuations of heat to cold and cold to heat without. It also absorbs a measure of moisture, facilitating in no insignificant degree the free breaking of the eyes in spring. Smooth glassy-polished rods are almost invariably irregular in pushing the eyes, and the young growth of such Vines will flag under a bright sun, and curl under a low night temperature more decidedly than when the ascending sap is protected by its natural shield. That is because it must be so. The advice, therefore, to my amateur friends (generally desperate scrapers) is to let all the bark possible remain on the Vines, and remove it only to destroy the haunts and germs of insects.

A word on painting and dressing the rods. Sulphur, soot, lime, and clay, mixed with tobacco and soft-soap water, is the orthodox mixture for Vine painting. It is not asserted the mixture has no insect-killing power, or that if it is not syringed off the Vines, it may not in some degree act as a red-spider repellent. If these little pests regard it as a danger signal, and turn tail at the sight of it, well and good. I have used it on one half a house of Vines which had carried a nice crop of thrips, and the other half thoroughly washed the rods, giving them an out-and-out brushing with soft-soap water, about 1 lb. to the gallon, and half of the gallon tobacco water, applying it almost hot—that is, at a temperature between 130° and 150°, and the washing altogether beat the mere painting as a means of insect eradication and prevention. Last year (1873) two vineries had some thrips. The Vines of one were painted, of the other washed. Washing proved the most effectual. Painting will not kill the eggs of thrips, but get a spoke-brush, and set to work with a will, and not many eggs will be left on the Vines to hatch. Scrub the woodwork with the same solution, and force it in abundance into every cranny, holding the syringe by a leather-gloved hand to prevent overheating, and you are on the royal road to success in the insect-destroying campaign. Gishurst compound is a fine article for the purpose to those who want something more fashionable than soft soap. To sum up this part of the "dressing," the verdict is, Paint if you will, but wash the rods first. For myself washing suffices.

Shall I add a word about outside border dressings? Should the border be covered to keep out wet? If the soil is not retentive of moisture, and the whole bulk is well drained with an open subsoil, such shelter is not necessary. It may be dressed with manure, and the rain be allowed to wash its virtues in; but if the drainage is imperfect, or the soil guilty of holding water, cover with shutters, or, failing these, dry

material of any kind in sufficient thickness to absorb as much as possible of the rain during the winter months.—J. WRIGHT.

FRENCH NOTES.

EACH succeeding visit that I make to Paris, while it impresses me more and more with its marvellous beauty as a city, also confirms me in the opinion that I have often expressed—that too much has been made of its public gardens, and that they will not bear comparison with those of our own much-abused and smoky metropolis. The clearness of the Paris atmosphere, the bright sun which so often, when we are enveloped in fogs, lightens up everything in the city, and more especially, I think, the long line of boulevards with their avenues of trees, impress the stranger; while the habit that English people have of grumbling at everything in their own country and praising-up everything connected with other nations, tends to make them think that the superiority must rest with their neighbours. But is it so? Let us look, first of all, at the spaces which our public gardens occupy as compared with those in Paris. Look, for example, at our gardens—St. James's, the Green Park, Hyde Park, and the Regent's Park—why, all the public spaces in Paris might be put into one of them, if we except the Bois de Boulogne and the Bois de Vincennes, which are a long way from the centre of population; while if we go farther afield we have Battersea Park, Victoria Park, and Finsbury Park, the two former especially of considerable dimensions. The Champs Elysées, on the other hand, is but a narrow strip; the Tuilleries gardens are small; and the other public spaces, such as the garden around the Tour de St. Jacques, the Square Montholon, are very tiny indeed. Then, if we regard that which, in England at least, is considered the *sine qua non* of park scenery, fine foliage—where in Paris can you equal the grand old Elms of Kensington Gardens, or the foliage of the other parks? We hear a great deal of the Horse Chestnuts of the Tuilleries, and in early spring they are very beautiful; but their beauty is soon gone, and in the height of summer, when our parks are grand in their leafy beauty, these are withered and the gardens littered with their falling leaves. In the Parc de Monceaux, which though very small is the prettiest of those in the interior of Paris, there are some fine trees, but nothing in comparison with ours. But then someone will say, "The Bois, as the Parisians delight to call it—surely that is something we have not." But the Bois is some distance out, it is beyond walking distance; and since the Prussians destroyed part of the wood nearest the city it is even further still. And when you do get there, although prettily laid out, there are no large trees. You have cascades, and lakes, and cafés, and Prie Catalans, &c., but grand umbrageous trees there are not; and in all the French forests that I have seen—St. Germain, Fontainebleau, Chantilly, &c., their beauty is much spoiled by the formal manner in which the roads are made. The straight avenues are very distasteful, and one misses the grandeur of our noble English woods. You cannot but smile when they point out to you some grand monarch of the woods and compare it with your memories of home trees. Nor can it well be otherwise: wood fuel is so great a necessity of France, that the forests must fall beneath the woodcutter's axe, and hence that which constitutes the pride of our woods is absent from them. However, this is a digression, and I must only repeat that, as far as size and tree-beauty are concerned, we are far beyond the French capital in our parks and pleasure grounds.

And now as to flowers. If in the former case we have simply relied on the accidents of circumstances, there can be no question that in the matter of out-of-door planting of tender or half-hardy plants the example has been set us by our French neighbours. It is they who first utilised the Cannas, Caladiums, Ricinus, Wigandias, &c., which have made so wonderful a change in the outdoor planting of our days. But at the same time I must say we have been ready learners; and although Barillet and others did much, I think we may say Gibson and others on our side of the water have done more, while the carpet bedding has assuredly (if that be any merit), been our introduction; and I can with all confidence say that there is nothing now in Paris to be compared with the grand bedding-out of Battersea or the gorgeous displays in our other parks. Indeed, there has seemed to me of late years, save the miserable war which has for a time so paralysed France, a great falling-off in the quality of the bedding-out. Cheaper, and at the same time less effective plants have been used, and the general appearance of the public gardens is, therefore, not so good as under the Empire.

There is one thing which as a lover of flowers I always envy Paris for, and that is her flower markets. When I consider what we can produce, what gorgeous plants our nurserymen rear, and then think of the miserably narrow place which is appropriated to plants in pots in Covent Garden, I confess that I am ashamed of our shortcomings; and the worst of it is that there seems no remedy. I do not know whether the improvements made in the Market will affect flowers as well as fruits and vegetables; but when one walks through the flower market in the Place de la Madeleine or on the Quai, and sees how deftly the Roses, and Pomegranates, and Mignonette, and even the Ox-eye Daisy, are arranged in their white-paper envelopes, and sees the good housewife tripping off with her cherished treasure, I always wish that we had some such way of setting-off the fine plants we can produce.

And passing from flowers to seeds is a natural transition, and so let me say a few words on the very complete and admirably arranged seed-stores of Messrs. Vilmorin & Cie. at Reuilly which they have recently erected for their increasing business. It lacks, indeed, many of those features which in the Messrs. Suttons' establishment at Reading mark their philanthropic views as well as their business habits; but in those niceties of details in which the French are so strong these new stores are remarkable. As an instance of this let me remark that no two varieties of any one vegetable or flower are placed near to one another. Thus, instead of having compartments of various kinds of Carrots, as I have seen them one after another, a compartment is filled with Turnips, the next with Carrots, the next with Cabbage, and so on. These stores are well worth a visit; but let me caution intending visitors to go to Reuilly, not Neuilly, as they are at opposite extremes of Paris.

Seeing as I did the Paris fruit markets at a later period than usual, I was struck with two things—the wonderful abundance of the fruits, and their general inferiority. The Grapes are plentiful and sweet, but then they are not either Muscats or Black Hamburgs. The greater number of the Pears were Duchesse d'Angoulême, quite a second-rate variety, and the Apples lacked the briskness of our own; but the Figs were delicious, and the Strawberries, "fraises de quatre saisons," highly flavoured and abundant; and one wonders why it is we never see Strawberries in October in Covent Garden.

Such are my rambling notes. They may interest some; and at any rate, when the cry is made "They do these things better in France," before it is applied to horticulture I hope I have said enough to show that some doubt may reasonably be expressed on the point.—D., Deal.

OUR ANEMONES.

Of all the flowers natives of our own country as well as imported, none, to my mind, are more interesting than the beautiful Anemones that in many parts of our own land cover acres with their handsome foliage and cheering white flowers, I mean *Anemone nemorosa*; then we have *A. apennina*, the blue species, one that ought to be in all gardens. In the spring no flower can be more beautiful; it appears to thrive in most places. There is also *A. blanda*, of more compact growth but equally beautiful, and coming into bloom earlier than *apennina* (imported). There is, too, that charming gem, *Anemone ranunculoides*, seldom seen except as a variety, which I am afraid it will remain. A shady rockery with a south aspect, moderately moist but thoroughly drained, and attended to with water when required, in a compost of loam, leaf mould, and sandy peat in equal proportion, will be likely to meet its requirements.

I believe the nearer we approach the natural circumstances that plants are found under the greater will be our success in their cultivation. The Double-white Wood Anemone is another of those neglected border plants to which I would direct attention. To see this plant as it may be seen in the early spring at the rectory at Kirk Deighton, near Wetherby, Yorkshire, on the limestone, brought there by Mr. Duncan, the worthy gardener, from Scotland, fifty years ago, is a sight to be had in remembrance.

There is, too, *A. pulsatilla*, far too seldom met with in our borders. It does not increase readily, requires time to get established, and should not often be disturbed; good loam and well-decomposed vegetable matter, with a little coarse sand, full exposure and a moderately moist situation, will suit it. I have never been able to increase it by seed.

I wish to direct attention to those glorious Wind-flowers

that we cannot call our own that so delight us in winter and early spring with their charming colours. They are of easy culture; a moderately dry border or bed will suit them, well prepared by mixing with ordinary garden soil, some good loam, leaf or decayed vegetable matter, a little peat, and coarse sand, with good drainage. The soil should be broken up to the depth of 18 inches some time before planting, so that it may be thoroughly prepared. If they are thus cared for and attended to with water when required they will be likely to succeed. Some people leave them in the ground to take their chance, but I prefer to have them lifted, cleaned, and replanted in the latter months of summer and autumn.

The double varieties of the tuberous kinds may be treated in the same way. They are easily increased by division of the tubers, and by seed. I have known them to be rather troublesome in Box edgings when the seed has been suffered to be carried by the wind to places where it was not wanted.

They are a numerous family widely distributed. The tuberous kinds are well adapted for pot-culture, and may be potted in the autumn, plunged either in a cold pit or sheltered corner, and brought on gradually in early spring. Placed in a cool greenhouse they cannot fail to repay the little labour they have required.—*VERITAS*.

ELECTION OF FRUIT TREES.

ACCORDING to your request I have much pleasure in handing you the names of the Apple, Pear, and Plum trees that have done best with me out of the many planted.

Apples, Dessert.

Ribston Pippin	Noupareil
Cox's Orange Pippin	Thorn Pippin
Shepherd's Fame	Irish Peach
Pursemouth	Shakespeare

Might I suggest that, should there be any difficulty in carrying out the election of fruit trees by countries or districts of countries, it might be carried out by counties? If a gardener in any county would undertake the duty he could easily send a circular to a good number (perhaps twenty or thirty) of his brethren, asking for information with reference to what in their experience they find to be, say, the fifteen best dessert Apples, the fifteen best kitchen Apples, the fifteen best Pears, and the fifteen best Plums. If anyone would kindly undertake this duty and publish the results in your columns, he would confer a favour on many of your readers.—AN AMATEUR, *Fifehire*.

[We shall be obliged by similar returns being sent to us from other parts of all the British islands.—*ENS.*]

MONT D'OR RUNNER BEAN.

Your correspondent, Mr. Luckhurst, seems to be much pleased with Mont d'Or Runner Bean, and I fear his praise is likely to mislead, for after giving it a good trial in 1873, and again in the present year—that is, 1874, I cannot find it at all superior to ordinary French Beans, which when cooked well can be sent to table of a pleasant colour, whereas Mont d'Or, which is a continental variety, and was in the hands of the

London trade a year before it was sent out, is when cooked with the utmost skill only a dirty yellowish green, neither yellow enough to look like marmalade, nor green enough to please the eye.—JOHN BESTER, *Pine Apple Nursery, Maida Vale.*

NOVELTIES IN THE ROYAL GARDENS, KEW.

SENECIO MACROGLOSSUS an interesting and rare novelty, is flowering in the Succulent house. A superficial observer without seeing the inflorescence would at once pronounce it an Ivy, so close is the resemblance, particularly in the form and veining of the leaves. The flower-heads are very ornamental and last a considerable time; they are golden yellow, about 2 inches across, with but a small centre of tubular florets. It is a native of the Cape, and requires greenhouse temperature. Cuttings are easily rooted. The cultivation is very simple, so that no special instructions are necessary. The above is an example of plant-mimicry—when two species not related so closely resemble each other that they might be mistaken for the same. Even the scrutiny of the botanical eye has been deceived; a specimen without flower was described for a genus to which it has not the slightest relationship. Several suggestions have been advanced for its scientific explanation, but nothing clear and decisive has yet been given. Without diving into detail we cannot perhaps do better than quote a sentence in the "Popular Science Review," written by Mr. A. W. Bennett. He has recourse to the "doctrine of design," and says that "Nature has some general purpose in the different modes in which life is manifested; a purpose not in all cases for the immediate advantage of the individual species, but in furtherance of some design of general harmony, which it may take centuries of unwearying observation and laborious toil before we discover the key by which we may be able to unlock it."

Asparagus decumbens, a species of pretty slender growth, is here in flower. The stems are numerous, and, mingling together, form a mass of lively green. The flowers are small, but sprinkled numerous and with pleasing effect over the entire plant. They have cinnabar red anthers, contrasting with the white perianth. The perfume is agreeable, and not unlike the lemon-scented *Verbena*. It may be increased either by seeds or division, and is worth cultivation wherever variety is desired. Rich loamy soil should be used. Here may be noted a point of interest: The leaves of *Asparagus* and other genera of the tribe *Myrsiphyllum*, *Ruscus*, &c., are always developed in the form of a minute membranous scale. In their axils are one or more branches, which perform the function of true leaves, and have more or less their appearance. For true leaves they are usually mistaken, and for them are often described.

If a digression from our heading can be allowed, it is impossible not to mention *Luculia gratissima*, which is magnificently in flower in the conservatory. It is planted out in a bed of *Camellias*, and in a similar position it should always be cultivated. In pots it may be grown, but with less success and greater trouble. We have before given methods of cultivation, to which our readers can easily refer. It cannot be too persistently recommended to the attention of all who do not make it of great value during winter.

SALTPETRE FOR HYACINTHS.

Now that the time has arrived when lovers of Hyacinths in glasses will have, or ought to have, them consigned to their places of flowering, it may be interesting to know that while the bulb is producing its roots in the water, by applying a little of nitrate of potash (saltpetre) to the water in which the bulb is in, it will in a great measure stimulate growth, and be the means of producing better roots and flower than otherwise would be. Dissolve the nitrate in water, pour it into the glasses when changing the water, which ought to be done at least every two or three weeks. If there are any who doubt this fact, let them apply it to some such thing as Mustard or Cress, which they are likely to be growing in their hothouses about this time, when, I doubt not, they will find it to produce beneficial effects, and I shall be glad to hear of such at some future date. But although all means are taken to produce growth there will be many failures, which will arise from not having the proper bulbs for water. As a rule, single Hyacinths grow much better in water than the double varieties. The water ought to be soft, and when changed not colder than the temperature of the room or the place where the Hyacinths

are kept. Many are the failures I have seen, owing to some ladies thinking if they just had a bulb struck in a glass with the water nearly over the bulb, it was all right.—WILLIAM LAURIE, *Lynnwood.*

COLLETIA CRUCIATA.

A SHORT time ago it was noticed that this shrub had flowered somewhere under glass, and was a highly ornamental object; but is it necessary to keep this plant under glass at all? One we have here (Linton Park, Kent), has flowered for several seasons quite exposed, there being nothing higher than itself for several yards in all directions, and during the autumn it was

Fig. 157.—*Colletia cruciata*.

a mass of flower, and I need hardly say looked exceedingly well from the middle or early part of October up to the 11th of November, when we had a sharp frost, which injured it very much, or rather disfigured the flower to a certain extent, but not entirely so; and notwithstanding the wind, rain, and frost we have had up to the time I write (December 8th), there is still a good sprinkling of flowers on it.

It is certainly strange that this plant should be so prolific in flowers, and the equally formidable, but not so curious, *C. horrida* should flower so sparingly, as I have not noticed a single bloom this season. Both plants being about of a size, and equally open to all the influence of the atmosphere. And to those who have not grown *C. cruciata* I would by all means recommend it to their notice, as its singular formation renders it a highly interesting object every day in the year. Its rigid cruciform construction, armed as it is with spines equally formidable, give it a Cactus-like look, and proclaim its foreign habitat. Yet even there I should think it has more the stamp of a spreading than an upright tree, as the plant we have, which now and then makes a vigorous growth in some of its parts, has a tendency to lie down or spread, rather than push

upwards. It is also with me a deciduous tree, although often classed as an evergreen; but to the general observer it makes no difference, for nine out of every ten who pass it would not notice any foliage upon it, even in the growing season, the foliage is so small and insignificant, and all but lost when seen in contrast with the sturdy flattened stems, which, meeting each other at right angles with rigid accuracy, form the structural features of the plant, and give it importance and interest in all who admire singular-looking plants. Where a collection of trees and shrubs is made, this ought never to be omitted, provided the situation be at all a dry one; for I hardly expect it to prosper in one of a contrary description.

It is only fair to say that extraordinary hard frosts may kill or at least injure it. One we had, and which had attained some size before the hard winter of 1866-67, succumbed to the severity of the frost that season, but the present one has stood unprotected ever since that time, and in the past season was entirely covered with its white blossoms, which look equally well either in a bud or expanded state. I believe it originally appeared as *Colletia bictoniensis*, but has latterly been more properly called *C. cruciata*, and hails from that country so prolific in formidable-armed plants, Mexico; and presuming its growth to be in accordance with what may be expected of it in its native country, it must make a fence impenetrable either to the human race or wild animals. Its contemporary *C. horrida* is also a touch-me-not plant, but lacks that peculiarity of structure which gives *C. cruciata* a feature differing widely from everything else I know of growing outdoors, and equalling in many respects the singular formation of many of the succulent plants which inhabit our houses, which I expect at some future time not far distant may again become fashionable.—J. ROBINSON.

REPLANTING WOODLAND.

In 1859-60 an enclosure, which had been recently cleared of Larch trees (except a few of the finest and best-grown, which were left, and are now standing), was replanted with Larch. These grew vigorously up to 1868, the very dry year, when many of them showed symptoms of a check. The year following there was a slight improvement in the growth, but since and up to the present at least one-third of the trees have made little or no growth, and comparatively few have made a fair and healthy progress. During the period a good many Sycamore, Ash, and some Oak have come up spontaneously, and are healthy-growing trees. The land is of better than average quality, and would not have been originally planted with trees but for a special object. The Larch which were fallen on it in 1858 were generally well-grown healthy trees, some reaching to from 40 to 50 feet cube. The following appeared in a contemporary a few years ago:—"I never knew a single instance where a new plantation was made on ground that had been previously occupied with trees that ever succeeded unless the whole of the ground was trenched over as deeply as the roots of the trees removed had gone, and every root as thick as a person's finger got out. . . . The result is generally this: The young trees for a time grow, but in two or three years they begin to look sickly, and die off. On examining the roots they are found to be destroyed by a fungus, which has done Nature's work in assisting the decomposition of the dead roots, and, for want of a further supply of food, attacks the living ones, which, in turn, succumb to its encroachments.—T. BAINES."

It will be observed that in the present case the trees had been planted eight years before any unhealthy symptoms appeared. I should state that the ground was not trenched, and the growth of the trees was much more rapid in proportion after the first three years than before, owing to the strong vegetable undergrowth they had to contend with at first. The stools and large roots of Larch of the age and size of those fallen would, however, be much longer than three years in decaying. I should have considered the observation of Mr. Baines almost conclusive as to the cause of the second crop of Larch failing if I had not had some considerable experience with regard to growing timber, especially Fir plantations.

If the decaying roots of trees removed were so prejudicial as would seem from his opinion, the periodical thinning of all well-managed plantations would tell injuriously upon the trees left standing, the roots of the removed trees being always left behind; this, however, is not the case, but on the contrary I have found nothing more beneficial to the growth of plantations than judicious and periodical thinning, and this is not confined to very young trees. I am aware, as a rule, it is not

desirable to crop land twice in succession with the same crop; but in the present instance I was induced to replant with Larch, as the most useful and speedily-profitable timber. I may mention that the few Larch left standing have been gradually showing symptoms of decline since the others were fallen, but I attribute this to being subjected to exposure they had not previously been habituated to. Perhaps the observation and experience of some of your readers may throw light upon the subject.—V.

ROSES SELECTED.

I HAVE received a letter from a lady in Ireland ("M. H. B."), who complains of scant information as regards Roses in THE JOURNAL OF HORTICULTURE, but she is certainly wrong about the "Election of Roses." If she will order the number published Oct. 1st she will see there the opinions of amateurs as regards the best fifty Roses, including the best twenty Roses. She wishes to know my opinion of the best Roses of the last two years. I buy "infants" very rarely, as my gardens are so exposed to violent winds. In the late gale 109 feet of a new brick wall (south aspect) was blown down and squashed eighteen of my best Peach and Nectarine trees.

I will name a selection of Roses, beginning with those of 1864, which I find to be good, of good growth, and of good constitution.

1864.—Achille Gouod, Dr. Andry, Duchesse de Caylus, Marguerite de St. Amand. 1865.—Abel Grand, Alfred Colomb, Fisher Holmes, Mlle. Marie Raby, Prince de Porcia. 1866.—Black Prince, Felix Genero, Annie Wood, Princessa Mary of Cambridge, Madame Margottin, Tea Rose. 1867.—Elie Morel, Baroness Rothschild. 1868.—Duke of Edinburgh, Madame Creyton, Thyra Hammerick, Edward Morren.

I do not know the exact dates of the following, but I can safely recommend them—namely, Baron Chaurand, Maxime de la Rocheterie, Countess of Oxford, Etienne Levet, Claude Levet, Vicomtesse de Vezins, and Mr. Veitch's beautiful and valuable high-coloured Tea Rose the Duchess of Edinburgh. The Rose is A1, and the growth excellent. I have other novelties, but the plants are as yet weak, and the summer was very trying for infants. Next season I hope to be able to speak favourably of Van Moltke, Diana, Peach Blossom, and St. George.

Preceding 1864 (in 1863) there came out three Roses which it is impossible to praise too much—Pierre Netting, Madame Victor Verdier, and Leopold Premier. I thank the lady for her confidence in my recommendations. I never recommend bad growers or reluctant bloomers, and I do not like judging "infants" hastily.—W. F. RADCLIFFE.

TILLANDSIA LINDENII.

In several cuts of the above-named plant that I have seen it has always been represented as throwing up only one spike of flower at a time—viz., from the heart of the plant. I have a plant under my charge which has produced three spikes, one from the centre and two from the axils of the leaves. Is this unusual? The glowing descriptions invariably given of this charming plant when exhibited, and the flowers being of a colour (blue) so much wanting in exotica, makes me anxious to become more intimately acquainted with this floral beauty. The centre spike has a very strong spathe promising to open at least fourteen flowers; the other two are not sufficiently advanced for me to determine their number, but all are very healthy-looking. I shall be exceedingly glad if any of the readers of the Journal can enlighten me.—W. C.

SOILS AND SUBSOILS.—The soils upon which the agriculturist has to operate are usually classified as sandy, sandy or light loams, loams, clayey loams, heavy or retentive clays, marls, calcareous loams, peaty soils, or bog earths. This classification has reference chiefly to composition and texture, a special chemical composition (silicious, calcareous, &c.), being necessary for the profitable growth of particular crops, and a certain mechanical texture (friable, porous, &c.), suiting best for the permeation of rain and air, and the descent or spreading of special roots and rootlets. Loams, consisting of fertile admixtures of sand, clay, and humus or decayed vegetable matter may be regarded as typical soils, which become, on the one hand, light by a preponderance of sand, and on the other, heavy by a preponderance of clay. But whatever their composition and texture, these soils, geologically speaking, are mainly of

two sorts—soils of disintegration, arising from the waste and decay of the immediately underlying rocks, together with a certain admixture of vegetable and animal *débris*; and soils of transport, whose ingredients have been brought from a distance, and have no geological connection with the rocks on which they rest.

Under the former are comprehended such as arise from the disintegration of limestones, chalks, traps, granites, and the like, and which are directly influenced in their composition, texture, and drainage by the nature of the subjacent rocks from which they are derived. Under the latter are embraced all drift and alluvial materials, such as sand, shingly *débris*, miscellaneous silt and clay, which have been worn from other rocks by meteoric agencies, and transported to their existing positions by winds, waters, or ancient glacial agencies. Besides these there are also soils of organic origin, such as peat earths and vegetable mould or humus, which is to a great extent also of animal origin or elaboration. Indeed, in all superficial soils there is a certain amount of vegetable and animal matter—the decay of plants, the droppings of animals, the exuvie of insects, the casts of the earth worm, and the like, conferring upon them that dark, friable, and loamy character so indicative of richness and fertility.—(*Page's Geology in its Relations to the Arts and Manufactures.*)

A FLOWER MISSION.

FIVE or six years ago a young girl, at that time a teacher, noticed in her daily rambles the great waste of fruit, and especially of flowers, in the gardens of the wealthy. Myriads of blossoms that might gladden sad hearts and tired eyes are allowed to fade through the long summer days, sometimes because their owners are absent abroad; oftener still because of the superabundance resulting from liberal culture. Each week our thoughtful girl came into the great city, always bringing with her a basket or a bouquet of fresh flowers, sure, even on her way from the station to her home, to be asked for flowers by a score or more of little children, ragged, yet with the love of the beautiful in their hearts.

The summer passed away, but not the happy thought born of the summer. In the city are vast numbers of poor suffering souls, not alone in hospitals and on sick beds in narrow straitened homes, but hundreds of sewing girls spending their lives in hot stifling work-rooms in the heavy woollen manufactures for fall and winter trade. Where is their summer? What do they know of Nature's gracious bounty in field and wood, on hill and glade? On the one hand the need, on the other the demand and its possible fulfilment. Not only in the fields and woods ready for the harvest, but also in the conservatories and greenhouses, and gaily blooming flower beds of the suburban gardens environing the great metropolis, are countless superfluous blossoms that were not "born to blush unseen," and should not "waste their sweetness on the desert air."

The first Sunday in May, 1869, in several of the city churches a brief notice was read, inviting all having either fruit or flowers to spare, or time to gather wild ones from the woods, to send their gifts to the chapel of Hollis Street Church, which would be open on Monday and Thursday mornings from eight till twelve for the reception and distribution of flowers and fruit to the sick and poor in the city. Any and all who might have leisure and inclination to assist in tying-up bouquets, or in carrying them to their destination, were invited to meet at the chapel on that Monday morning; a curious example of an organisation almost self-created; entirely composed of volunteers; no membership or qualification for membership other than the desire to lend a helping hand; no president, no official red tape; each did that which seemed right and fitting, and in keeping with the beauty and fragrance which, week after week through the long summer, made the old chapel blossom like the Rose. We quote a few words from an account of the first day's experiment: "The first to come were two girls, who, glowing with the air of their country homes, and excitement from the thought of the pleasure they had the means of giving, appeared with baskets filled with *Houstonias*, *Cowslips*, *Violets*, and *Anemones*, nicely tied up in pretty bunches; then two more with basketsful of *Violets*, and again another with field flowers. So far all were personal friends; the next contribution, however, was from a stranger—hothouse flowers and ripe red *Strawberries*. Again, a silver-wedding gift of twelve beautiful bouquets, seeming to the donors the pleasantest memorial they could convey of their own happiness. Again, a Lady Bountiful sent her carriage laden with cut

flowers, pot plants, and branches of flowering shrubs, placing her carriage also at the service of the members—a welcome gift indeed, for it is no light task to carry the large, flat, flower-laden baskets to their destination." This was a good beginning for such a quiet, unostentatious charity: contributions from thirteen sources; distributions to 150 persons.

The work begun under such favourable auspices never flagged throughout the summer. The givers were liberal; the workers also. School children in the surrounding towns made excursions to woods and fields, and sent in generous collections of wild flowers, Mosses, and graceful Ferns. Regular contributions were also sent from private conservatories, sometimes carefully and tastefully arranged in little bouquets ready for distribution, sometimes in huge bunches of individual flowers, easily separated; sometimes a large basket held many varieties of flowers in layers, with moist cotton between; the flowers having been sorted in the gathering, the Pinks, the Roses, the *Heliotropes*, &c., which rendered the work at the chapel much simpler, and lessened greatly the risk of breaking the stems, always to be feared in separating indiscriminate masses. The essentials for work in the chapels were a long table, broad enough to turn the flowers out in heaps, with room for assorting; shallow tanks of water in which to place the bouquets as fast as prepared until the hour of distribution; plenty of string, and scissors and chairs. It is unwise to attempt to work standing; the fatigue is great, and should be lessened as much as possible. Large flat baskets, like market baskets, are the most convenient for carrying the flowers without injury. It seemed as though everyone had been waiting for just this chance; for not alone were the flowers provided, and busy, willing hands to arrange and distribute them, but corporations (supposed to be soul-less) became liberal and generous to an unwonted degree. Railroads transported free of expense the baskets and parcels for the Flower Mission, not only over the roads, but always finding among the *employés* at the stations someone to carry them to the chapel. If the baskets were marked with the owner's name and residence they were returned also by the next train free of charge. Many a basket twice a-week made its journey to and fro in this way from Dedham, Newton, Wellesley, Hingham, Lexington, and even as far as Plymouth. From Quincy twice a-week came two or three huge wash-tubs full of garden flowers and wild flowers. In the gathering everyone united—catholic and protestant, orthodox and unitarian, all for the love of God and His children.

We copy a few statistics from the report of the ladies connected with the Flower Mission at the close of the first season in October, 1869:—

Contributions in flowers	356	Number of towns sending contributions	26
" in plants	39	Number of bouquets distributed	6,718
" in fruit	30		
Number of contributors	106		

Of these 1132 were sent to people confined to the city during the warm weather. The plants were scattered among various homes. The remainder of the flowers were taken to the hospitals and asylums, and sometimes to the gaol and State prison.

In the spring of 1870 the ladies of Cambridge proposed to co-operate with the Hollis Street Chapel by establishing a branch mission for the distribution of surplus fruits and flowers in their vicinity. In 1871 Chelsea followed suit. Thus the country was brought to the city—close to thousands who are never permitted to "go a-Maying," or to look upon the full glory of summer time.

During the second year of the mission the contributions, and consequently the distributions, were more than doubled. Over 11,000 bouquets were distributed, besides 1800 Pond Lilies, chiefly from one friend. These last wrought a "special work of grace" among the denizens of the North End, to quote the words of the resident missionary in that apparently godless region. There were men, and women too, whose hearts seemed like nether millstones, impervious to all good influences, baffling every attempt at sympathy or enlightenment, to whom the sight and smell of the Water Lilies brought tender memories of childhood perhaps, when, young and innocent, they too had gathered the pure white blossoms. The Lily brought to them its message of beauty, grace, and sweetness, rising above the waters, reaching heavenward even from the black oozy depths below. Who shall say that some human heart to-day is not purer for the silent lesson of those Water Lilies? Beauty, the gift of the All-Beautiful as well as the All-Bountiful, is an evangel for ever to human hearts. Surely they need it most whose lives are rendered the most unlovely

by sin and misery. It would be pleasant to give the name and the portrait of the Pansy Man; but the modesty and reticence which so long kept him unknown, save by the sobriquet earned by his lavish gifts, forbid. Literally by thousands were they brought, royal in purple and gold, and every rich strange tint born of hybrid culture. About twenty hospitals and infirmaries were supplied week by week; and many touching incidents might be related in connection with them. It was odd to see the various preferences shown in the hospitals. The men would oftentimes choose bunches of fragrant border lilies; the women almost always wanted roses; if country-bred, wild flowers were the most eagerly sought; in the work-rooms, garden roses, sprigs of trailing Arbutus, sweet Honeysuckle, or boughs of pink-tinted Apple blossoms.

As the weeks wore away, and a kind of intimacy grew up between givers and receivers, special cases were remembered in the making of the little bouquets: to the blind girl always as many fragrant flowers as possible; the consumptive in the clean white hospital bed welcomed the scarlet Geranium, which lent a bit of warm bright colour to the prevailing white of the wards; one young sewing girl always begged for Lilies of the Valley—it seemed easier, she said, to sew the long white seam with the delicate white flowers keeping her company.

The report of the physicians connected with the hospitals is most encouraging. They say it is a great aid to convalescence when the patients have something to divert their thoughts from their own suffering, and nothing answers that purpose so well as the fresh beauty and fragrance of flowers. In Chelsea many of the physicians send in list of special cases in their practice where such gifts would be particularly beneficial: oftentimes, they say, the fruit sent is the best of agents in hastening recovery.

Among the pleasant records of the mission are the visits to the Bennett Street Dispensary, where many poor sick people go for advice and medicines—often two hundred patients in the course of the day, each waiting their turn, and weary waiting it is. The surprise and delight manifested when the flowers are distributed among them must be seen to be appreciated. Many touching letters have been received from hospital patients and from the workrooms. A brief extract from one of the latter is given:—"I think our Heavenly Father must have put it into some sympathising Christian heart to thus remember the toiling ones—we who are shut up from morning till night, and see but little of Nature's beauties. I, for one, very deeply appreciate the gift of flowers. As I looked at them I thought, 'What is the message they have brought me?' Something within me seemed to say, 'To comfort you, to whisper hope, whenever your faith grows dim!' Christ must have loved flowers, for He gave a lesson to His disciples, 'Consider the Lilies.' I have been considering them all the afternoon. These flowers shall fade, but the Great Master speaketh to me and saith, 'Go, say kind words, and do kind deeds to your fellow men, and cause beautiful flowers and love and trust in God's goodness to grow up and blossom in their dreary pathway, and remember that whatsoever ye do unto the least of these My brethren, ye do it unto Me.' . . . I thank the Mission for the flowers. They did me a world of good, turning my thoughts from the daily drudgery of life to something nobler and better. With the gratitude of a weary toiling sister."

One thing of special note in connection with this Flower Mission is that none having put their hand to the plough seem to look back or loose their hold. Sooner or later we trust every town and city, every country village, will have its Flower Mission.—(*Harper's New Monthly.*)

GARDEN LABELS.

I AM sorry not to observe among the many suggestions in the Journal respecting garden labels any reference to the imperishable labels brought out by Mr. Bell, formerly of Stratford-on-Avon, and now of Pevensey Road, Eastbourne. I used to paint slips of wood, and mark them before the paint was dry with a lead pencil, as one of your correspondents recommends; but I found in course of time that the lead mark disappeared, or became almost illegible. Looking for something less disappointing, I lighted upon these labels, which I have now tried for some years, and can certainly recommend to others. They are made of a white lustrous metal, which seems well suited to withstand the action of the weather, and is unaffected by cold or heat. The names of the trees, &c., to which the labels are attached are in black-faced letters raised from the surface, and

are thus rendered more distinct than they would otherwise be. No doubt the wooden labels painted and marked with a pencil are the most useful for temporary purposes, but for a permanency for trees, shrubs, roses, and such like, I prefer Mr. Bell's. I notice that the inventor states that his labels have been supplied for the Royal Avenue of Wellingtonias in Windsor Park.—E. BARTRUM, *Berkhamstead, Herts.*

THE D'ARCY SPICE APPLE.

I wish to draw attention to this, probably the very best of all dessert Apples, and I think one of the least known.

The D'Arcy Spice is a local Apple, raised some years ago at Copford, near here (Colchester) by a Mr. Cobb, a farmer, or something of that kind, and it was distributed by him to his friends. Some being taken to Tolleshunt D'Arcy, they were found to succeed so well on that soil, and so many being grown thereabout, it became locally celebrated as the "D'Arcy Spice." This, then, is the history as I was told by a son or grandson, I forget which, of the Mr. Cobb above-mentioned.

Unfortunately this Apple was not brought out by a nurseryman; if it had been there would have been a chance for its excellencies being better known. So little has it been distributed that I cannot call to mind any tree further than twenty miles from the place of its first growth, and there and in the immediate neighbourhood every garden has its "Spice;" but I must except those trees, and there are many, that have been sent by officers of this garrison to their friends.

There is an Apple (Baddow Pippin) somewhat like it in Dr. Hogg's "Manual," but the description does not quite agree; and should your questioner feel disposed to make a trial of D'Arcy Spice, I would recommend him to plant as many trees as he has space for, especially if he has heavy soil, and I am sure he will never regret it when he tastes the first Apples that ripen; which, by the way, they never do until November. At the same time I may inform him a letter addressed to Mr. Cant, the well-known Rose-grower, will put him in the way of getting a supply of any quantity of young trees.—HENRY LAYER.

[We have no doubt that the D'Arcy Spice Apple is identical with the Baddow Pippin of the "Fruit Manual," notwithstanding the slight difference of the short description given in the third edition of that work, a difference which in all probability is so slight as to be attributable to soil or situation. In the forthcoming edition of the "Manual" a lengthened and more minute description is given. This Apple may be obtained from any large fruit-tree nurseryman.—Eps.]

NEW BOOK.

Domestic Floriculture, Window Gardening, and Floral Decorations. By F. W. BURRIDGE. W. Blackwood & Sons. With two hundred illustrations.

Four of those illustrations the courtesy of the publishers enables us to place before our readers, and we do so the more readily because this is the season when our clerical and lady friends are especially attending to the work those illustrations facilitate.

"The introduction of beautiful natural objects into our places of public worship is not done merely to satisfy the eye with

pleasing forms and glowing colours, since any kind of artificial ornaments, provided they are graceful, would do this almost as well as natural flowers. They are introduced, or ought to be used, as appropriate incentives to kindly thoughts and pure religious feelings; hence we should avoid the employment of paltry effects in stained Immortelles or gaudy paper flowers, as being in bad keeping with the object we desire to attain. If we bear the object of church decorations in mind, and endeavour to

or branch, so that by tying in this way every branchlet is looped round twice, and thus firmly secured in its place. Clusters of white Immortelles or scarlet berries alternately are very effective in wreaths of dark green foliage. The twine used for tying should be cut into lengths 6 feet long, and should be looped round the stems without cutting. Longer lengths than this will be awkward to draw through the noose. Green and variegated Ivies, Hollies, and Enonymus, make nice wreaths, as also do

Figs. 158 and 159.—CHURCH DECORATIONS.

attain that object, there will be but little fear of inharmonious combinations, or the introduction of anything likely to offend the good taste of anyone present. All laboured attempts at religious decoration are superfluous, and often spoil the effect one has in view. We use flowers and fruits to give an idea of God's bounty and providential goodness; and the more simple our arrangements are, the more likely is this end to be attained. Simplicity and graceful beauty or elegance are more often synonymous than is generally supposed, and this is especially the

sprays of Portugal Laurel, Aucuba, Juniper, Thuja, Yew, Tamarisk, and Box. Light and graceful wreaths look well twined spirally, round columns, or carried round the tracery of Gothic arches, or the mullions of large windows. For the altar-cloth nothing looks better than a simple cross of silvery Immortelles and Grasses. This should be large enough to stand out clear and bright; but the size will be regulated by the dimensions of the cloth itself. We have tried many devices for the altar-cloth and pulpit; but nothing is better than a bold cross or the mo-

Fig. 160.

Fig. 161.

case with regard to floral decorations for churches. Wreaths of Ivy and other evergreens are very useful in Christmas decorations, and are easily made on thick twine or cord. Small sprays or little branchlets are preferable to single leaves, as they go further, and are not so stiff and formal as those made with leaves stripped from the stems. To make a wreath, take a branch or spray of foliage, and commence at one end of your cord. Lay the branch along the cord pointing towards the end from which you start, and just loop it round with a bit of thin twine. Now add another spray and loop it in the same way. This last loop should also just catch the base of the first spray

nogram IHS either in white Immortelles or scarlet berries. Texts tastefully formed in foliage and berries look well on scrolls or shields; while neat wooden shapes may be used for initials, monograms, and pleasing geometrical designs, such as crosses of various shapes, circles, or stars. Any carpenter or model-maker will make them in a few hours (see *figs. 158-161*). Some make these designs by glueing leaves and berries on pasteboard shapes. If the cloth is crimson or dark blue the Everlastings stand out clear and bright, and are then very effective. The flowers used in Easter or harvest decorations should be of graceful form, bright or distinct colours, and should be arranged so that the

Individual beauty of each blossom is seen in addition to the general effect. All kinds of Lilies are very suitable, especially *Lilium speciosum* and its varieties. The foliage and flowers of the chaste Trumpet Lily (*Richardia æthiopica*) are unsurpassed for the altar, and last a considerable time after being cut from the plant. A good specimen of this plant, or two or three small ones placed together, look remarkably well arranged on the font, especially if the latter is in a prominent position. Both flowers and foliage are of classic simplicity, and look remarkably well along with stately or architectural details. For harvest thanksgivings a small sheaf of Wheat or Oats looks well and very suggestive laid on the altar table; while tasteful groups of Corn, Lilies, bright-coloured autumn leaves, and fresh green Fern fronds look well on the pulpit or reading-desk. If the pulpit, font, and pillars are of white stone, they look well draped with the Virginian Creeper and Ivy, both of which should be allowed to droop unrestrained in elegant festoons of bright glowing crimson and green; while clusters of Apples, bouquets of Wheat and Oats, or bunches of Grapes, may be introduced here and there with good effect. The silvery or pale rosy plumes of the Pampas Grass (*Glycerium argenteum*), and Arundo conspicua, mixed with branches of the Purple Beech, or the feathery foliage of the Sumach, when tinged with crimson in autumn, are very effective; and stems of Arundo donax or Japanese Maize may also be used for variety. All these are bold and distinct, and look well massed in a picturesque manner along with the glowing scarlet flowers of the Scarborough Lily (*Vallota*), the Guernsey Lily (*Nerine sarniensis*), or the delicate pink flowers of the Belladonna (*Amaryllis*). Group all your foliage and flowers as naturally as possible, and do not attempt anything in the way of unmeaning designs. Ladies, as a rule, do these kinds of ornamentation better than anyone else, and seldom fail to make pleasing arrangements. It is as well to be careful in the use of yellow flowers, as many of these have a glaring or gaudy appearance, not in keeping with the quiet richness of colouring and peaceful harmony of arrangement which should at all times prevail within a sacred edifice."

Let it not be supposed that our extract is from the most valuable portion of the volume, for we recommend it to our readers as a sound, practical guide on all the subjects mentioned in its title-page, and the illustrations are all aids to amateurs not deeply versed in the culture and use of flowers.

ANTS AND IXORAS.

IN the plant stove here we have a great quantity of ants, and not one is to be seen in any other part of the garden. We have searched in vain to find their haunt that we might destroy them, and have tried every remedy we know in the stove, but cannot get clear of them. One of our specimen *Ixoras*, I. Colei, has been severely attacked by the ants completely barking one branch, which, of course, died, and it was quickly perceived if something was not done the whole plant would be lost. The ants had succeeded in making their haunt in the earth of the pot, consequently the plant was taken out of the pot, the ball reduced and repotted again, and plunged in bottom heat, and will I think with care recover. The roots were nearly all destroyed and eaten by the ants. What would be the most effectual remedy?—S. J. A.

NOTES AND GLEANINGS.

THE *English Mechanic* says that any variety of posts can be rendered nearly indestructible by boring one or more holes, larger or smaller, in the centre of the butt, the whole length if desirable; then fill with boiling coal tar and close the aperture with a long taper wedge well driven home, which will give coal-tar pressure to force the antiseptic into the inner heart pores of the mould, where the dormant seeds of decay will be at once destroyed.

— We have been asked to tell our estimate of the Christmas number issued by the *Pictorial World*, and we cordially respond that we think it one of the best and cheapest sixpenny-worths we ever have seen. The pictures, "Family Diamonds" and "Noah receiving the Dove," are worth the money.

LATIMERS,

THE SEAT OF LORD CHESHAM.

THE gentle hills and dales of the eastern border of Buckinghamshire give to the district that pleasing appearance which more bold features often fail to do. Most people admire a piece of water, or a healthy fine-growing plantation all the more, because by its side fields of waving corn or promising green crops adjoin it instead of rock and waste. Such is the

district I am now about describing. Excellent roads and hedges traversing a country that in but a very few instances indeed presents hills too steep for the plough, while but a very small portion of it can be called level. Chalk and gravel being the general subsoil, the latter in some places being too plentiful perhaps for healthy cultivation; but on the whole the district may be considered a very fertile one. It may be regarded as a purely agricultural district, tolerably well, however, dotted over with the mansions of those well-to-do in the world.

The traveller on alighting at Watford from the North-Western Railway will find another train to take him to Rickmansworth without his being able to notice anything remarkable on his journey, excepting in the distance on both sides trees in more than ordinary abundance, indicating that some nobleman's or gentleman's mansion may be enclosed from view; but as we approach Rickmansworth a lesson may be learned, which may very likely be copied with advantage in some other county, of the mode that Watercresses are cultivated. The stream of water being divided and widened is made to flow over a wide assemblage of beds, separated from each other by elevated terraces of grass land.

Alighting at the terminus of the short branch to Rickmansworth, we take the road leading from thence to Chesham, and in travelling along meet with the features noted above. Noticing at the same time that most of the dwellings we pass are either timber or brick-built, the modern ones of the latter material, while those claiming an existence in the sixteenth and seventeenth centuries were of the timber-framed class, which give such picturesque appearance to so many parts of the centre of England; but many of these show the effects of modern innovation, the overhanging upper storey has often disappeared, and the ancient ornamental plastering has become obliterated by repeated coats of whitewash. We pull up at mine host's of the Bedford Arms, and by his direction make a little detour of the village, which we are informed claims to be the original home of the noble family of Russell, and having a little time on hand are introduced to the church, which contains the memorials of so many members of that ducal house, and cannot but admire the beautiful keeping and quiet repose which pervades the whole, as well as the good taste which has not overladen such a sanctuary with undue embellishment to the exclusion of becoming thought which such a place is likely to call forth; the fine situation of the church is also to be admired. Proceeding onward, and descending the somewhat steep hill on which Chenies stands, we find ourselves skirting a stream of water that flows down the valley, and pursuing this some time we cross it, and find ourselves confronted with one of the entrances to the place we set out to visit, and omitting the principal entrance we pursue our journey until our guide brings us into near proximity of the gardens, and at no great distance from the mansion itself.

Latimers derives its name from the family to whom the manor and its surroundings were given by Edward III. From them it passed by either marriage or sale to the Nevilles, Grevilles, Sandys, and Cavendishes, one of the last-named being its present proprietor.

The mansion is on the side of an eminence facing a valley through which the river Chess flows. The bank on the opposite side, as well as the park, as seen to the right and left, is well wooded. Perhaps some would say too much so; but trees are always an agreeable object, and when it is taken into consideration how few are planted now-a-days compared with what are cut down, it is always pleasing on domains to see venerable as well as healthy fine-looking trees abound. Another feature at Latimers not less valuable, as adding to the features of the place, is the presence of a fine sheet of water in the valley alluded to. The widening, I presume the damming-up, of the river Chess, which has been skilfully done, accomplishes this; and it is also at a convenient distance from the mansion and dressed grounds, which, as has been already described, occupy a suitable position on the side of the rising ground. A series of terraces on the south side, on one of which a neatly-arranged flower garden was a blaze of beauty, is separated by a neat iron fence from the park on that side, while a panel of considerable size on the west side of the mansion was laid out as a geometric garden, with Box edgings and gravel walks, containing the choicest hedging plants; while a sloping bank which formed its northern boundary, and was something higher than the panel forming the main set of beds, was planted with foliage plants, as *Alternantheras*, *Golden Feather*, *Echeverias*, and similar things, so as to form a very pleasing feature, and formed an excellent frame to the

picture on that side, a balustrade forming its boundary on the western side; but both beyond that and also on the east side the pleasure grounds extend some distance, embracing some choice shrubs and Conifers, while the abundance of fine Oaks, by which shelter is given to everything, give the whole the clothed appearance which is so essential a feature in all dwellings having any claim to importance. The principal approach to the mansion is on the east side. The offices, which are very capacious, are on the north side. The mansion itself is also large; a dressed brick of a pale colour, with stone dressing, is what it is built with, and its quiet unimposing tone harmonises well with the surrounding mass of foliage by which it is enclosed, forming, as a whole, a noble residence, wherein internal comfort has not been sacrificed to outward display.

The kitchen garden and forcing houses are handy to the mansion; a walled-in space of considerable extent, with the usual slips and other outside appendages, are all conveniently placed for utility. The general contour of the ground sloping gently to the east, and the walls being plentiful, are duly made use of in the growth of the finer fruits, while the glass structures are all fully occupied. One house especially, detached from the rest, struck us as being remarkable; it was a span-roofed vinery, small in every sense excepting in the size and number of bunches of Grapes growing in it, and in this respect it was certainly most remarkable, and was justly regarded so by many good judges that happened to be there at the same time, some estimating the total weight of fruit to approach 600 lbs., and that in a house apparently not more than 40 feet long by 12 feet wide; but I speak more by guess

FIG. 192.—HATFIELD.

after leaving the place than by judgment on the spot, yet I never saw a finer lot of Grapes in a small house anywhere. Many of the bunches would weigh 4 and 5 lbs., which is heavy enough for any purpose, and I don't think there was one bunch under 2 lbs. in the house; and the house being low, the whole, or nearly so, were within reach from the central pathway running along the middle of the house underneath the ridge. The kinds grown were Burkhardt's Prince, widely distinct from the ordinary Black Prince; Royal Ascot, very good, better than I have ever seen this variety, which does not seem a favourite amongst Grape-growers; Madrestfield Court, and Alicante, both in excellent form, as was Mrs. Pince's Muscat, which was certainly better than the Barbarossa, although the crop on the latter belied the usual character given it of being a shy bearer, while here it was all that could be desired. The all-important Lady Downe's was also present in good form, as was also the still more popular Black Hamburgs, of which there were some excellent bunches of a deep jet black. White Grapes were Muscat of Alexandria and Trebbiano, both good, and possibly there might be another kind or more; but all being good, the number of varieties is of less consequence. What struck me as being remarkable was the fact that the house in question had produced similar crops for two or three years past without any signs of abatement of quality, more than one of the neighbouring gardeners who had witnessed them affirming this; and certainly taken in all its parts the

whole did Mr. Donaldson, the very able gardener here, the greatest credit as a Grape-grower. I suppose the border in which the roots found a becoming home is the secret of the success; and if we be guided by what appeared to be the general character of the soil of the neighbourhood, a rather dark-coloured loam interspersed with gravel of a flinty kind, but not overdone with this; and at no great distance from the garden I noticed that amongst standard fruit trees Cherries seemed to attain a larger size than they do in most places; while in the park the Oaks were unusually healthy and fine. There were good Grapes also in other houses, and in a house devoted to the cultivation of greenhouse plants I noticed a very fine Camellia, which must at the time when it is out be a handsome object, while other plants were also well represented; but as Mr. Donaldson had removed so many to ornament the large tent in which the cottagers' productions were being exhibited, and the season also being one in which plants in houses are but little cared for, the plant houses were necessarily thinner than usual, but all were in good order.—J. ROBSON.

NOTES ON VILIA AND SUBURBAN GARDENING.

Frost and snow having come upon us in real earnest it is best to stop most of the operations on the ground, for working snow in with the soil or treading upon it when in a wet state, such as it is just now in most places, is calculated to make it work unkindly, and will prove a drawback to successful culti-

vation. It is much best to arrange the work so that the trenching, digging, or ridging may be the last operation, so as to leave the soil uninterrupted in its rough state. It is a well-known fact, particularly with heavy soils or those too much impregnated with manure; nevertheless, even in such weather as the present, not even in small gardens will it do to let things go without some attention, for everything ought to be well protected, if not done as previously advised. The other day in a small garden I saw a crop of both *Mazagan* Peas and Peas well above ground, especially the latter, which were, I should say, 3 or 4 inches high, and looked healthy. Now, undoubtedly if these are not protected, and most thoroughly so too, they will scarcely survive a very severe winter. It is not so much that the frost injures them, though they both turn a yellow colour through the cold, as the sharp cutting winds that have play upon them. I have never advocated the very early sowing of such things, having so frequently witnessed and experienced a failure to procure anything like a satisfactory crop, though they may come some days earlier. The biting winds of about February or March have many times cut the shoots off as if with a knife; therefore when such things are well up out of the ground they must be protected by any means. The next things are Sea-kale and Rhubarb, which if forced on the bed, as many people do, with dung and leaves, and they have started to make growth, the greatest possible care must be paid that the heat does not fall too low, which if the crowns did not rot they would be so crippled in growth as to be afterwards next to useless. Next we come to newly-planted trees, such as those fresh from the nursery, which must at once be protected at the root by rough material of some kind; and in the case of such tender-wooded trees as Peaches, Nectarines, or Figs, it is a good plan to envelope the whole tree in straw bands, or whatever can be best procured, during the severest part of the winter. Where Strawberries in pots cannot be taken entirely under cover, they, too, must be well protected. But there is one thing I should like to mention, and that is that when a period of severe weather breaks up, and a period of mild weather is likely to follow, the protecting material should be immediately taken from such things as Celery, Artichokes, and Strawberries, or such other fleshy plants as have been so treated, otherwise decay soon sets in.

If frames containing bedding and other plants have not been well protected at the sides, they should be so treated at once, and little else can be done; for it will not be safe to open the frames for any operation, except giving air for an hour, if possible, at midday.

The greenhouse and conservatory will now be the places most visited, and the temperature of neither should exceed 50°, unless one or both contain plants of a more tender nature and require a higher temperature; or sometimes such places are the only ones available for bringing Hyacinths, Tulips, Narcissus, Spiraes, Lily of the Valley, and a few forcing shrubs, such as Lilacs, Azaleas, Deutzias, &c. Even then it is not advisable to start them at a high heat—one of 50° will suit at present, with an additional 5° in the day; but they must be frequently syringed, though not so as to deluge them till they have made a fair growth and receive a higher temperature; they ought also to have all the light possible in these short days. The above, if all grown in one house, and that house large enough, they should have the warmest end of it; but when they come into flower, or are so now (such as the early Roman Hyacinth no doubt is, being an early bloomer), it should be placed in the coolest part. Now this class of bulbs are very fast growers, and require a deal to support the noble spikes of bloom they produce; they also make numerous fleshy roots very fast, and they must therefore be liberally supplied with water, added to which must be a little liquid manure just sufficient to colour it. If given at every turn after they have thrown up their spike or bloom-head they will be much improved by it. Camellias, whether in pots or planted out, ought to be supplied with liquid manure frequently, because these plants generally have hard work to push out all their buds left on them into full-blown flowers unless assisted in this way; but it must be understood that there must be a liberal, free, and open drainage under the plants, because stagnant water about their roots not only throws the plants into an unhealthy state, but will be a great step towards making them shed their buds, as many people often complain about in their plants. Where the opportunity presents itself I would advise that in the small greenhouses we often see attached to villa residences a Camellia or two should be planted out, instead of being grown in a pot; they grow into plants so much quicker, because the treatment is more to their natural requirements, and in this way the flowers are more numerous and larger, more perfect in form, and the plants themselves, though not being so cramped at the root, generally maintain a luxuriant and healthy appearance.—THOMAS RECORD.

DOINGS OF THE PAST AND PRESENT WEEKS.

The heavy snowfalls with frost have quite put a stop to operations in the out-of-doors department. The only work that

can be done with advantage is turning the manure or vegetable-mould heaps; or if it is intended to put fresh gravel on the paths, this should be dug out of the ground and sifted. It adds very much to the enjoyment to be derived from a garden if the paths are kept in good order. The most comfortable paths to walk upon are those that are well drained, and having the roughest portion of the gravel placed over brickbats, and some of the finer siftings on the top, finishing off with the middle of the path slightly higher than the sides—just so much that it can scarcely be perceived by the eye, and not at all to inconvenience those walking upon it. When the gravel binds, as it ought to do on such a path, the rainfall escapes to the sides, so that the surface is seldom wet. In wet districts we have seen paths made in a different manner. The gravel is first run through a very coarse sieve to separate the large stones, which are used for the bottom, then through one with a finer mesh to separate the sand and very small stones. This finer portion is not used in the composition of the path at all; the portion remaining will not bind, and is the best path to walk upon in very wet weather. We have plenty of work for the men during a long storm, as our extent of glass structures is large for the size of the place, so that it is cheaper to purchase labour than it is to make them ourselves. Flower sticks we would obtain in the same way if they were made to our liking, but they are always too clumsy, especially the smaller sizes. The best material to make sticks from is ordinary double laths, and a man can make sticks from these laths as fast as he can reduce those that have been made too thick to a serviceable size.

For protecting the plants in frames, pits, &c., mats are used; but a protection that will keep out quite as much frost as double mats may be made from straw, and any handy labourer who had never seen them made could be instructed in a few minutes. A very small portion of straw (any sort will do) is taken up in the hand, and firmly tied at one end, more straw is added to the length until a rope of straw is made as long as the frame to be covered is wide. The ends of the ties are not cut off but left long, so that more straw may be added and tied in the same way, continuing so until the covering is as long as the frame. We have made and used these coverings, and have found them to be one of the very best protections against frost. Two men can make a large quantity of such coverings in a day or two. Pegs should also be made now, and laid aside for use until required. The best pegs are made from Elm branches. The small sprays that are cut off when trimming-up flower sticks are used for this purpose. A number of good Verbena pegs can also be cut out of an old birch broom. Indeed the gardener in his interest will take care that no prunings of Elm, Birch, or Beech trees will be wasted until he has had his supply of pegs for the bedding plants, Strawberry runners, &c.

VINERIES.

The late houses where Grapes are hanging do not require more attention than to keep the atmosphere dry without overdoing it. There would not be much difficulty in keeping the berries from becoming mouldy if the proprietor preferred the berries shrivelled like the dried Grapes imported from Spain. There are two causes that conduce to the fruit losing its moisture so far as to cause the skin to become wrinkled. The first is an overdry state of the atmosphere, caused by continuously heating the hot-water pipes; second, by the border in which the roots are growing being too dry. If this is the reason, not only will the present crop of Grapes be deteriorated in value, but the Vines will be much injured for next season's crop, as the buds will fail to plump-up and become fully developed. This is not likely to happen, however, if sufficient water has been applied during the growing season of the Vines, and a good soaking given as soon as the fruit begins to colour. If through any mischance the border does become too dry, we would rather water after the fruit is ripe than allow the Vines to suffer. It cannot be too earnestly impressed on all the necessity of looking over the bunches at least every week, and cutting-out all mouldy berries. All the leaves have been picked off the Vines both in Muscat and Lady Downe's house, except on two rods of Mrs. Pince's Black Muscat, the leaves of which are not ripe enough. Mrs. Pince is a fairly good Grape, but it does not keep so well as anticipated; it seldom colours well, and nearly all the gardeners who come to look at our fruit say that it sets badly. It sets well in the Muscat house with the same treatment that Muscat Grapes require. In the early house, except keeping up a supply of moisture in the atmosphere, and seeing that the temperature does not fall below 45° or rise above 50° at night (while the weather is so cold) until the buds start, no other attention has been required. Roses or any other shrubs or flowers that have been introduced to force with the Vines must not suffer for want of water at the roots. Unless the pots are over the hot-water pipes not much water will be required; but if they suffer the growths will be weakly, and the usual insect pests will find a more congenial home upon them. Syringing at least every day causes the buds to break freely and strongly.

FLOWER GARDEN AND SHRUBBERY.

Nothing will be done to the flower-beds while snow lies thick

on the ground; but if any of the beds required to be trenched and manured we would do them. The snow could be swept off as the work progressed, and one set of men would wheel the manure while the others continued with the trenching. The depth of snow prevents the frost from taking any effect on the surface. Trenching may be done when the ground is frozen deeply, but it is not desirable. The first thing to do after a steady fall of snow is to look over coniferous and other evergreen trees; any that are in danger of being broken should have the snow shaken from them. We are preparing to plant a few specimen trees by digging-out holes 2 feet 6 inches deep and 6 feet diameter. There is a depth of 9 inches to 1 foot of very light soil, and quite half of it is stones, the remaining portion is gravel, in which no trees will thrive. This gravel has to be wheeled away and loam put in its place. The few trees that have been planted thrive well with this treatment. In the course of three or four years the diameter of the hole requires to be enlarged by 3 feet, which gives a further space of 18 inches wide for the roots to travel into. When coniferous trees have been dug round in this way it has been found that the roots have travelled into the gravel.

Bedding plants are being potted-off from the boxes in which the cuttings were struck. The largest proportion of bedding plants succeed best if they are grown in boxes, but an exception to this is to be found in the different sections of zonal or bedding *Pelargoniums*. These we invariably pot; the smallest plants in 60-sized pots, the larger in 48's. The houses where the plants are placed is kept warmer than a greenhouse, and the atmosphere is dry. We do not require many *Verbena* cuttings this year, else preparation would soon have to be made for striking the cuttings; these do well in a temperature of 55° and a moist bottom heat of 85° or 90°. *Calceolarias* in boxes are still in a cold frame behind a north wall. They were put in late, and only a portion of them seem to be rooted as yet. The lights are protected by mats from severe frosts. As the larger outer leaves of *Auriculas* die they must be picked-off, as they rot and are the cause of decay. We draw the lights quite off the frames if the frost is not severe and the sun shines in the day. Large plants do not suffer if no more water is applied to them until February, but if the small offsets are dry they may be benefited by a little water. We are also careful not to allow any rain to fall on them. Carnations and Picotees require very similar treatment to the *Auriculas*, except that it is very undesirable to allow any of the pots to become dust-dry; but if the soil in the pots was sufficiently moist early in December they will not require water more than two or three times until the first week in February. We air the frames on all favourable occasions.

Hollyhocks and Dahlias are not such universal favourites as they were twenty or thirty years ago, but both plants are indispensable in large gardens, and thanks to such enthusiasts as Turner, Keynes, Rawlings, Laing, Chater, Hawke, and others, very great improvements have been made in them. The *Dahlia* roots should be in a cool shed, but, of course, frost must not reach them; damp is also injurious, and shows its presence by causing a white mould to gather round the neck, which spreads down to the tubers and destroys the incipient growths. *Hollyhock* roots are best planted in a cold frame in light loam; they may be planted quite thickly. Air the frame freely, but protect from rain. Any plants that are weakly, and of which there is not likely to be sufficient stock, should be potted-up and placed on a shelf near the glass in a cool house.—J. DOUGLAS.

TRADE CATALOGUES RECEIVED.

Sutton's Spring Catalogue for 1875.—Amateur's Guide.—Sutton & Sons, Reading.—This is copiously illustrated with excellent chromo-lithographs and woodcuts.

R. Dean, Ealing.—*Catalogue of Choice Potatoes.*—*Catalogue of Primulas and other Plants.*

TO CORRESPONDENTS.

*. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

BACK NUMBERS (*Sussex*).—You can have them all post free if you enclose 3s. 6d. with your address.

ASHANTEE LEAF (*Rosa*).—Many associations with Guernsey would induce us to aid you, but it is impossible. No one could identify a plant from a leaf such as that you enclose.

DESSERT KEEPING APPLES (*A Subscriber*).—Adams's Pearmain, Dess Pool, Claygate Pearmain, Cockle Pippin, Cox's Orange Pippin, Golden Reinette, Margh, Nonpareil, Ashmead's Kernel, Sturmer Pippin. The tree is a *Fedocarpus*.

PROTECTOR ON VINES (*D. B.*).—The excrescence on your Vines is a true gall, caused by the deposition of the eggs of the destructive weevil *Othiorhynchus sulcatus*, the grubs or larvæ of which you have extracted from the swelled part. The cause of the spreading of the disease to other Vines is simply that of the female insects creeping from plant to plant. The protuberances should be carefully opened and the grubs destroyed, and in the spring the plants should be looked over after dusk, as the parent insects are nocturnal in their habits. They are also very timid, falling to the ground when alarmed, so that it is advisable to lay sheets of white paper under the trees, on which they may be easily seen.—I. O. W.

CROSS-BREDED FLOWERS (*Bayford*).—The most successful mode of obtaining good and very distinct varieties is to employ the pollen from a male flower grown on another plant than that bearing the female parent. To avoid previous and undesired impregnation, the anthers in the female parent, if they are produced in the same flower with the pistils, must be removed by a sharp-pointed pair of scissors, and the flower enclosed in a gauze bag, to exclude insects, until the desired pollen is ripe. Another effectual mode of avoiding undesired impregnation is bringing the female parent into flower a little earlier than its congeners, and removing the anthers as above described; the stigma will remain a long time vigorous if unimpregnated. When double flowers are desired, if a double flower should chance to have a fertile anther or two, these should be employed for fertilisation, as their offspring are almost sure to be very double. To obtain a change of colour apply the pollen from a flower of the same species that has the desired colour.

FOWLS' DUNG (*A Constant Reader*).—It is a very powerful fertiliser. Mixing lime with it is not advantageous. It is applicable to all vegetables.

STOVE (*Erigidae*).—We do not know the stove you mention, and cannot judge between rival inventions.

CHERRY TREES GUMMING (*L. J. K.*).—We advise you to get your trees on the *Cerasus Mahaleb* stock. May Duke is one of the hardiest, and Governor Wood is also a very fine early Cherry; the trees are hardy also. Do not place any manure near the roots unless it is well rotted, but it is not necessary if you can take the following advice.—Dig out a hole 4 feet in diameter and 18 inches deep, remove all the soil, and fill-up with rotted turfy loam. Mix no manure with it, and in this plant your trees. Do not allow the ground over the roots to be dug at all.

TWELVE BEST HYACINTHS (*H. W. S. C.*).—We should select Lord Derby, Jardin des Plantes, Pink Perfection, Gloria Mundi, Nil Desperandum, George Clenny, Antioch, Queen of England, Mrs. George Rudde, Lady Slade, John Salter, and Baron Buns.

IVY BORDER FORMING (*J. K.*).—There is no difficulty in forming an edging or border of Ivy. All that is required is to plant nice young plants of any of the neat-growing kinds, as *Hedera Donnellensis*, *H. taurica* in the green-leaved, and *H. argentea elegans*, a fine variegated kind for edging, planting at 18 inches distance apart, and train the shoots as they grow so as to cover the ground, to meet first, and then to the width required, to which they may be kept by cutting. If small plants, they ought not to be planted more than a foot apart to have an edging quickly. The Moor is a fine dark-zoned *Gemanium*, but Mrs. John Lee has the boldest zone of any, and is a good bushy grower. *Santolina incana* is a neat, dwarf, compact, silver edging plant about 3 or 4 inches high.

APPLE TREES CANKERING (*G. C.*).—We did not intend to denounce your trenching and making the soil deep before planting, but to convey our opinion that when the roots had passed through this, the subsoil being unfavourable, it would help you none in preventing canker in the trees. You were quite right in trenching the soil, not bringing up any of the bad soil, and planting high. By surface-dressings the roots may be kept at the surface, or be induced to extend horizontally near the surface, and so kept from descending into the unfavourable subsoil. Making a hole in hard ground and leaving the other undisturbed is not planting trees, but sticking them in without giving them a chance.

FEARNY AMONGST TREES (*Idem*).—It does not answer to cover the stems of large trees by a bank of rockwork and soil close round the bole. We lately removed several tons of rock and soil from about the stem of a large Ash, the tree having shown indications of injury, and since it was removed the foliage is better. Keep the rockwork clear of the stems of the trees.

TRICHRIS HIRTA CULTURE (*E. S.*).—This fine hardy Japanese plant is not sufficiently hardy for your northern high and cold climate, though, from its free growth, we do not see but that it would succeed as a hardy plant with you in a sheltered spot. We do not think we can improve upon your culture, which each October gives you a plant with "fine foliage, covered with buds, and looking thoroughly healthy," and no doubt it is; but the placing of this and many other hardy plants in the dry atmosphere of a greenhouse or room causes the plants to go to rest and cast their lower leaves—the oldest first, and then the others, one after the other, until nothing remains but the flower-stem and buds. Were you to plant it out it is likely you would have its flowers in perfection in a mild season in winter; or were it placed in a cool house in a light, airy, and moist position, or better still, in a cold pit, it would flower perfectly in early winter and onward. With us it loses its leaves. We treat it the same as *Lilium*, removing to a cold pit in early autumn or a cool house along with *Chrysanthemums*. We think the flowers are very pretty, being so finely spotted with purple on a white ground.

SHRUBS FOR SHADED BORDER (*H. T. P.*).—The best of all is the *Aucuba japonica*, then Tree Box, Butcher's broom, Evergreen Privet, common Laurel, common Holly, and English Yew, with St. John's-wort and Periwinkle as undergrowth, also Ivy. If the ground is not very much occupied with roots and is dry, *Rhododendron ponticum* succeeds fairly, and in some instances we have found *Laurestinus* do well. Plants for the border may be *Alyssum saxatile* compactum, *Anemone apennina*, *A. japonica*, *A. nemorosa flore-pleno*, *Arabis alba* and var. *variegata*, *Aubrietia deltoidea grandiflora*, *Caltha palustris flore-pleno*, *Campanula aggregata*, *C. rapunculoides*, *Convallaria polygonatum*, *C. majalis* var., *Delphinium Belladonna*, *Funkia undulata variegata*, *Helleborus niger*, *Hyacinthus amethystinus*, *Hypericum calycinum*, *Iris germanica*, *Meconopsis cantabrica*, *Myosotis disitiflora*, *Nepeia Mussini*, *Paeonia alba* var., *P. officinalis* var., *Primula acutis* var., *Pulmonaria angustifolia*, *P. officinalis*, *Ranunculus amplexicaulis*, *Spiraea filipendula plena*, *S. japonica*, *S. palmata*, *Dicentra spectabilis*, *Trollius europæus*, *T. napellifolius*, *Viola encellata*, and *Violets* in variety. The border, we presume, is not over-bung, but only shaded by the trees. Ferns that would do are *Osmunda*

regalis well supplied with moisture, *Lastrea Filix-mas*, *L. dilatata*, and vars. of both; *cristata*: *Athyrium Filix-femina* in vars., *Oncoclea sensibilis*, *Polypodium vulgare*, *Polystichum angulare* vars., *P. aculeatum*, *Struthiopteris germanica*, and *Scelopendrium vulgare* vars.

MUSHROOM BEDS FAILING (H. H.).—The failure cannot be attributed to the spawn as Mushrooms have showed, but the spawn being a year old will account for the smallness of them. The fault, we think, rests in the materials of which the beds were made being too dry. They having appeared when the beds were covered with hay, inducing moisture and the Mushrooms to appear, would lead to the conclusion that the beds were too dry, and the atmosphere also too dry and cold. We never cover the beds with hay or anything. In six to eight weeks after spawning the Mushrooms begin to appear, and we then by light sprinklings of water, which has stood in the house twenty-four hours, bring the bed into a thoroughly moist state, and the Mushrooms come up over the whole surface gradually, the bed being seen to about every second day, and all the dry places are damped, and the walls and every available surface is damped. A temperature of 50° to 55° is advised by almost everyone, but ours will not come on at all without a temperature of 60° to 65°, and that it answers we may state that we have beds commencing to bear in October which continue to do so up to May. Your failure we attribute to the dryness of the materials and of the bed when the Mushrooms were appearing, with too dry and cold an atmosphere.

MESSEMERIANTHUM CORDIFOLIUM VARIEGATUM PROPAGATION (C. L. E.). The cuttings strike freely in summer in a cold frame without heat, or in autumn (which is not a good time) and spring in a gentle heat, the cuttings being inserted in sand over very sandy soil, the base of the cuttings just resting on the soil, which may be equal parts sandy loam, leaf soil, and silver sand, the pot or pan being well drained, the compost put in rather firm, and surfaced with half an inch of silver sand. Water gently, and stand to dry for at least six hours, then water again, and after standing another six put in the cuttings so that they are not crowded. A very gentle heat only should be given, and no water, shading from bright sun, and avoid damp. The cuttings are the better of being dried a few hours after making prior to insertion.

ROSES FOR UNDER GLASS (X. N.).—Marechal Niel, Belle Lyonnaise, and Sombreuil. Mackintosh's "Book of the Garden" will meet your requirements; through any bookseller.

SOWING ROSE SEEDS, &c. (M. R.).—The hogs will, we presume, have been gathered. Keep them in a flower-pot in dry sand until the first week in March, and then break them in pieces, and then sow in pots filled with light rich soil, and cover the seeds about half an inch deep. The pots should be plunged to nearly the rim in a sheltered position, or they may be sown in the open ground without pots. Precautions must be taken to keep off mice by fine wire netting, fixed at about an inch from the soil, but coming down to the rims of the pots. The seedlings will appear in May, or not until the second year. When the seedlings have three or four leaves put them off singly, and place in the shade for a few days, and when the pots are full of roots plant out in rich soil in an open situation. The best time to dig the rosetry is in February, or so soon after as the ground is in a favourable condition. The best time to put in Rose cuttings outdoors is in September, the latter part, or early in October, on a north border.

SALT WITH ICE (J. C.).—It is a very old practice, and considered to solidify the ice, but has been found to answer no useful purpose. We find it keep as well without as with salt.

PAINT FOR HOT-WATER PIPES (Item).—Lampblack brought to the consistency of rather thin paint with linseed oil boiled is the best for applying to hot-water pipes. The pipes ought to be made quite hot—as hot as possible, and the pipes then painted, thoroughly brushing it in. It will only smell until it is dry; but if put on when the pipes are cold, every time the pipes are made very hot for a long time the pipes will give off an unpleasant smell. Give air freely until the pipes are dry, or rather the paint. We cannot answer for its effect upon Vines or plants, but do not think with air there would be any injury. Ours are always done when the house is empty.

GROS COLMAN VINE GRAFTING (A. B. C.).—Gros Colman would not, we think, succeed upon Foster's Seedling, which is not so strong a grower, Gros Colman being a very vigorous and robust grower. Lady Downe's would be better, and it is one of the best late Grapes. Foster's Seedling is a tolerable late Grape, keeping in good condition for about two months after being ripe.

ADIANTUM FARLEYENSE WITHERING (Item).—From cold and the dry atmosphere the fronds withers. The atmosphere should be kept very moist, and this without heavy or any syringing overhead at this season, though ours receive a very light sprinkling twice daily, and is not in anywise injured. It is better, however, avoided, maintaining a moist atmosphere by frequent sprinkling of the paths and surfaces immediately about the plants. They should have the soil kept moist.

INSECT (Alec. Gardner).—It is not a perfect insect, but the chrysalis of one.

CRYSTALLISING FLOWERS (M. D.).—We know that it may be effected by dipping them into a saturated solution of alum; the alum forms crystals on them. Will some of our readers send us details?

MANURING PEAR TREES (W. H.).—Decayed stable manure spread in early spring on the surface an inch thick about 3 feet from the stem. Our "Fruit Gardening for the Many" contains full directions for grafting.

VINES FOR VINERIES (Newsorth).—Not knowing how the two vineries are to be heated, nor whether you wish for early or late Grapes, nor, in fact, anything about the vineries or your intentions, we can only say in one viney you may have Black Hamburgh and Lady Downe's, and Bowood Muscat and Trebbiano in the other. The two last-named should be in the warmest viney.

NAMES OF FRUITS (J. F. Smith).—No. 1, Winter Hawthorn; 2, Court-Pendu-Plat. (C. R. S.).—1, Brown Beurre's 2, Napoleon; 3, Marie Louise.

NAMES OF PLANTS (Schubert).—1, *Adiantum*; 2, *Melastoma hevigata* (?) *L.*; 3, *Thysanotus Schomburgkianus* (*Bot. Mag.*, 4551); 4, *Eranthis nervosum*; 5, *Tradescantia discolor* (*Jacob*).—*Peristrophe speciosa*. Fern indeterminate. (*Orchid*).—*Zygopetalum Mackaili*. (*J. G.*).—*Peristrophe speciosa*. (*Winchester*).—*Photinia serrulata*, serrulated-leaved *Photinia*. It is a native of China and Japan. It has been called *Mespilus glabra* and *Crataegus glabra*, and a portrait of it under the name last mentioned is in the "Botanical Magazine." (*C. L. D.*).—1, *Selaigella caulescens* (?); 2, *Scelopendrium vulgare*, var. *proflerum*; 3, *Lastrea Filix-mas cristata* var.; 4, *Aspidium angulare*. (*An Ignorant Lady*).—1, *Adiantum hispidulum*; 2, *Aspidium coriaceum*; 3, *Davallia (Loxocleph) zibberosa*; 4, *Polypodium aureum*; 5, *Nephrolepis exaltata*; 6, *Athyrium Filix-femina*. (*J. Bale*).—We only name

six specimens at once. 1, *Polypodium vulgare* (?); 2, *Asplenium bulbiferum*; 3, *Adiantum Capillus-Veneris*; 4, *Pteris serrulata*; 6, *Adiantum hispidulum*; 7, *Aspidium falcatum*.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE CRÈVE-CŒURS AT ASHFORD.

Your reporter's remarks on the judgment of the French classes are rather severe, and they would be fully justified had the awards been made as they appeared in the prize list and on the pens; but that was not so, for there was an error, by whom I know not.

Whom your reporter refers to as a novice I do not care to ask, but I will venture to assert that the awards in these classes were correctly made; and in justice to my colleague I may say that there were no two opinions as to where the first in Crèves should go, both of us hitting upon Mr. Dring's pen (213) at once, and 244 for second, 245 being unnoticed, and the rest all highly commended; in confirmation of which I herewith forward my judges' book for your inspection. When I left immediately after the adjudications were over I had a catalogue marked, by one of the officials, handed to me, and when comparing this with my book I found the error. Mr. Long was with me in the train, and at once undertook to apprise Mr. Dring of the error; and on my arrival in the City I wrote Mr. Stickings, the Secretary, but I am afraid the letter has suffered the same fate as the catalogue which I posted to you at the same time, and which never arrived at your office.—E. HUTTON, *Pudsey*.

THE EXHIBITION DORKING.—No. 3.

BY T. C. BURNELL.

LIKE any other pursuit, success with prize poultry is only to be attained by paying great attention to numerous small details. Anyone expecting to breed and rear valuable birds without any trouble will be most certainly disappointed, while at the same time I think there is no stock which will so well repay any labour that may be expended upon it.

It is often said, "How lucky So-and-so is," but depend upon it there is very little luck about it, or we should never see the same exhibitors so continually coming in at the top of the prize list. Occasionally, either when birds get into a dark corner or the judges are overworked, a slight error may occur, but such is sure to be rectified at the next show.

It may seem a small matter where and on what our birds roost, but such will not be found to be the case. No very elaborate place is required, and in most stable-yards there is some shed or outbuilding which may readily be converted into a poultry-house, provided only that it is dry and light. If the floor be of brick or stone such had better be removed or covered over with 3 or 4 inches of earth or sand, as cold floors are generally thought to cause disease. One of the most necessary points is that the house should be well ventilated without being draughty. Fresh air cannot hurt anything, but a chilly draught blowing right across the perch is very different. The best way to provide fresh air without a draught is to have two or three good-sized openings in the top of the south side of the house, which must not be too low, and for the perches to be placed some way below the ventilators.

If the house be dark the fowls will not enter if they can possibly help it, while if we have a sliding window it may be advantageously taken out in summer to allow the entrance of fresh air.

The inside of the house should be limewashed occasionally—a simple and inexpensive operation, which will go a long way towards preventing disease, while the floor and perches should be cleaned at least twice a week (better still every day), and chloride of lime, carbolic acid, or some other disinfectant sprinkled about. McDougall's disinfecting powder is very convenient for this purpose, also for sprinkling the nests with, and I believe if these precautions were generally adopted we should hear less of vermin in fowl houses—at all events, I never have such a thing in my own.

As Dorkings are such large, massive fowls, the perch should not be placed too high from the ground, otherwise in descending from roost of a morning the birds are apt to injure the ball of the foot, a fertile cause of the inflammation which is called bumble-foot, and which I will allude to under the head of Diseases. The perches should not be more than 15 or 18 inches from the ground, they should be quite flat, and at least 3 inches wide. I constantly see advice to the contrary, but I am convinced that crooked breasts, though sometimes hereditary, are nearly always caused by round perches, while small narrow perches cause curved and crooked toes. Very young chickens will require special treatment, which I will describe later on.

One house and run will not be sufficient if we wish to keep poultry for exhibition; at least two runs will be required for the breeding stock, and also if possible separate runs for the cock-

erela and pulleta. The latter may be dispensed with, and the chickens allowed to run with the old birds, but certainly not to the advantage of the chickens. A very mistaken idea prevails as to the amount of grass run required for Dorkings; if they have five acres they will certainly make use of it, but my own stock birds have never had more than a run of 10 or 12 yards square for each cock and four or five hens, and have always laid and thriven well upon it, while in the show pen their condition has generally been as good as the best; and this is a sure proof to me that no larger run is required, as if fowls are discontented and restless they will rapidly lose that brilliancy of plumage which so surely tells in the prize list.

A single cock for exhibition may be advantageously shut up in a small place if carefully attended to, but the hens become restless in very close confinement, and do not do well under the space I have named. Small shrubs or fir trees planted in the corners will form a pleasant shade in summer, as also will Jerusalem artichokes, which are to be strongly recommended on

account of their hardness and rapid growth. The fences to separate one run from another in my own case are made of hurdling or "wattling" about 3 feet high, with 3-foot wire netting stretched loosely along the top. I have found this quite sufficient to keep the birds in, as Dorkings usually are but poor flyers. If hurdling cannot be obtained, half-inch boards of red deal to the height of 2½ feet, will do as well, but will, of course, be more expensive. Simple wire netting, however small the mesh, is not sufficient near the ground, as if the cocks can see one another they will fight through it a great deal more than if at liberty, and will never seem to get tired of it, while if at liberty one soon conquers the other, and it is all over except the crowing! If it is determined to try to induce two strange cocks to run together, the only way is to treat them like two school boys, and having put bits of cork on their spurs, to let them "have it out." If you separate them they are sure to be "at it again" immediately your back is turned.

It will be found very much cheaper in building houses to make

Fig. 163.—FRONT VIEW OF PAIR OF POULTRY HOUSES.

Height at top, 6 feet.
Height to eaves, 4 feet

Width of each house, 4 feet.
Depth, 4 feet.

A, Dusting sheds.
B, Sliding door

C, Ventilators.
D, Moveable windows.

Scale half an inch to the foot.

them in pairs. The accompanying sketch represents the front view of a pair made in the very simplest way, and with the smallest amount of material, and yet I think combining every essential for health and comfort. I have found thin sheet zinc far preferable to felt for roofing, as it is much more durable, and not finding any hold for their claws, the fowls will very soon get tired of flying up on it. A double house of the dimensions described, made of three-quarter-inch deal with zinc roof, should be constructed for about £5 or for less, if, as in my own case, the carpentering be done at home, and really if the planks are already cut out there is but very little carpentering about it, while we shall always think more of our "villa," if made with our own hands. The cracks between the boards had better be covered over with narrow strips of very thin deal, or the boards can be let into one another; but this will be found more expensive.

The little outside sheds are for the fowls to get into in wet and windy weather, and they should always be filled with dry earth or road grit, in which the birds will delight to dust themselves; while being placed outside the roosting houses they will help to keep the birds warm.

ABERDEEN POULTRY AND PIGEON CLUB SHOW.—This Society will hold their next Show early in January. The entries close on the 25th of December. As regards Pouter it will be the Show of the season, the principal breeders in Scotland intending, we understand, to exhibit largely. There are twenty-two classes for these birds—viz., Red, Yellow, Black, Blue, and White, cocks and hens, both old and young, besides two classes for off-colours, one for cocks and the other for hens. We hope the entries will be of such extent as to compensate the Society. Observing that no two of the standard colours of Pouters are to be shown

in one class, anyone having a good bird has every chance of having its merits acknowledged. Mr. Corker, of London, is to judge the Pigeons. This Society has carried on its exhibitions hitherto at considerable loss. The money they cannot afford to lose, but the time and trouble they do not grudge for the advancement of the fancy. This Show will decide whether or not they will be able to continue their exhibitions.

TREDEGAR POULTRY SHOW.

The annual Show of the Tredegar Society was held on Tuesday and Wednesday the 15th and 16th inst. The poultry and Pigeons were exhibited in one of the excellent sheds of the Cattle Market. As last year, so this, Turner's pens were used, and proved much better than the old wicker coops. While in the hands of Mr. Pulling the birds are well attended to by an excellent staff. A few pens were empty, but not near so many as in previous years. Game were a good entry, and the cup for the first eight classes was given to a very stylish pair of Brown Red chickens. Spanish were good, especially Mr. Moore's chickens; but Dorkings were only poor in both classes as compared with what we have seen here. Cochins in both classes were very good, Buffs winning three out of the four prizes, and Partridge chickens one. In old Light Brahmas Mr. Dean won both prizes, as also in the chickens, carrying off the cup also for the section with young birds. Mrs. Roll's pen, said to have won the cup at Swansea, were in bad order; cock bare on the throat, and the hen a bad colour. Dark were good, Mr. Watts securing both first prizes with grand birds; many other pens being noticed. Many pens of Hamburgs showed the effects of overshadowing, this being the case especially in the Gold-pencils and Spangles, while the Silver-pencils and Spangles showed much better, and the cup was awarded to what turned out to be the Crystal Palace cup

cock, a truly grand bird, and yet he only won very narrowly, Messrs. Mitchell and Long coming close. *Polands* good, but not numerous, and *French* a fair lot. In *Bantams* Game were good as far as the winners went, Black Reds being successful, and also carrying off the cup. First and second Blacks very smart and good, rest moderate. In the Variety class of Bantams Silver-laced were first, Booted second, and Gold-laced third. We think the judging of the Bantams very erroneous. Rouen Ducks were a large class, and many pens were noticed, the first by Lord Tredegar were very cheap at the catalogue price. Aylesburys were a fair lot, but not equal to the Rouens. *Turkeys* were 453, 44, and 43 lbs. weight in winners, and both these and the *Geese* were good classes. The Selling classes were immense, but the Duck class poor.

In *PIGEONS* Mr. Yardley won the point cup, but was pretty well run by Mr. Holloway; and the birds were better than we recollect to have seen them, and the entries very good.

GAME (Black or Brown-breasted Reds).—2, G. S. Cole, Llanelly, Carmarthen; H. Banks, Worcester; J. John, Ton Pentre Ystrad, Pontypridd. c, Rev. C. T. Salusbury, Tredegar Rectory, Langibigh, Newport; H. Feast, Swansea. *Chickens*.—Cup, H. E. Martin, Sculthorpe, Fakenham. 2, Rev. C. T. Salusbury, vhc, H. Horton, Colwell, Malvern; G. S. Cole, hc, R. Shell, Cardiff. c, J. W. Jones, Malpas, Newbury.

GAME (Any other variety).—1, W. L. Blake, Llandaff. 2, J. Mason, St. John's, Worcester. c, J. P. Moses, Llandaff, Cardiff; J. T. Brown, St. Austell. *Chickens*.—1, E. Winwood. 2, J. Mason, hc, D. W. J. Thomas, Brecon. c, W. L. Blake; H. P. P. Price, Castle Madoc, Erecion.

SPANISH.—1 and 2, T. Moore, West Butte Ducks, Cardiff. vhc, H. Feast. *Chickens*.—1, T. Moore. 2, Mrs. E. Allsopp, Hindlip Hall, Worcester. vhc, G. K. Chilcott, Esrlawn, Bristol.

DORKINGS (Grey or Coloured).—1, A. Haim, Tredegarville, Cardiff. 2, E. Ponting, Buckland Newton, Cernoe, hc, Mrs. F. Bayard, Gwernyd, Berriew; R. Leysdon, Bridgend, c, Col. F. C. Morgan, Ruperra Castle, Newport. *Chickens*.—1, E. Shaw, Plas Wilmot, Oswestry. 2, R. Leysdon, hc, H. Feast; W. Bevan, Swansea.

COCHIN-CHINAS.—1, E. Winwood, Worcester. 3, H. Feast, hc, J. Watts, King's Heath, Birmingham; C. Bloodworth, Cheltenham; H. Tomlinson, Birmingham. *Chickens*.—1, Mrs. Bidder, Wamechir, Neath. 2, I. Jones, Neath. 3, C. Bloodworth, vhc, Mrs. Allsopp, hc, Mrs. Bidder; C. Bloodworth; H. Tomlinson.

BRAMA POOTRA (Light).—1 and 2, T. A. Dean, Marden, Hereford. vhc, Mrs. Potter, East Court, Cheltenham; J. Watts, hc, Mrs. Rolls, Mowmonth. *Chickens*. Cup, 2, and Extra, T. A. Dean, hc, Mrs. H. J. Bailey, Rosedale, Tenbury; J. Watts, c, Mrs. Harding, Pentwyn, Mowmonth.

BRAMA POOTRAS (Dark).—1, J. Watts. 2, H. Feast. vhc, Rev. J. Cunick, Llanfaes, Brecon; hc, W. W. Cunick, Llanfaes, Brecon; W. Bevan. *Chickens*.—1, J. Watts. 2, E. E. Morgan, Alfred Hill, Bristol. hc, H. Feast; W. Bevan; G. Jones, Goldbourne Hill, Wolverhampton; Bridgewater & Yoxall, Wednesbury. c, M. H. Deso, Cardiff.

BRAMA POOTRAS (Dark).—*Pullets*.—1, T. A. Dean. vhc, G. Dornford, Bryn Hafod, Llandaff; J. Watts; Bridgewater & Yoxall, hc, H. Feast. c, J. A. White, Newport.

HAMBURGERS (Gold-pencilled).—1, C. Bloodworth. 2 and hc, Mrs. Rolls. *HAMBURGERS* (Silver-pencilled).—1, T. R. Mitchell, St. Thomas, Swansea. 2, J. Carr, Swansea.

HAMBURGS (Gold-spangled).—1, J. Carr. 2, T. Blakeman, Tattenhall, Wolverhampton. hc, Mrs. Rolls; T. May, Wolverhampton; I. Davies, Harborne, Birmingham.

HAMBURGERS (Silver-spangled).—Cup, J. Carr. 2, T. R. Mitchell. vhc, J. Long, Bromley Common, c, Mrs. Rolls.

POLANDS.—1, H. Feast. 2, W. E. E. A. Kynch, Abergavenny. 3, C. Bloodworth.

FRENCH.—1 and hc, H. Feast. 2 and c, D. Lane, Hardwick, Gloucester. 3, T. A. Dean.

BANTAMS (Game).—Cup and 3, E. Payne, Cardiff. 2, H. C. Holloway, Stroud, hc, H. Feast. c, E. C. Phillips, Brecon; J. Tarren.

BANTAMS (Black or White, Clean-legged).—1, J. Mayo. 2, J. Watts. 3, B. F. Parrott, Henbury, Bristol.

BANTAMS (Any other variety).—1, J. W. Lloyd, Kington. 2, J. Watts. 3, G. Holloway, jun., London. hc, H. C. Holloway, c, H. Feast.

ANY OTHER VARIETY.—1, T. Southern, Bristol (Black Hamburgs). 2, H. Feast. 3, Mrs. Rolls, hc, Rev. N. J. Bidley, Newbury (White Leghorns); J. Watts, c, Mrs. Potter (Brown Leghorns).

GUINEA FOWLS.—1, Mrs. Rolls. 2, W. H. Young, Driffield, vhc, Mrs. F. Bayard, Gwernyd, Berriew.

DUCKS (Aylesbury).—1, H. Feast. 3, Mrs. Gordon-Canning, Hartbury, Gloucester. c, Col. F. C. Morgan.

DUCKS (Rouen).—1, Lord Tredegar, Tredegar Park, Newport. 2, J. Watts. 3, W. Williams, Brecon. vhc, T. Moore; J. Davies, Bargoed, Cardiff. hc, E. Ponting, Buckland Newton, Dorset; W. Cooper, Abergavenny; R. Leysdon, c, Lord Tredegar.

DUCKS (Any other variety).—1, Mrs. Rolls (Call). 2, Lord Tredegar (Muscovy), hc, Mrs. H. J. Bailey (Call); T. Moore (Call). c, T. Moore (Black East Indian); T. A. Dean (Black East Indian); J. Harrison, Newport (Brazilian).

GESE.—1 and 3, Mrs. H. J. Bailey. hc, S. Hoinfray, Glen Uske, Newport; Mrs. Bidder; D. Jenkins, Christchurch, Newport.

TURKEYS.—1, Mrs. H. J. Bailey. 2, Mrs. Bidder. vhc, Col. F. C. Morgan; J. T. Pinches, Hardwick, Pembroke, hc, Lord Tredegar; J. A. Lyne, Brynhyfryd, Newport. c, T. Moore; J. A. Lyne.

SELLING CLASS.—*Pullets*.—1, T. A. Dean (Light Brahmas). 2, D. W. J. Thomas (Game). 3, A. Sperrin, Bitton, Bristol (Dorkings). 4, J. McConnell, Ewyas Harold, Hereford, vhc, T. A. Dean (Brahmas); B. D. Brooke, Stow Hill, Newport (Gold-spangled Polands). hc, Mrs. Gordon-Canning (Dorkings); H. Thompson, Tredegar, Bridgend (Dark Brahmas); J. A. White, Newport (Dark Brahmas); D. Lane (Houdans); Mrs. Rolls; J. Watts; C. Bloodworth. c, H. C. Holloway (Cochins); N. Hull, Sidbury, Worcester (Light Brahmas); J. A. White (Dark Brahmas); H. Yardley; C. Bloodworth.

SELLING CLASS.—*Ducks*.—1, E. Ponting. 2, J. Harrison. 3, E. Shaw, Plas Wilmot, Oswestry, 4, H. Yardley.

PIGEONS.

CARRIERS.—1, H. Yardley. 2, J. James, Bath. **POUTERS**.—1, W. G. Davies, Swansea. 2, H. Pratt, Hampton-in-Arden, hc, G. Holloway, jun (2).

JACOBIANS.—1 and c, G. Holloway, jun. 2, W. G. Davies, hc, H. Yardley.

TUMBLERS.—1, H. Yardley. 2, G. Holloway, jun. 3, F. Phillips, Newport. vhc, J. T. Price, Abergavenny. hc, W. G. Davies; D. P. Bain, Newport; H. Yardley.

FANTAILS.—1, W. Morris, Ross. 2, J. F. Loversidge, Newport. vhc, H. Yardley, hc, Miss J. Milward, Newton St. Loe; H. Yardley; J. F. Loversidge. c, T. A. Dean; G. Holloway, jun.

TACMPETRES.—1, J. Lederer, Bootle, Liverpool. 2 and hc, G. Holloway, jun. c, W. G. Davies.

ANY OTHER VARIETY.—1 and 3, H. Yardley. 2, D. Lane, Gloucester (Turbits). 4, G. J. Dewey, Gloucester (Yellow Magpies). vhc, W. G. Davies (Archangels). hc, W. G. Davies (Nuns); A. McKenzie, Liverpool (White and Blue Dragons).

c, A. C. Phillips (Archangels); W. G. Davies (Magies); R. Joseph, Rocklesze, Bristol (Antwerps); G. Holloway, jun. (3).

RABBITS (Lop-eared).—1 and 2, W. Llewellyn, Cardiff. c, Miss V. Morgan, Ruperra Castle, Newport.

The Judges were Mr. Hutton, of Pudsey, and Mr. R. H. Nicholas, of Newport.

CAMBRIDGE WORKING MEN'S CLUB EXHIBITION OF POULTRY, &c.

THIS was held in the large hall of the Institute, Fitzroy Street, Cambridge, on December 15th and 16th.

DORKINGS.—1, S. Wallis, Cambridge. 2, J. James, Fen Ditton. 3, Rev. R. F. Smythe, Caxton Vicarage, Cambs. hc, W. H. Denison, Woburn Sands. c, W. Nottage, Northampton.

COCHINS.—1, J. Everett, Hadleigh. 2, F. C. Bentick, Cambridge. 3, W. Mansfield, Cambridge. vhc and c, A. F. Faulkner, Thrapstone. hc, H. Cooper, Cambridge; W. Mansfield.

BRAHMAS.—1 and 3, M. Leno, Dunstable. 2, W. Mansfield, hc, F. Norris, Cambridge (2). W. Butler, Cambridge; W. Mansfield. c, A. F. Faulkner; F. Norris; J. B. Hibbert, Cambridge.

GAME.—1, T. Hawkins, Cambridge. 2, W. Asplin, Cambridge. 3, G. Mann, Cambridge. hc, T. Hawkins; W. Asplin; J. W. B. Rooke, Cambridge; R. J. Livings, Great Shelford (2). c, G. Mann.

HAMBURGERS.—1, M. Leno. 2, A. Silver, Melford. 3, W. R. Tickner, Ipswich. hc, M. Leno; Hon. Mrs. Neville, Cambridge; Rev. F. Tearn, Gazeley Vicarage, Newmarket; A. F. Faulkner; J. F. Miller, Cambridge; J. B. Bly, Wisbeach. c, A. F. Faulkner.

FRENCH.—1, F. C. Bentick. 2, W. Cotlack, jun., Littleport. 3, S. Woods, Cambridge.

BANTAMS.—1 and 3, M. Leno. 2, W. Adams, St. Clement's, Ipswich. hc, C. Hill, Cambridge; Rev. F. Tearn; Mrs. J. V. Longe, Tuddenham Vicarage, Ipswich; G. Mann.

ANY OTHER VARIETY.—1, G. W. Boothby, Louth (Golden Polish). 2, W. Nottage (Spanish). 3, W. D. Townley, Fainbourn (Leghorns). hc, W. Hudson, Cambridge (Spanish).

SELLING CLASS.—*Cock, Cockerel, or Drake*.—1, A. F. Faulkner (Cochin). 2, M. Leno (Brahma). 3, S. Wallis (Aylesbury Drake). vhc, M. Leno (Brahma); S. Lucas, Hitchin (Brahma). hc, F. Fitch, Cambridge (Rouen Drake); G. C. Levitt, Cambridge (Brahma); W. Mansfield (Light Brahma); W. H. Denison (Dorking). c, F. Barlow, Cambridge (Cochin).

SELLING CLASS.—*Hens, Pullets, or Ducks*.—1, W. Mansfield (Brahma). 2, M. Leno (Rouen Ducks). 3, S. Wallis (Dorkings). vhc, Mrs. King (Cochin); J. B. Hibbert (Brahma). hc, F. Barlow (Cree-Coeur and Buff Cochins); J. F. Fitch (Rouen Ducks); Hon. Mrs. Neville (Rouen Ducks); Rev. C. H. Cross, Cambridge (Dorking); W. Wallis (Game); W. Cotlack, jun. (Black Hamburg); A. F. Faulkner (Light and Dark Brahmas); G. Mann (Cochin); W. G. Waters Brigg (Game). c, E. Arnold, Whittleford (Brahma).

DUCKS.—1, 2, and hc, M. Leno. 3, S. Wallis.

PIGEONS.

CARRIERS.—*Cock or Hen*.—1 and 2, W. Minson. 3, W. Nottage. hc, B. Clifton, Cambridge; Master J. W. Massey, Spalding. c, T. Hawkins; G. Mann. *Young*.—*Cock or Hen*.—1 and 2, W. Minson. 3 and c, Master J. W. Massey, vhc, G. Mann. hc, B. Clifton (2).

POUTERS.—*Cock or Hen*.—1, W. Nottage. 2, H. B. Massey, c, J. G. Mann. hc, A. Storer, Peterborough (2); C. Brown, Ipswich; G. Mann. c, J. Atkins, Bedford; R. Roston, jun., Chatteris (2).

TUMBLERS.—1, W. D. Brown, Cambridge. 2 and hc, A. Dent, Cambridge. 3, W. Lee, Cambridge. c, H. Hawes, Cambridge.

DRAGONS.—1, W. Loveday, Cambridge. 2, Rev. W. V. Longe. 3, J. Atkins, c, W. Larkins, Biggleswade.

BARBS.—1, H. B. Massey, Spalding. 2, Master J. W. Massey. 3, W. Larkins, hc, C. Reed, Cambridge. c, C. Norman, Westerfield; G. H. Arrowsmith, Cambridge; W. Loveday.

TURBITS.—1, J. E. Smythe. 2 and 3, G. Mann.

ANTWERPS.—1, T. Hawkins. 2 and 3, A. R. Burrell, Cambridge.

ANY OTHER VARIETY.—1, W. Nottage. 2, G. Mann (Red Jacobins). 3, W. Brown (Nuns). hc, Rev. W. V. Longe (Blue English Owls). c, C. Norman (Black Trumpeters).

SELLING CLASS.—*Cock or Hen*.—1, Master J. W. Massey (Barb). 2 and 3, G. Mann (Pouter and Fantail). hc, H. Hawes (Fantail); G. Mann (Blue Turbit and Jacobin). c, G. H. Arrowsmith (Blue Turbit); E. Alderson, Ipswich (White Dragon); C. Heigham, Ipswich (Blue Dragon); W. Loveday (Yellow Barbs).

RABBITS.

LOP-EARED.—*Back or Doe*.—1, Mrs. H. Pickworth, Spalding. 2, G. F. Twite, Cambridge. 3 and vhc, W. S. Ward, Cambridge.

ANY OTHER VARIETY.—*Back or Doe*.—1, J. N. Parsley, Cambridge (Silver-Grey). 2, G. C. Livett (Himalayan). 3, E. Everett, Cottenham (Belgian Hare), hc, T. Turner, Cambridge (Silver-Grey); G. C. Livett (Himalayan); E. Robinson, Kettering.

CAGE BIRDS.

CANARIES.—*Clear Yellow or Buff*.—1 and 2, R. Nixon, Cambridge. hc, F. R. Hall, Cambridge; Knight & Spencer, Hitchin. c, A. Morgan, Cambridge.

CANARIES.—*Any other variety*.—1, F. R. Hall. 2, R. Nixon. c, F. R. Hall; Knight & Spencer.

BRITISH SONG BIRDS.—*Any variety*.—1, M. Harle, Cambridge (Blackbird). 2, Knight & Spencer (Goldfinch). c, F. R. Hall (Goldfinch); Mrs. J. Mouel, Cambridge (Bullfinch).

OPEN PRIZES.

Cup for the greatest number of points in poultry classes.—M. Leno.

Cup for the best pen of poultry.—M. Leno.

Cup for the best pair of Pigeons.—W. Minson.

Cup for the best Rabbit, Mrs. H. Pickworth.

LOCAL PRIZES.

Cup for the greatest number of points in poultry classes.—W. Mansfield.

Cup for the greatest number of points in Pigeons and Rabbits.—G. Mann.

Cup for the best Rabbit.—G. F. Twite.

Cup for the best pen of Pigeons exhibited by a member.—G. Mann.

JUDGES.—*Poultry and Rabbits*: Mr. W. J. Nicholls and Mr. F. R. Hall. *Pigeons*: Mr. F. W. Maccalfe. *Singing Birds*: Mr. E. Tyler, jun.

WATFORD POULTRY SHOW.

THE annual poultry Show in connection with the West Herts Agricultural Society was held at Watford on Monday and Tuesday December 14th and 15th. The building, which has only been erected within the last few years, is admirably adapted for the purpose. No less than six five-guinea cups were offered by the local gentry or the Society for the best birds in the various classes; as, however, the area of the Society is confined to the

county of Herts and a limited radius round Watford, the competition is not of course so severe as in most of the open shows. The entries on this occasion were said to be in excess of the previous years, particularly in the Selling classes. They would probably be increased if the rules did not require a cock and two hens to be entered in one pen; it surely would be better to have a pair of hens in one class, and the cock in another.

The *Dorkings* were not very numerous, the cup going to some old birds belonging to the Rev. E. Bartrum, quite of the old style in point of size, but not quite of the colour now in fashion. His second-prize pen contained a pair of excellent pullets, dark in colour, of large size, and good in every respect; the cockerel, which was said to have won a cup a few days previously at Dorking, was good in comb and tail, but not so broad as the old bird. The *Cochins* were not as numerous as the *Brahmas*; here, as elsewhere, the *Light* are beginning to encroach on the *Dark* variety. There was rather a large class of *Creve-Coeurs* and *Houdans*, and the *Turkeys* formed one of the best classes in the Show. The attendance on the second day was very good.

DORKINGS.—Coloured.—Cup, 1, and 2, Rev. E. Bartrum, Berkhamstead. *White or Silver*.—1, C. Snelling, Holywell, Watford. 2, D. Carnegie, Eastbury, Watford.

COCHINS.—Partridge.—1, C. A. Barnes, Rickmansworth. 2, Lord Chesham, Latimer, Chesham. *Any other variety*.—1, C. A. Barnes. 2, R. Bedford, Great Berkhamstead.

BRAHMA POUTRAS.—*Dark*.—1 and Cup, W. A. Peel, Watford. 2, W. J. Jervis, Woodridings, Finsbury. *Light*.—1, Lord Chesham. 2, G. Bentley, Rickmansworth.

GAME.—1 and 2, G. Bentley.

HAMBURGERS.—*Gold*.—1, R. Blackwell, Chipperfield. 2, Miss Gee, Abbot's Langley. *Silver*.—1, P. Clatterbuck, Rickmansworth. 2, W. J. Loyd, Langleybury, Watford.

BANTAMS.—*Game*.—1, G. Bentley. 2, Lord Chesham. *Any other variety*.—1, W. J. Loyd. 2, Lord Chesham.

CREVE-COEURS AND HOUDANS.—1, W. A. Peel. 2, A. Godson, Barnet. **ANY OTHER BREED.**—1, A. Ward, Wimpole Street, London (Leghorns). 2, G. Bentley (Spanish).

ANY BREED.—*Hens*.—1, R. Horsfall, Watford. 3, R. Bedford. *hc*, Rev. E. Bartrum. *Cock*.—1, Rev. E. Bartrum. 2, Lord Chesham.

DUCKS.—*Aylesbury*.—1 and Cup, C. A. Barnes. 2, Lord Chesham. *Rouen*.—1, C. A. Barnes. 2, P. Clatterbuck. *hc*, Rev. E. Bartrum. *East Indian*.—2, G. Bentley. *Any other distinct breed*.—2, P. Clatterbuck.

GESE.—1 and 2, J. Thurlham, Hemel Hempstead.

TURKEYS.—Cup, 1, and 2, A. H. Longman, Shendish, Hemel Hempstead.

Mr. J. Dixon acted as Judge.

GUILDFORD POULTRY SHOW.

THE Surrey Agricultural Show was held at Guildford on the 15th inst. The poultry were shown in a spacious hall well lighted from above, and were arranged in double tiers of zinc pens all round it. Considering the birds were all from Surrey or parts of the neighbouring counties, the Show was a most excellent one. The *Dorking* classes, as might be expected, were of great merit, and, if we mistake not, some Crystal Palace and Birmingham winners had to be content with simple high commendations. All four varieties of *Dorkings* had classes, and each was well represented. The second-prize pairs of *Whites* attracted much attention from their exquisite condition and colour. The first-prize pair of *Cuckoos* were good in colour but small, and the absence of sickle feathers in the cock should, in our opinion, have placed them below two of Mr. Measenger's pens. *Spanish* were not good beyond the first-prize pair. In *Cochins* the first-prize *Buffs* were fair. The first-prize *Whites* good in shape, and beautifully shown. A nice pair of Grouse-feathered birds were unfortunately entered as *Dark Brahmas*. In both classes for *Brahmas* the prize birds were good, but few other birds in them were worth notice. The *Game* classes were very good, that for *Reds* well filled. First were beautiful *Brown Reds*; second *Black Reds*. In the other class a pretty pair of the now rare *Blue Game* won. There were some lovely *Golden-pencilled Hamburgs*, and as good *Game Bantams* as are seen at the best shows, the two winning cocks being peculiarly stylish. *Ducks* were fair. The second-prize pair of *Aylesburys* were nice in colour and size, and some quaint little *Shovellers* appeared in the Variety class. *Geese* and *Turkeys* were not so good as we have before seen at Guildford, and hardly worthy of so agricultural a county.

The general management of the Show seemed fair—that is, as good as is generally the case where a poultry show is but the adjunct of a cattle show. We may suggest to the authorities that canvas backs are necessary for zinc pens where these are placed some distance from the wall. We saw a handsome sickle tail destroyed by a shy cock being driven to the back of his pen by admiring gazers. If two or three open Selling classes were another year added to the Show, it might, we think, be made a great success, and a useful impetus given to poultry-breeding in the neighbourhood.

DORKINGS.—*Grey*.—1, O. E. Cresswell, Early Wood, Bagshot. 2, H. Young, Dorking. 3, J. Ivery & Son, Dorking. *hc*, H. Mills, Dorking. *Chickens*.—1, Mrs. F. Stevens. 2, A. Taylor, Dorking. 3, O. E. Cresswell. *hc*, C. Fennell, Oatlands Park. H. Mills, Dorking. *c*, J. Ivery & Son; J. H. Putney, Dorking.

DORKINGS.—*Silver-Grey*.—1 and *hc*, O. E. Cresswell. 2 and *c*, T. Moore, Petersfield. *White*.—1 and *hc*, O. E. Cresswell. 2 and *c*, G. Chubb, Denbies, Dorking. *Blue*.—1, J. Putney. 2, W. Messenger, Womersley. *hc*, W. Virgo and Son. *c*, W. Virgo & Son; W. Messenger; J. Isard, Wokingham Station.

SPANISH.—1, H. Brown, Putney Heath. 2, W. D. Frosser, Wandsworth.

COCHINS.—*Buff and Cinnamon*.—1, J. Pares, Postford. 2, Mrs. R. Bonner. *Any other colour*.—1 and 2, O. E. Cresswell.

BRAHMAS.—*Dark*.—1 and 2, O. E. Cresswell. *Light*.—1 and 2, J. Bradshaw, Cranleigh. *hc*, Rev. W. Pearce, West Horsley.

DUCKS.—*Aylesbury*.—1 and 2, Rev. W. Pearce, West Horsley. 2, Rev. J. Merriman, Cranleigh. *hc*, Rev. J. Merriman; J. E. Lane. *c*, E. Haines, Oatlands Park. *Any other variety*.—1, W. Balchin, Farnham.

HAMBURGERS.—1 and 2, O. E. Cresswell. *hc*, W. Balchin; W. O. Hodges. *c*, G. Lee, Ashford.

BANTAMS.—*Game*.—1, T. Randall, jun. 2, T. W. Anns, Clapham. *hc*, J. E. Lane. *c*, W. M. Molyneux; T. Randall, jun. (2). *Any other variety*.—1, O. E. Cresswell. 2, J. Pares, Postford. *c*, W. Balchin.

DUCKS.—*Aylesbury*.—1 and 2, Rev. W. Pearce, West Horsley. *c*, E. Hilder, Woking. *Rouen*.—1, E. Hilder. 2, J. Pares. *Any other variety*.—1, R. Wilkinson, Guildford. 2, J. H. Webber, Womersley. *hc*, G. Lee, Ashford.

GESE.—1, W. Messenger. 2, E. Hilder. *hc*, T. Baker, Compton. *Goslings*.—1, W. Messenger. 2, T. Baker. *hc*, W. S. Smith. *c*, W. Virgo & Son.

TURKEYS.—1, Rev. N. J. Bidley, Newbury. 2, G. H. Langford. *hc*, Countess Lovelace, East Horsley. *c*, W. Messenger. *Fowls*.—1, G. H. Langford. 2, J. H. Webber, Womersley. *hc*, G. H. Finkler. *c*, Countess Lovelace.

ANY OTHER VARIETY.—1, Rev. G. Chilton (Creve-Coeur). 2, O. E. Cresswell (Japanese Silkies). *c*, W. O. Hodges (Golden Polish); R. Wilkinson (Japanese Silkies).

JUDGE.—Mr. P. H. Jones, Fulham.

PLYMOUTH POULTRY SHOW.

THIS Show was held in the Market, Plymouth, on the 15th, 16th, and 17th of December, when the following awards were made:—

GAME.—*Any variety*.—Cup and 1, H. Brown, St. Austell. 2, N. Barter, Plymouth. *Black or Brown Red*.—1 and 2, H. Brown. *Any other variety*.—1, H. Browne. 2, G. Julian, Wadebridge. *Indian*.—Cup and 3, Mrs. J. Partridge, Bow, Devon. 2, J. Palmer, Launceston.

DORKINGS.—*Coloured*.—1 and 2, R. W. Beachey, Kingskerswell. *Silver-Grey or White*.—1, H. Matthews. 2, J. H. Nicholls, Lostwithiel.

COCHINS.—*Buff and Cinnamon*.—1, S. R. Harris, Casgarne, St. Day. 2, H. Tuckwell, St. Austell. 3, G. Lias, Par Station, Cornwall. 2, Hon. Mrs. Sugden, Wilts, Somerset. *White*.—1 and Cup, T. H. Waterman, Devonport. 2, R. S. S. Woodgate, Pembury, Tunbridge Wells.

BRAHMAS.—*Light*.—1 and Cup, J. H. Nicholls. 2, J. Bassett, Lostwithiel. *Dark*.—1, T. H. Waterman. 2, T. Start, Calstock Town.

SPANISH.—1, J. Bassett. 2, Ellis & Parsley, Bristol.

MINORCA.—*Red-faced*.—1, H. J. Lonnnon, Stoke Devonport. 2, J. Croote, jnr., Wellington.

HOUDANS.—1, W. H. Copplestone, Lostwithiel. 2, H. Feast, Swanses.

CREVE-COEUR.—1, H. Browne. 2, W. H. Copplestone.

HAMBURGERS.—*Gold-pencilled*.—1, S. Elliott, jun., Liskeard. 2, H. Feast.

Silver-pencilled.—Cup, 1, and 2, N. Barter.

HAMBURGERS.—*Gold-spangled*.—1, N. Barter. 2, Mrs. J. Pattison, Dorchester.

Silver-spangled.—1, S. Elliott, jun. 2, N. Barter.

BANTAMS.—*Game*.—1, Allen & Osborn, Plymouth. 2, Master R. Clogg, Dublin. *Any other variety*.—1, C. Reed, Cambridge. 2, Rev. G. F. Hodson, Bridgewater.

ANY OTHER VARIETY.—1, J. Isard, Wokingham. 2, G. Lias.

SELLING CLASS.—*Cock*.—1, H. Brown. 2, J. Bassett. 3, H. J. Lonnnon.

DUCKS.—*Aylesbury*.—1 and 2, S. R. Harris. *Rouen*.—1, W. H. Copplestone.

2, H. Browne.

GESE.—1, S. Lane, Stratton. 2, Mrs. J. Partridge. 3, F. C. Ford, Plympton.

TURKEYS.—1, Rev. N. J. Ridley, Newbury. 2, F. C. Ford, Plympton.

PIGEONS.

CARRIERS.—1, P. Goss, Plymouth. 2, F. Hayman, Exeter.

CARRIERS.—1, N. Barter. 2, F. Hayman.

POUTERS.—1, J. Broad, Plymouth. 2, H. Yardley, Birmingham.

BARBS.—1, J. D. Mole, Exeter. 2, H. Yardley.

TUMBLERS.—1, J. Broad. 2, R. Wines, St. James, Devon.

FANTAILS.—1, J. F. Loversidge, Newark. 2, A. A. Vander Meersch, Tooting, London.

OWLS.—1, F. Braund, Bideford. 2, J. L. Smith, Barnstable.

TERTSITS.—1 and 2, J. L. Smith.

ANTWERPS.—1, G. Colson, Exeter. 2, W. Moon, Plymouth.

TRUMPETERS.—1 and 2, A. A. Vander Meersch.

DRAGONS.—1, Rev. G. F. Hodson. 2, W. Moon.

ANY OTHER VARIETY.—1, G. H. Gregory, Taunton. 2, A. A. Vander Meersch.

JUDGE.—J. Dixon, Esq., Bradford, Yorkshire.

LONDONDERRY POULTRY SHOW.

THIS was held on the 15th and 16th inst. Occurring just after the Show at Belfast, the Londonderry Society were fortunate in securing entries from our English exhibitors who had birds at the first-named Show, and the consequence was that the entries were better and the quality superior to some previous shows.

Dark Brahmas headed the list. First and second were grand hens with good cocks. Light were first good, and second moderate; and in chickens *Light* won both prizes. *Spanish* were good, as also the *Cochins*, where *White* were first in old, and *Partridge* first in chickens. *French* were good classes. Of *Hamburgs* there were only four pens. *Bantams*, *Game*, were fair birds, the first-prize *Piles* containing a grand hen; and *Blacks* won both prizes in the Variety class of *Bantams*. *Geese* were excellent, and the *Ducks*, especially the *Rouen*, above an average; first very large, and grandly marked. In the Variety were *Ruddy Shiels*, *Common Shiels*, and *Black East Indian*.

In *Pigeons* the *Carriers* and *Barbs* were first-rate, and *Fantails* good. The first in the Variety class, an English *Silver Owl*, was a good stout bird.

We can congratulate our Londonderry friends upon their success, and should be glad to see an attempt calculated to bring yet better and more numerous entries.

BRAHMAS.—*Dark*.—1 and 2, W. H. Crabtree, Levenshulme, Manchester. *hc*, J. Stuart, Helensburgh. *hc*, T. M. Hillard, Dublin. *c*, C. A. Smyth, Derry.

Light.—1, W. H. Crabtree. 2, J. Forrest, Milltown. *hc*, G. A. Stephens, Dublin.

BRAHMAS.—*Dark or Light*.—(*Chickens*).—1, E. J. Poer, Limerick. 2, D. Sullivan. *hc*, E. T. Herdman, Strabane (2); H. J. McBride, Gilford; R. F. Williams, Clontarf; R. A. MacDonald, Derry; C. A. Smyth; J. Forrest; Miss De C. Drevier, Dublin.

DORKINGS.—1, W. Whitworth, jun., Manchester. 2, J. Bond. *hc*, R. P.

Williams. *Chickens*.—1, A. W. Smyth, Castrase. 2, W. G. Molligan, Belfast. *he*, S. Glenn, Derry.

SPANISH.—1, J. A. & M. F. Smyth, Derry. 2, R. P. Williams. *Chickens*.—1, J. A. & M. F. Smyth. 2, W. G. Molligan. *he*, R. A. MacDonald. *Cochins*.—1, W. Whitworth, jun. 2, T. A. Bond. *he*, W. G. Molligan; W. H. Crabtree; F. Robertson, Belfast. *Chickens*.—1 and 2, M. Mahony, Dublin. *he*, L. Stoney, Dublin; F. Robertson. *c*, R. A. MacDonald; D. Sullivan. *FANCIERS*.—1, W. Whitworth, jun. 2, W. H. Crabtree. *he*, G. W. Hibbert, Manchester; Miss L. D. Smyth, Derry. *he*, E. T. Herdman; S. M. Moore, Derry; G. A. Stephens. *Chickens*.—1, R. A. MacDonald. 2, E. T. Herdman. *he*, Miss L. D. Smyth; G. W. Hibbert; S. M. Moore. *GAME*.—1 and 2, E. J. Peor. *he*, J. M. Millan, Coleraine; J. Logan, Derry. *HAMBURGS*.—Pencilled.—1 and 2, R. A. MacDonald. *Spangled*.—1, L. Stoney. *BANTAMS*.—*Game*.—1, J. Corcoran, jun. 2, *he*, and *he*, J. Corcoran, jun. *Any other variety*.—1, T. M. Hillard. 2, R. H. Ashton, Manchester. *he*, G. A. Stephens. *he*, A. Corcoran.

POLISH.—1, R. P. Williams. *ANY OTHER VARIETY*.—1, Miss L. D. Smyth (Black Hamburgs). 2, H. J. McBride (Malays). *he*, J. M. Millan (Malays).

SELLING CLASS—Hens or Ducks.—1, R. P. Williams (Dorkings). 2, E. T. Herdman. *he*, E. T. Herdman; J. Bond (Rouen). *he*, J. Bond (Dark Brahmans); R. A. MacDonald (Black Cochins); W. G. Molligan; Miss De C. Drevar (Silver Dorkings). *c*, E. T. Herdman; M. Mahony (Cochins); W. G. Molligan.

SELLING CLASS—Cock or Drake.—1, R. A. MacDonald (White Cochins). 2, M. Mahony (Cochins). *he*, E. T. Herdman; R. A. MacDonald (Sultan). *he*, J. Bond (Rouen); M. Mahony (Cochins); W. Simpson, Derry (Aylesbury); R. A. MacDonald (Spanish). *c*, J. Bond (Rouen); R. A. MacDonald (Light Brahma).

TUACERS.—1, H. Lytle. 2, W. Simpson. *he*, W. Simpson; C. A. Smyth. *DUCKS*.—*Rouen*.—1, F. Robertson. 2, W. Simpson. *he*, J. Bond; R. P. Williams; T. H. Graham, Derry; D. M. Smyth, Derry; W. Whitworth, jun. *Aylesbury*.—1, M. F. Smyth. 2, W. Simpson. *he*, R. P. Williams; S. M. Moore; M. F. Smyth. *Any other variety*.—1 and *he*, R. P. Williams. 2, G. S. Sainbury, Derry; *c*, J. Bond (Crested); R. H. McCorkell, Derry.

GEESSE.—1, T. H. Graham. 2, R. P. Williams. *he*, W. Simpson; S. M. Moore (2); C. A. Smyth. *c*, G. Mackey, Derry.

PIGEONS.

CARRIERS—Cock or Hen.—1 and 2, W. A. P. Montgomery, Belfast. *POUTERS—Cock or Hen*.—1 and 2, F. W. Zurborst. *he*, T. H. Graham.

BARBS—Cock or Hen.—1 and 2, W. A. P. Montgomery. *FANTAILS—Cock or Hen*.—1, A. Corcoran. 2, E. A. Seale, Dublin. *he*, A. Corcoran; E. A. Seale, Dublin.

JACOBIANS—Cock or Hen.—1, F. W. Zurborst. 2 and *c*, W. Shean, Comber. *he*, J. M. Aplin, Belfast; E. A. Seale (2).

TRUMPETERS—Cock or Hen.—1 and 2, J. Frame, Comber. *he*, W. A. P. Montgomery. *he*, F. W. Zurborst.

TURBITS—Cock or Hen.—1, E. A. Seale. 2, W. G. Henry, Dublin. *DRAGOONS—Cock or Hen*.—1, W. G. Henry. 2, T. M. Hillard.

ANY OTHER VARIETY—Cock or Hen.—1, W. G. Henry (English Owl). 2, F. W. Zurborst (Silver). *he*, W. A. P. Montgomery (Owl); E. A. Seale. *c*, A. Corcoran (Nun).

SELLING CLASS—Pairs.—1 and 2, E. A. Seale (Jacobins). *he*, A. Corcoran (Fantails and Trumpeters); F. W. Zurborst (Jacobins).

CAGE BIRDS.

CANARY—Buff or Pale Yellow—Cock or Hen.—1, A. A. Hamilton. 2, J. McIntyre, Derry. *he*, J. Park, Derry; J. & W. Stitt, Belfast; J. C. & A. Corcoran, Derry.

CANARY—Dark Yellow or Jonque—Cock or Hen.—1, C. A. Smyth. 2, A. A. Hamilton; J. McIntyre; J. C. & A. Corcoran. *c*, A. A. Hamilton; J. & W. Stitt (2).

CANARY—Any other colour or kind—Cock or Hen.—1 and 2, M. F. Smyth. *he*, A. A. Hamilton; J. & W. Stitt. *c*, A. A. Hamilton; W. Dale, Derry; J. C. & A. Corcoran.

CANARY—Any colour—Young Cock or Hen.—1, J. McIntyre. 2, J. & W. Stitt. *he*, J. C. & A. Corcoran. *he*, J. C. & A. Corcoran; F. Smyth. *c*, A. A. Hamilton; W. K. Magill, Waterside.

MULES—Cock or Hen.—1, W. K. Magill. 2, A. A. Hamilton, Derry. *he*, A. Corcoran, Belfast. *c*, J. Armstrong, Derry.

BATISB BIRD.—1 and 2, M. F. Smyth, Derry. *c*, J. Corcoran, jun., Derry; H. S. Hamilton, Derry.

PARROT, PARAKEET, COCKATOO, OR LARGE FOREIGN BIRD.—1, Miss Corcoran, Derry. 2 and *he*, J. Corcoran, jun. *c*, J. Corcoran, jun.; J. W. Corbett, Derry.

SMALL FOREIGN BIRDS—Pair.—1, 2, and *he*, M. F. Smyth.

JUDGE.—Mr. C. F. Staunton, Sandy Mount, Dublin.

KIRKCUDBRIGHTSHIRE POULTRY SHOW.

The annual Show of the Kirkcudbrightshire Society was held at Castle-Douglas on the 18th inst. Like all its predecessors, its great fault was that the exhibitors were obliged to find their own coops—an antiquated system which does much to retard the usefulness of the Show, and one we would gladly see abolished, for then the entries, especially from a distance, would no doubt be much larger. The Town Hall is an excellent place for such an exhibition, being well lighted and lofty.

Game headed the list, Black Reds winning first in both classes, and Brown Reds second in old birds. Duckwings were very good in colour, but only small in bone. Dorkings were next, the Dark Greys only poor and few, but the Silver-Greys good in both classes. Spanish were poor; but the Cochins in both young and old mustered well, the winners being unusually good in colour. Hamburgs were a great improvement upon all previous shows, some birds being unusually good. Brahmans were a good lot, the winners in old being same as at Dumfries; but the chickens were reversed, the first-prize cockerel having made great progress. The Variety class contained good birds of several kinds, the first Hondans, very good; Crève-Cœurs being second. Bantams were poor, except the winners in Game, and these were good, especially the Duckwings. Ducks, both Aylesbury and Rouen, especially the former, were first-class in all respects, and Geese and Turkeys very large.

The Pigeons contained nothing of note except the first-prize Pouters, Black Balbs, and Fantails.

The show of Birds was mostly of the Scotch Fancy, but there was a good show of Goldfinches.

Game.—Black Reds, Blacks, and other Reds and Blues.—1, R. Bryden, Lochmaben. 2, J. A. Mather, Nuthside, Closeburn. *he*, A. M'Adam, Castle-Douglas. *he*, Miss E. A. Knott, Dumfries. *Chickens*.—1, R. Bryden. 2, J. Craik, Dumfries. *he*, W. Waller, Castle-Douglas. *c*, W. Waller; A. M'Adam (2).

GAME—Duckwings, Whites, and other Greys.—1, J. Craik. 2 and *he*, A. M'Adam. *Chickens*.—1, A. M'Adam. 2, J. M'Ghie, Castle-Douglas. *he*, J. A. Mather; J. Craik.

DORKING—Coloured.—1, N. Wilson. *DORKINGS—Silver-Greys*.—1, J. Cunningham. 2, Capt. G. F. Lyons, Kirkmichael. *he*, Mrs. Congreve. *Chickens*.—1, 2, and *he*, J. Cunningham. *he*, Capt. Maxwell, Terregles; Capt. G. F. Lyons.

SPANISH—Black.—1, J. M'Harrie, Culhorn Mains, Stranraer. 2, J. Ross, Lochans, Stranraer. *c*, J. Spence, Low Ardwell, Stranraer. *he*, A. Wither, Stranraer. *Chickens*.—1, W. Martin, Stranraer. 2 and *he*, J. M'Harrie. *he*, J. Spence; A. Wither. *c*, P. Matthews, Garthland Mains, Lochans; P. McIntyre, Castle-Douglas.

COCHIN-CHINAS.—1, A. Hutchison, Stranraer. 2 and *he*, G. F. Lyons. *he*, Miss E. A. Knott; T. Kennedy, Dumfries. *c*, R. Maxwell, Dumfries. *Chickens*.—1, R. Maxwell. 2, J. M'Harrie. *he*, Capt. Maxwell; T. Kennedy; Capt. G. F. Lyons (2).

HAMBURGS—Golden-spangled.—1, A. Wither. *Silver-spangled*.—1, J. Ross. 2 and *he*, A. Wither. *he*, Capt. G. F. Lyons.

HAMBURGS—Golden-pencilled.—1, G. M'Dowall, Anechtalre. 2, J. Ross. *he*, Master J. Kerr; T. Kennedy; A. Hutchison. *c*, Capt. G. F. Lyons. *Silver-pencilled*.—1, W. M'Harrie. 2, M. Smith, Townhead.

BRAMA POUTAS.—1, R. Maxwell. *he*, Capt. G. F. Lyons. *c*, G. W. Congreve, Carlingwark. *Chickens*.—1, R. Maxwell. 2, Capt. G. F. Lyons. *he*, T. Kennedy; R. J. Congreve. *c*, Miss E. A. Knott.

ANY OTHER VARIETY.—1, A. Wither (Hondans). 2, Capt. Maxwell (Crève-Cœurs). *he*, J. Ross (Black Hamburg); J. C. Kennedy (White Dorkings); W. M'Harrie (Silver Poland); *he*, Miss E. A. Knott (Polands); A. Wylie, Johnstone (Polands); W. M'Harrie (Crève-Cœurs).

SELLING CLASS.—1, T. Kennedy (Black Cochins). 2, Capt. G. F. Lyons (Cochins). *he*, — Irving, Kirkhouse, Carlisle (Game); P. McIntyre (Spanish). *he*, Miss E. A. Knott (Polands); J. Ross (Dark Brahmans); N. Wilson (Brahmas); W. Hogg, Castle-Douglas (Dorkings); W. Martin; W. M'Harrie (Polands). *c*, W. Martin.

DUCKS—Aylesbury.—1 and 2, Capt. G. F. Lyons. *he*, Mrs. W. Brown, Castle Douglas. *c*, Mrs. Black; Mrs. W. Brown. *Rouen*.—1, G. M'Dowall. 2, W. Martin. *he*, Capt. G. F. Lyons. *he*, B. Carlisle, Dumfries; Capt. Maxwell; G. M'Dowall. *Any other variety*.—1, W. Martin (Carolina). 2, J. C. Kennedy (Wild). *c*, W. Buchanan, Bonknowe (2); Miss E. A. Knott; G. W. Congreve; Capt. G. F. Lyons.

GEESSE.—1 and 2, J. Bell, Dunlop.

TURBETS.—1, M. H. Maxwell, Dumfries. 2, J. Bell. *he*, Mrs. Congreve. *c*, E. Forsyth, Hensol.

BANTAMS—Golden and Silver-laced.—1, R. Bryden. *Black*.—1, D. M'Glen, Kilmarnock. 2, R. Bryden. *c*, Miss E. A. Knott. *White*.—1, J. Geddes, Dalbeattie. 2, Capt. Maxwell.

GAME BANTAMS—Black and other Reds.—1, J. Mair, Lochmaben. 2, J. Morrison, Drumstinchall. *he*, Miss N. Mackie, Errespie; C. Mitchell, Castle-Douglas; W. Waller, Castle-Douglas. *c*, J. M'Keand, Kilmichael. *Duckwings and other Greys*.—1, R. J. Hartley, Altrincham, Cheshire. 2, D. M'Glen. *c*, N. Wilson; R. Irving.

PIGEONS.

TUMBLERS.—1, R. Hutchison. 2, J. Turner, jun., Dumfries. *c*, E. M'Kie, Maxwelltown; J. Kilgour, Stranraer.

CARRIERS.—1, A. Hutchison. 2, Miss E. A. Knott.

POUTERS.—1 and 2, A. Hutchison.

JACOBIANS.—1, J. Turner, jun. 2, Miss E. A. Knott. *he*, E. M'Kie.

FANTAILS.—1 and *he*, T. Douglas, Thornhill. 2, Miss E. A. Knott.

ANY OTHER VARIETY.—1, A. Hutchison (Trumpeters). 2, Master W. Patullo, Parton Manse (Ice). *he*, Miss E. A. Knott (Archangels). *c*, E. M'Kie (Barbs). A. Hutchison, jun. (Blue Turbites).

CANARIES.

YELLOW—Cock.—1, J. Thorpe, Dumfries. 2, R. Bryden, Lochmaben; J. Thorpe.

BUFF—Cock.—1, W. Clark, Langholm. 2, T. Grierson, Castle-Douglas. 3, J. Thorpe. *Hen*.—1 and 2, J. Thorpe. 3, W. J. Torry, Castle-Douglas.

YELLOW PEBBLED—Cock.—1, J. Thorpe. 2, J. M'Quhae, Maxwelltown. 3, J. M'Crede, Stranraer. *Hen*.—1, W. Clark. 2, J. M'Crede. 3, T. Grierson.

BUFF PEBBLED—Cock.—1, H. Eiden. 2, J. Thorpe. 3, J. M'Crede. *Hen*.—1, E. Forsyth, Hensol. 2 and 3, T. Gilmore, Newton-Stewart.

GOLDEN PEBBLED—Cock.—1, J. Thorpe. 2, A. Martin, Castle-Douglas. 3, Master J. Little, Dumfries.

GOLDFINCHES.—1 and 2, A. Martin. 3, J. Ireland, Campbellton.

JUDGE.—Poultry and Pigeons: Mr. E. Hatton.

GREAT YARMOUTH POULTRY SHOW.

This Show was held on the 16th and 17th inst. in the Rifle Drill Hall, an excellent place in all respects, except that, the light being wholly from the roof, some of the pens on the bottom tier were rather deficient of light. A very excellent list of cups and money prizes brought together a good entry of excellent birds.

Brahmas headed the list, some grand old cocks being shown, as also in hens, Mr. Lingwood taking most of the prizes; some of the local birds coming very close upon the winners. *Dorkings* were also good, most of the prizes being won by Dark birds, though in hens we preferred a Silver-Grey by Mr. Wren to the winners. *Chickens* were poor. Light Brahmans were a nice lot in all classes. In *Cochins* the awards were well made; and in *Game* there was little to take exception to, except that Mr. Martin's grand Duckwing was passed unnoticed, and should have been second, if not higher. *Spanish* were well judged except the second-prize cock, and this ought not to have been noticed, its face being rough and puckered to a great extent. *Hamburgs* were a fair lot in all classes, but the Blacks were by far the best. A class for *Malays* brought a good entry, and we hope this will be copied by other societies; but we were not greatly impressed with the quality of the birds. *Game Bantams* were large classes, and here we are sorry to have to record about the worst piece of judgment we have ever seen. In Black Reds the first contained a very moderate pullet and a cockerel that would be dear at 1s. 6d., as it had not a single point; wings long and down, and tail gone star-gazing. Second were much better, being sound in colour but heavy in feather, and should have been highly commended. Pen 415 (Eaton) were second best, and 450 third best; but the best of all, 448, by G. Hall, a pen worth the whole class, and which ought to have taken the cup at a look, were placed third. In the case of the next class the awards

were even worse made if possible. Pen 463 (which we do not hesitate to say are faultless, and one of the best pen of Piles ever yet shown), were not even commended, while the cup was given to Piles without either style or condition to recommend them, and quite a washed-out colour. Pen 451 (Adams), Duck-wings, third, should have been second, and Mr. Entwistle's highly commended pen third. Surely the Judge must be devoid of practical experience to make such a mess; and there is little doubt but that a few more mistakes and the fancy will lose some of its best supporters. The Black Bantams were rightly placed. Ducks were very good classes; as also the Selling classes, of which there were several provided, and they were well filled. The pens were the property of the Society, and were of the most substantial kind, clean, and well lit up.

The Pigeons had the same amount in prizes offered as last year, and the entries were about the same, but a great improvement was very plain in the quality of the birds, and that mostly in the standard varieties. In Carrier cocks the first was a heavy bird, but a little bright in eye as compared with the second-prize Dun, and a trifle peg-wattled. The Dun, a strong young bird, was a little stumpy in beak; third a Black, a little flat-wattled, good eye, carriage, and colour. In hens first was a grand bird, fine in every point, and splendid in carriage and colour, and the cup for the best pen was awarded here; second, also a Black, was good, but lighter; and third a good sound Dun. Carriers of 1874 were a grand lot, and very regular: first a large strong Dun cock; second a Black hen, which must make her mark on the fancy; and third a strong young Blue. Twenty-three entries. *Pouter* cocks good. First large Blue, very good in all points, and in fine play, but rather thick in girth; second White, more slim-built, also large and good; and third a White. In hens first was a grand White in the best possible order; second a good Yellow, rather foul on thigh, but in good order; and third also White. Most of the birds in the above five classes were mentioned in the list. *Barbs* were moderate: first a good Black; second Red, by far the best, but not in order; and third Black. *Barbs* of 1874 were good, the winners Black. *Tumblers*, Short-faces, a grand lot, among which we found some most perfect birds; the winners were all Almonds. First most perfect Almonds; second best in head, but rather dark in tail; and third good, but scarcely as well broken in feather. The best headed bird in the lot was an Agate, perhaps one of the best ever seen. *Tumblers*, Long, first a most perfect pair of Red Mottles; second of that kind, but not so even; and third Badges. *Fantails* were unusually good in both sexes, the tail being almost a complete circle, and in most cases combined with fine action, notably in the case of first-prize hen. *Dragoons* were good classes. In cocks a most perfect Yellow was placed first, this bird answering all the demands of the old-established fancy; second a good strong Blue, and third Silver; many others being noticed. In hens the first was also a Yellow, and a most perfect match for the cock above referred to; second Blue, fine and good in all points; and third Blue. Most were noticed. *Antwerp* cocks were a very fair lot. The first, a Silver Dun, was Short-faced, good in head, but a little too long in feather; second Red Chequer, a perfect medium-faced bird; and third a Short-faced Silver Dun. In hens the first was a most excellent Short-faced Dun, almost as strong as a cock in foot; second a Red Chequer; and third Silver Dun. *Jacobins* poor, and third prize withheld. The Variety class was a real good one, first were placed White African Owls; second Pigmy Pouters; and third Silver Brunswick; while an extra third was awarded to Spangled Ice. There were some good birds in the Selling class, the first going to White Pouters; second Ice Pigeons; and third to Almonds.

DORRINGS.—Cock.—Cup, H. Lingwood, Needham Market. 2, W. Clark, Nottingham. 3, Mrs. B. E. Sapwell, Aylsham. Local, W. Durrant, Yarmouth. *Hen*.—Cup, Henry Lingwood. 2, Rev. E. Bartrum, Eerkhamstead. 3, L. Wren, Lowestoft. 3, F. Parlett, Chelmsford; Mrs. Berners, Toxted; A. Darby, Shrewsbury; Mrs. Sapwell; Mrs. Atherton, Leighton Buzzard; J. Gee. c, Mrs. Berners; R. Gurney, Norwich; Henry Lingwood.

DORRINGS—Chickens.—1, C. J. N. Row, Melford. 2, J. Frost. 3, L. Wren. 4, L. Allen, Southwark, London. *he*, W. Howchin, Wangford. c, W. Howchin; H. H. Rush, Heybridge.

BRAHMAS.—*Park—Cock*.—Cup and 2, Horace Lingwood, Creeting. 3, Lady Gwydyr Ipswich. Local Cup, G. S. Pearson, Wymondham. *he*, G. S. Pearson. N. Brunton. c, J. S. Clark; F. J. Cotterell, Birmingham. *Hen*.—Cup, Horace Lingwood. 2 and 3, Lady Gwydyr. Local, G. S. Pearson. *he*, Horace Lingwood. *he*, T. L. Nash, Ipswich. Rev. J. D. Peake, Chertsey. c, G. S. Pearson; Rev. J. D. Peake. *Pullet*.—Cup, Newham & Mauby, Wolverhampton. 2, J. Wats, Birmingham. 3, White & Shutt, Wellingham. Local, G. S. Pearson. *he*, Rev. J. D. Peake. *he*, E. Frithard, Wolverhampton; Horace Lingwood (3); Mrs. C. Tindall; Newham & Mauby. c, Dr. J. Holmes, Chesham.

BRAHMA—Light.—Cock.—Cup and 2, Horace Lingwood. 3, P. Haines, Fulgrave, Diss. *he*, P. Haines; J. Long; F. J. Cotterell. c, K. Bird. *Hen*.—Cup, F. J. Cotterell. 3, S. P. Broad, Rengate. *he*, P. Haines; Mrs. Peet, Sharnbrook. *he*, P. Haines. *Pullet*.—Cup, A. Darby, Bury St. Edmunds. 2, S. P. Broad. 3, Horace Lingwood. *he*, P. Haines; K. Bird. *he*, Mrs. Peet; J. Long; R. Bird; H. Stephens.

COCHINS—Crown or Buff—Cock.—Cup, Lady Gwydyr. 2, A. Darby. 3, c, Mrs. A. Tindall. Local, W. P. Matthews, Glaston. *he*, H. Piper, Oxford; R. A. Burnell. *Hen*.—Cup, A. Darby. 2, Lady Gwydyr. 3, Mrs. A. Tindall. Local, W. P. Matthews. *he*, Mrs. C. Berners; Mrs. A. Tindall; Henry Lingwood. c, T. Sherwood, Needham Market.

COCHINS—Partridge.—Cock.—Cup, Mrs. A. Tindall. 2, T. M. Derry, Gedney. 3, J. Gunn, Colville. *he*, W. Clark; Bentinck, Cambridge; G. Shrimpton, Leighton Buzzard. c, T. J. Saltmarsh, Chelmsford. *Hen*.—Cup, Mrs. A. Tindall. 2, T. M. Derry. 3, G. Shrimpton. Local, W. Durrant. *he*, G. Vincent, Norwich; W. Durrant (2).

COCHINS—Black.—Cup, W. Mansfield. 2, Lady Gwydyr. 3, T. Aspend. *he*, A. Darby.

COCHINS—White.—Cup, R. S. S. Woodgate, Tunbridge Wells. 2, Mrs. A. Tindall. 3, J. K. Fowler, Aylesbury. *he*, R. S. S. Woodgate; Mrs. A. Tindall; W. A. Burnell.

SPANISH—Cock.—Cup, J. Boulton. 2 and Local Cup, E. Holmes. 3, R. Newbitt, Epworth. *he*, J. Keable. *Hen*.—Cup and 2, J. Palmer, Acton, London. 3, R. Newbitt. *he*, M. Brown, Melton Mowbray. c, Major C. J. Ewen, Norwich. *GAME—Black-breasted.*—Cock.—Cup, J. Forsyth, Wolverhampton. 2, J. Mason, Worcester. 3, Capt. E. F. Terry, Reading. Local, W. Durrant. *he*, S. Forsyth, Stowmarket. c, Allen, Norwich. *Hen*.—Cup, S. Matthews. 2, J. Forsyth. 3, J. H. Bradwell, Southwell. *he*, G. H. Fitz-Herbert, Sevenoaks.

GAME—Brown-breasted.—Cock.—Cup, S. Matthews. 2, T. Burgess, Salop. 3, G. C. Barrett, Birkenhead. Local, W. Durrant. *he*, W. Durrant (2); G. Cottle; J. Carlisle, Earby. *Hen*.—Cup, Dr. A. Cameron, Rotherham. 2, H. E. Martin, Fakenham. 3, S. Matthews. Local, W. Durrant. *he*, H. Reynolds, Lowestoft; J. Cook; W. C. Phillips, Worcester. c, T. Burgess.

GAME—Any other variety.—Cock.—Cup, W. C. Phillips. 2, E. Bell, Barton-on-Sea. 3, G. H. Fitz-Herbert. c, B. Mollett, Hunstanton; W. Wright, Ormskirk. *Hen*.—Cup, E. Winwood, Worcester. 2, D. W. Thomas. 3, S. Matthews.

HAMBURGS.—*Silver-spangled.*—Cup, R. Stanworth, Worsbourn. 2, J. Long. 3 and Local, C. Quinton, Yarmouth. *he*, R. H. Platt, jun., Fakenham. c, J. Carr, Swansea. *Silver-pencilled.*—Cup, T. Webster, Colne. 2, H. Smith, Keighley. 3, J. Long. *he*, T. Haason, Keighley.

HAMBURGS.—*Gold-spangled.*—Cup, W. K. Tiekner, Ipswich. 3, J. Long. 3, S. W. Hallam. Local, E. Cox. *Gold-pencilled.*—Cup, W. K. Tiekner. 3, L. Wild, jun. 3, S. W. Hallam. Local, W. Brett. *he*, W. Driver; J. Long; S. T. Webster.

HAMBURGS.—*Black.*—Cup, J. Long. 2, H. Thomas. 3, Rev. W. Serjeantson, Acton Burnell Rectory. Local Cup and *he*, T. A. Wright. c, R. S. S. Woodgate. **AMERICAN FOWLS.**—1, A. Ward. 2, R. K. Fowler. 3, A. Kitchen, Westerham. *he*, R. K. Fowler; R. B. Day.

COCHINS.—Cup, J. Bailey, Newark. 2, W. Cotlack, jun., Littleport, Ely. 3, J. K. Fowler. *he*, R. A. Bousier, Fenshurst. c, G. D. Harrison.

MALAYS.—Cup, S. Elliott. 2, F. Sabine, Birmingham. 3, G. Burnell, Rugeley. *he*, J. S. Rooth; Capt. C. P. Terry.

ANY OTHER VARIETY.—Cup, W. Cotlack, jun. 2, J. Long. 3, Mrs. A. Tindall. *he*, H. Peat, Swansea. *he*, A. & W. H. Silvester, Sheffield; G. W. Boothby; Miss A. E. Eeles, Southwold; A. Darby; C. Broad; J. Dean, Keighley. c, R. A. Bousier.

GAME BANTAMS.—*Black or other Reds.*—Cock.—Cup, J. Terry. 2, W. B. Jefferies, Ipswich. 3, G. H. East, Local. c, S. Pearson. *he*, A. Slorans; W. Adams. Ipswich. *he*, F. W. H. Bradwell, Bradford; W. B. Jeffries; J. Eaton, Grantham; R. Newbitt; F. Shumach. *Any other variety.*—Cup, J. Eaton. 2, F. Shumach, Southwell. 3, W. Adams. *he*, G. Evans, Worcester; W. F. Entwistle.

BANTAMS.—*Black.*—Cup, Milner & Beaudan, Keighley. 2, J. Earnshaw, Rotherham. 3, Mrs. A. Tindall. Local, 1. Preston, jun., Yarmouth. *he*, C. B. Francis; A. Slorans; T. E. Thistle. c, K. H. Ashton, Mottram; G. Hall. *Any other variety except Game.*—Cup, E. Frithard. 2, R. S. S. Woodgate. 3, A. Ashley. Local, E. Cox. *Gold-spangled.* *he*, Mrs. Woodcock. *he*, Mrs. T. Longe; T. Fenn; Mrs. Tonkin. c, T. P. Carver.

DECKS.—*Iglesbury.*—1, J. K. Fowler. 2, Mrs. A. Tindall. 3, H. Hoff. *he*, W. B. Risling. *Rouen.*—1, J. K. Fowler. 2, J. S. Pearson. 3, F. Parlett, Chelmsford. *he*, J. Everett. c, Rev. W. F. Dixon; Lady G. Gordon. *Any other variety.*—1, A. & W. H. Silvester. 2, Mrs. Wilkison, Guildford. 3, G. S. Sainsbury, Devizes. *he*, J. W. Kelleway. c, T. L. Nash.

SELLING CLASS—Cock or Drake.—Cup, G. Keay, Birmingham. 2, Mrs. C. Berners. 3, W. White, Lowestoft. 4, T. L. Saltmarsh. *he*, H. E. Martin; E. G. Keay. *he*, Mrs. Peet; Rev. F. Tearle; T. Sherwood; W. J. Nutman; G. S. Pearson. 2, Sheen; Mrs. Loring; T. M. Derry (2); J. Franklyn; H. Dowsett; J. K. Fowler; G. Shrimpton; J. Webb (2); J. A. Clarke. c, Mrs. Croca.

SELLING CLASS—Hens or Ducks.—1, W. J. Nutman, Great Yarmouth. 2, T. L. Nash. 3, Miss E. A. Eeles. 4, C. G. Algar, Maldon. Local, G. S. Pearson. *he*, H. J. Gummel; Mrs. A. Tindall (2); G. S. Pearson; T. L. Nash; Rev. J. D. Peake; J. D. Bly; H. Dowsett; J. K. Fowler; W. Hargreaves; J. Hodge; G. Cottle. c, Rev. J. C. Peak; W. Howchin; E. Brown, Great Yarmouth; G. S. Pearson; T. M. Derry; J. A. Wardell.

SELLING CLASS—Bantams.—1, T. E. Thistle, Lowestoft. 2, Rev. F. Tearle. 3, E. & A. Farrington, Worcester. Local, W. Durrant. *he*, W. Robins; W. Adams; W. F. Entwistle (2); K. V. Ardagh; H. Feast; R. Newbitt.

PIGEONS.

CARRIERS.—*Cock.*—1, 2, and *he*, W. G. Hammock, Ilford. 3, F. W. Metcalfe, Cambridge. Local, G. S. Clements. *he*, W. G. Hammock. *he*, Miss F. Seaton; G. Kempton; W. H. A. Miller. c, G. S. Clements. *Hen*.—1, W. G. Hammock. 3, G. Kempton, Islington, London. Local and *he*, G. S. Clements. *he*, C. Clarke; W. G. Hammock (2). c, W. H. A. Miller; G. S. Clements. *Young Cock or Hen*.—1 and 2, W. G. Hammock. 3, Miss F. Seaton, Leeds. Local, G. S. Clements, Yarmouth. *he*, J. Ford; G. Kempton; G. S. Clements. *he*, G. H. Clarke; W. G. Hammock; F. W. Metcalfe; G. Kempton; G. S. Clements; C. J. Cave. c, J. Ford; H. Thurlow.

POUTERS.—*Cock*.—2, H. Thurlow, Lower Tooting, London. 3, W. Nottage. *he*, Mrs. Ladd, Colce. *he*, A. Slorans; J. E. Palmer; W. Watkin; H. Thurlow (2). *Hen*.—1, L. Watkin, Northampton. 2, H. Pratt, Birmingham. 3, H. Thurlow. Local, G. S. Clements. *he*, J. E. Palmer; W. Nottage. c, A. Slorans; C. F. Byford; H. Thurlow; G. S. Clements.

BARS.—*Cock or Hen*.—1, C. Norman, Westerfield. 2, A. P. Byford, Ipswich. 3, and c, Miss F. Seaton. Local, G. S. Clements. *he*, H. Yardley. *he*, H. Thurlow. *Young Cock or Hen*.—1, C. G. Cave, Spalding. 2, H. Thurlow. 3, H. Yardley, Birmingham. Local, G. S. Clements. *he*, H. Thurlow; C. G. Cave. c, A. P. Byford.

TEMPLES.—*Short-faced.*—*Cock or Hen*.—1, W. G. Hammock. 3, J. Ford, Monkwell Street, London. Local, W. Simmons. *he*, J. E. Palmer; W. D. Brown; W. G. Hammock. *he*, A. & W. H. Silvester; J. Ford; H. Yardley; S. Lawson. c, W. D. Brown. *Long-faced*.—1 and 2, A. & W. H. Silvester. 3, J. J. G. S. Clements. Local, G. S. Clements. *he*, J. Farnam; G. & W. Banna. c, J. Ford; G. S. Clements.

FANTAILS.—*Cock*.—1, Rev. W. Serjeantson. 2 and 3, J. F. Loversidge, Newark. *he*, J. Walker; F. Aldiss; H. M. Yett. c, H. Thurlow. *Hen*.—1, J. F. Loversidge. 2, Rev. W. Serjeantson. 3, J. Walker, Newark. *he*, J. Kandale. *he*, J. Walker; J. F. Loversidge. c, H. Thurlow.

DRAGONS.—*Cock*.—1 and 3, F. Graham. 2, W. Smith. *he*, W. G. Hammock. *he*, W. Atkins; A. Wren. *he*, W. G. Hammock; H. Thurlow; G. S. Clements. c, W. H. Hammock. *Hen*.—1, and 2, W. Wren, Lowestoft. 2, F. Graham. 3, W. Smith. *he*, W. G. Hammock. *he*, F. Graham; W. Smith; H. Yardley. c, A. Bentley; H. Thurlow. Local, G. S. Clements, Great Yarmouth.

ANTWERPS.—*Cock*.—3, H. Gough, Wolverhampton. *he*, Miss F. Seaton; A. Bentley; J. G. Edwards; S. Lawson; H. Theobald. *he*, H. Valtera and R. Ferrages; H. Cox; J. Robertson; H. Thurlow. c, J. Farnam; J. G. Edwards. *Hen*.—1, C. E. Copeman. 2, F. C. Russell, Blackheath. 3, H. Gough. *he*, A. Bentley; S. Lawson; H. Thurlow. *he*, H. Vaters & R. Ferrages; F. W. Metcalfe; J. G. Edwards; J. Robertson; J. W. Cradock. Local Master Stonex.

JACOBS.—1 and 2, S. Lawson, Preston. 3, Withheld. **ANY OTHER VARIETY.**—1, 2, and Extra 3, Miss F. Seaton. 3, A. & W. H. Silvester. *he*, C. Blunden; Miss F. Seaton. *he*, A. & W. H. Silvester; C. Blunden; W. H. A. Miller; T. Kandale. c, J. E. Palmer; C. B. Cross; Mrs. Wilkison.

SELLING CLASS.—1, L. Watkin. 2, Miss F. Seaton. 3, J. Ford. *he*, J. Ford; H. Thurlow. *he*, J. E. Palmer; Miss F. Seaton; Miss E. A. Eeles; C. Reed; A. P. Byford; H. Thurlow; E. Boston. c, C. Blunden; J. Ford; L. Allen.

CANARIES.

Clear.—Yellow.—1 and *the*, G. & J. Mackley, Norwich. 2 and *the*, Provart and Willis, Norwich. *he*, L. J. Salt. *Buff*.—1, G. & J. Mackley. 2, Provart and Willis. *he*, C. J. Salt. *c*, C. Rumbold, jun. Local, W. Langley.
Marked or Variegated.—Yellow.—1 and 2, G. & J. Mackley. *he*, Provart and Willis; C. J. Salt; A. Colman. *c*, C. Rumbold, jun. *Buff*.—1, Provart and Willis. 2 and *he*, C. J. Salt. *c*, A. Colman. Local, W. Langley.
Clear.—Yellow or *Buff* with *Dark Crests*.—1 and 2, F. Alden, Norwich. *the*, G. & J. Mackley. *he*, W. Langley. Local, C. Rumbold, jun.
Variegated.—Yellow or *Buff* with *Dark Crests*.—1 and *he*, G. & J. Mackley. 2, F. Alden. Local, C. Rumbold, jun.
Cinnamon.—*Jouque*.—1, G. & J. Mackley. 2, C. J. Salt, Burton-on-Trent. *he*, R. Poole. *Buff*.—1, C. J. Salt. 2, R. Poole, Maldon. Local, C. Rumbold, jun.
Selling Class.—1, Provart & Willis. 2, G. & J. Mackley. *the*, Provart and Willis; G. & J. Mackley. *he*, E. Sims. Local, C. Rumbold, jun.

The classes up to the end of the large Game were judged by Messrs. Leno and Nichols; Hamburgs and Ducks by Mr. Leno; and Spanish, French, Malays, Variety, and Game Bantams by Mr. Nichols. Pigeons, Mr. E. Hutton; and Cage Birds, Mr. H. Thurlow.

CARRON POULTRY SHOW.

This was held in the Drill Hall, Stenhousemuir, on the 18th and 19th of December. The following are the awards:—

Spanish.—1, Special, and 2, W. C. Hardie, Carron. 3, J. Hunter, Alloa. *the*, R. Barr, Burnfoot. *he*, W. C. Hardie. *c*, D. McBeath.
Dorkings.—Silver-Grey.—1 and 2, J. Fotheringham, Dunfermline. 3, W. Stuart. *the*, D. Conner, Dunipace. *he*, J. Weir. *c*, J. Malcolm. *Coloured*.—1 and Special, W. Weir, Larbert. 2 and 3, Miss M. A. P. Turnbull, Larbert. *he*, D. Draper. *c*, Mrs. G. Armstrong.
Brahmas.—1 and Special, H. Wyse, Bishoprigg. 2, J. A. Dempster, Stirling. 3, W. Weir. *he*, A. Macdonald. *he*, J. B. Cochran. *c*, D. Macfarlane.
Cochins.—1 and Special, J. Wyse. 2, Mrs. G. Armstrong, Inchture. 3 and *he*, J. Deiman, Altrive. *the*, T. Bruce, Glasgow.
Hamburgs.—Spangled.—1, Special, J. Stewart, Barrhead. 2, D. Forrester, Linlithgow. 3, T. Copland, Denny. *he*, P. McLaren. *he*, J. Blakeley. *c*, H. Stanworth. *Pencilled*.—1 and 3, H. Russell, Clackmannan. 2, J. Ness. *the* and *he*, R. Robertson. *c*, J. Kilgour.
Game.—1, Special, and 2, D. Harley, Edinburgh. 3, J. Marshall. *the*, R. Stewart. *he*, W. Jamieson. *c*, H. Paterson.
Scott-Greys.—1, Special, and *c*, T. Laurie, Linlithgow. 2 and *the*, H. B. Marshall, Airdrie. 3, J. Weir. *he*, J. Mackenzie.
Bantams.—1, J. R. Kilgour. 2, Special, and *he*, G. K. Scobie. 3, Miss B. Elphinstone. *the*, W. McGregor. *c*, J. Graham. *Any other variety*.—1, J. A. Dempster. 2, J. Aitken. 3, J. McGregor. *the*, R. Taylor. *he*, J. Marshall. *c*, T. Allen.
Ducks.—*Aylesbury*.—1, W. Stewart. 2, W. Weir. 3 and *the*, J. Anderson. *he*, Miss Weir. *c*, J. Mackenzie. *Any other variety*.—1, H. B. Marshall. 2, T. Laurie. 3, J. Graham. *the*, T. Allen.
Any other variety.—1 and 3, Mrs. J. Laird. 2, D. Draper. *the*, W. Cochran. *he*, A. Wyllie. *c*, Mrs. W. Steven; Honeyman.
Selling Classes.—*Cock*.—1, J. Marshall. 2, J. Marshall. 3, R. Barr. *he*, J. Anderson. *c*, Wyse. *c*, J. Carswell. *Hens*.—1, W. Weir. 2, J. Norval. 3, J. Carswell. *the*, D. Macfarlane. *he*, D. Macintosh. *c*, J. Fotheringham.

PIGEONS.

Pouters.—1, R. Arbuckle. 2 and 3, A. Robbs. *he*, Miss Shanks.
Pantails.—1, J. Smart. 2, Master J. Blair. 3, P. Joyce. *he*, Master J. Blair; A. Bowman.
Tumblers.—*Common*.—1, J. Glen. 2, J. Day. 3, A. Dick. *the*, J. Cassells. *he*, A. Bowman. *c*, J. Fairley.
Any variety.—1, R. Raines. 2 and *he*, T. Nicol. 3, J. Glen. *the*, J. Cowe. *c*, J. Kilgour.
Selling Class.—1, 3, and *he*, R. Raines. 2, Miss M. A. P. Turnbull. *the*, J. Robertson. *c*, R. Fleming.

Judges.—*Poultry*: Mr. T. Raines. *Pigeons*: Mr. G. J. McLean.

CANTERBURY POULTRY SHOW.

The above Show was held at the Corn Exchange on the 11th and 12th inst. If mere numbers are to be accepted as the criterion of success we can justly congratulate the Committee upon the result of their Show. In other respects we are sorry to record many deficiencies: 965 entries of poultry and Pigeons, together with 161 entries of cage birds, were crowded in a space scarcely large enough to accommodate half the number. The result was, the avenues were rendered so narrow that it was impossible to make any inspection of the lower pens. We once or twice stooped to make the attempt, but found ourselves almost immediately precipitated against the pens by the first passer-by. The Ducks, Geese, and Turkeys were consigned to the regions below, where, in addition to the gaslights, windows were superseded by an innumerable quantity of oil lamps, one being specially retained for the Judge, with an attendant to carry it to assist him in making his awards. We call attention to this matter, as we consider it is incumbent on committees when they accept the entry fees to provide accommodation for the birds where they can be fairly seen. If they are to be consigned to the coal-cellar it should be so stated in the schedule, with any note the Committee may think desirable with regard to the mode of illumination. We have further to complain of the delay in posting the prize cards. They were generally late, and some of them were not on the pens when we returned to town at seven o'clock at night. For some unaccountable reason the auction was also postponed until the following day. This was a most serious matter, as some who had travelled miles to purchase a pen had to prolong their visit longer than they had arranged, which is not always convenient, or to return without them. In the latter case the exhibitor might justly complain of breach of contract and the possible loss to him in the sale of his birds. For the reasons we have referred we are afraid to go into a critical examination of the birds in many of the classes, and only wonder the Judges were as successful as they appear to have been in making their awards.

Dorkings were divided into seven classes. Coloured, cock

and hen.—Mr. Cheesman won with a fine bird, a little faulty in comb. In the class for cockerels the competition was very close between the first and second. The pullets were not a fine lot; some of the largest birds were faulty in their feet. Mr. Cresswell showed a nice pen of Rosecombs here, which were highly commended. Silver-Greys, cock and hen.—Here Mr. Cresswell won easily. Second were rather leggy. Cockerels (pen 62).—First we thought an extraordinary bird for a cockerel. His spurs were hard and well set; he had the advantage of size; in other respects we preferred the second-prize pen. Pullets.—First and second-prize pen were good, the others moderate. Dorkings, Any variety.—Here Mr. Cresswell had an easy victory. *Spanish*.—The old birds were a moderate lot. Mr. Francis was an easy first. The cockerel-and-pullet class contained a few good birds. By far the best cockerel was to have been found in the prize pen (Howard), but he was matched with a miserable pullet, justly deprived him of first honours. *Cochins*.—Buffs were a poor lot. In the class for old birds the second and third prizes were judiciously withheld. In the young class Col. Hassard showed a neat pair. *Cochins*, Any variety.—These classes were the best in the Show. The Whites were superb, Captain Talbot and Mr. Woodgate dividing the honours in the cockerel-and-pullet class. Mr. Anns was third with a nice pen of Partridge. The Dark *Brahmas* we could scarcely see, but the first-prize old cock appeared a good bird; his partner we thought rather deficient in pencilling. Cockerel and pullets.—Mr. Rigg was first-and-cup with a fine pen. The cockerel had many good points, and was matched with a nicely pencilled pullet. Pairs of hens.—First (Jacobs), a nicely pencilled pen. The class generally was a poor one. A few nicely marked birds were to be found, but they were deficient in leg-feathering, and some that were good in other points were not well pencilled. *Brahmas*, Light, old birds.—Here we were pleased to see Mr. Cheshire again in the front ranks with a handsome well-marked pair. In the class for pairs of hens Capt. Savile won with two neat birds, pure in colour, nicely marked, and well feathered in the leg; they were rather small. Cockerel and pullet.—Mr. Petter first with a well-marked pair, Mr. Long second, closely pressed by Capt. Savile. *Game*, Reds, cock and hen.—A good class. First Mr. Jekin; he also showed two other stylish pens. In the young class Mr. Foster was first with a grand pair of Browns; Mr. Warde was second and third. The latter pen were hardly in feather. Any other variety.—First Mr. Foster again with a beautiful pen of Piles. The hen we have noticed on previous occasions. Second (Fitz-Herbert), contained a very Game-looking cock. Young class.—First Mr. Mollett with a smart bird, beautiful in colour and close in feather. *Hamburgs*.—Here the competition was not great. Mr. Long carried off the lion's share of the prizes, and won the cup with pen 303, Golden-spangled—the second-prize Birmingham cock we think, a handsome bird, his only fault being a tinge of white on the feathers between the legs. In the Silver-pencilled class Mr. Norton was first and second. In some respects we liked Mr. Norton's birds: the hens were nicely marked, and the cocks had some good points but were very coarse in the earlobe. *Houdans*.—A splendid class. First Mrs. Vallance, a grand pair; we think they have recently changed hands, and that we have noticed them on previous occasions when shown by Mr. Dring. *Crives* were nearly all good, Mr. Dring's first-prize birds well deserving the cup. *Bantams*.—Game were very numerous. In Reds Mr. Anns was first with a smart pen. The second and third were neat birds, but poor in colour and very loose in feather. Fourth contained a nice cock with a fine head, and beautiful in colour. Game, Any variety, only moderate. Blacks and Whites a large class, but we could only find three good pens, which were correctly selected by the Judge.

Ducks, Geese, and Turkeys were well supported.

The Pigeons mustered 293 entries, all the classes being well filled. *Carriers*.—In cocks Mr. Baker was first with two grand birds; and Col. Hassard in the class for hens showed a bird that well deserved her position. The *Pouter* entries surprised us. Of late we have been accustomed to see classes of only three or four entries, but here we found fifteen entries in the class for cocks, twelve for hens, twelve in the class for cock and hen, and many of the birds were good enough to hold their position in a show of greater magnitude. *Dragons*.—First (Baker), Blues; second, Whitehead. We preferred the latter, the winners being poor in colour, small, and wanting in style. We also liked pen 748, highly commended, belonging to the same owner better. Of the other classes of Pigeons the *Barbs* and *Tumblers* deserve special commendation for quality, and the Any other variety for the many novelties it contained.

Mr. Teebay and Mr. Nichols judged the poultry, and Mr. Esquilant the Pigeons.

THE LATE BURSLEM SHOW.

The Pigeons and Cage Birds were exhibited in the Town Hall, a very suitable, commodious, and light building for the purpose. Since last year a change has been effected in the secretaryship, Mr. James B. Welch filling the place of Honorary Secretary in the

room of Mr. McLachlan, who so ably carried out the first Show, but whose time is so otherwise engaged that he was compelled to relinquish the post. He, however, rendered valuable aid during the holding of the Show.

On visiting the Town Hall and Covered Market the evening previous to the Show, I found the stages and every necessary preparation made. Nothing more was required than the erecting and fixing together the pens for the poultry, Pigeons, and Rabbits. Turner's pens had been hired, but the patience of the Committee, Judges, exhibitors, and visitors were sorely taxed the following day owing to the pens not coming to hand. Towards mid-day several mechanics were engaged erecting pens for the Pigeons, and the noise of the hammers and saws somewhat puzzled many applying for admission at the doors. Towards tea-time Messrs. Holt and Allsop had patiently completed their duties.

I believe it was to Mr. Yardley that Mr. Horner, some time during the day, remarked, "We shall have to do the same as the Canary men—find our own pens." Something most certainly will have to be done to obviate the very annoying blunder occurring elsewhere. But I understand other committees have been disappointed besides the Burslem. Why should this be? I would ask. If a contract is entered into, there should be no risk about the matter. The non-delivery of the pens in proper time is a serious loss to a committee (it was so to the Burslem Committee), and, apart from the extra trouble and annoyance, it is risking the lives of valuable specimens, which have cruelly to be kept prisoners in hampers and baskets until pens are provided.

Birds are very frequently journeying to exhibitions during the whole of a night. It is essential they be fed and attended to the following morning, but if the pens to hold them are not forthcoming, it at once places a committee in a fix, with no blame whatever attached to them.

Exhibitions having increased of late years, and often more than one or two or more occurring on or about the same date, as a necessity more pens are required. Perhaps a little more competition in the letting-out of pens would be worthy of consideration; and if those who have the letting of them out were compelled to enter into a bond to supply them, it would, perchance, better ensure committees receiving the pens by a proper time. As to the outlay incurred by the Burslem Committee in having had timber cut up and engaging wire netting for the pens, will be a matter for future consideration between themselves and others.

As in the Town Hall, similar annoyance occurred in the Covered Market, by only a certain portion of the poultry being penned. The judging was thus delayed, and Mr. Cannan, the Judge of poultry, had to leave Burslem for Swarsea. Mr. Gamon, I understood, took up the remaining classes after he had been officiating over the Dogs, but it was some time before he could make much headway, through some of the birds not having been penned.

Now, apart from this most unfortunate hitch, and another annoying circumstance I will mention below, caused through the absent pens, all would have gone "as merry as a marriage bell," for every provision was made to conduct and carry out the Show in a satisfactory manner. The united endeavours of a painstaking Committee, backed up with an able staff of assistants, at length surmounted the difficulties in a cool, becoming, and praiseworthy way. Mr. Welch, the Honorary Secretary, proved himself equal to the occasion.

The Canaries had been judged in tolerable good time in the morning. Several birds entered were found to be absent from their respective classes. It was not until the Pigeon pens had been erected that the hamper of Canaries forwarded by Mr. Adams, of Coventry, was found. It appeared to have been mixed up with the hampers of Pigeons, some of which it resembled. The birds having been judged, Mr. Barnesby did quite right in not entertaining Mr. Adams's birds, although, had they been in their classes, he (the exhibitor) would have been a much greater winner than he was. They appeared quite warm enough beneath their pepper-moulded feathers, although left out in the cold.—AN EYE-WITNESS.

NORTHERN COUNTIES COLUMBARIAN SOCIETY, MANCHESTER.—DECEMBER 5TH.

WHILE inspecting the great and grand Show of the above Society, threading our way through row after row of pens of birds of the highest quality, we were impressed with the truthfulness of the popular estimate of Manchester character—viz., its originality and thoroughness; and it seemed to us that just as in the past the "Manchester School" left their footprints in the van of commercial and political progress, so now our brother fanciers there have struck out new lines, and have accomplished successfully what has never before been attempted. The Society, which consists of breeders rather than exhibitors, accepting the single-bird system as the base for competition, carried it out

to its legitimate extent by giving classes for hens equally with cocks throughout. The result was a total of 861 entries. The quality in Dragons, Antwerps, English Owls, flying Tumblers, (especially the Mottles), has never been equalled.

The Show as usual was held at Belle-Vue, the dinner, to which about a hundred sat down, being provided by the Messrs. Jennison; the Society this year giving not only a free dinner ticket for each member, but an additional one for a friend. About twenty special prizes, ranging in value from six guineas down to two guineas, were given by gentlemen connected with the Society. The most successful exhibitor was Mr. Walter Hire, who took five of these (value about £20); Mr. Ridpath being next with three, including the cups for the best bird in the Show; Mr. Clay next with three; then Messrs. Taylor, Townson, Gamon, Wright, Blum, Loversidge, Unsworth, and Ord completing the list of special-prizewinners.

[We regret the prize lists were not sent to us as they ought.—EDS.]

DRAGOONS v. HORSEMEN.

ALL our fanciers of the Dragoon proper must feel grateful to the "WILTSHIRE RECTOR" for his manly and straightforward article on this subject in the Journal of December 10th. Certainly, as to the Dragons now exhibited, the winners lay small claim to be Dragons at all. We are going "deeper and deeper still" into the heavy Carrier wattle and head. The Belfast winner, as was correctly noticed in a contemporary paper, "had a beak-wattle many a good Carrier need not be ashamed of." As long as judges encourage these the fanciers of the "light little fellow" (the Dragoon proper), need not exhibit, as the Horsemen and "weight Carriers" they have become always are preferred to the smaller birds. I for one trust soon we may see some change, or these mongrel Carriers will be the sole representatives of what once was the useful English Dragoon.—C. F. STAUNTON.

THE MEALY POUTER: ITS MERITS, &c.

IN the columns of "our Journal" of the 3rd inst., a correspondent writing on the Kilmarnock Show of Pigeons, gives me a good-natured rub on the position in which, as Judge, I placed the Mealy birds at that Show. I will readily allow that after the lengthened discussion on the subject of the "Any other colour or markings" class, it might appear to some that I ought to have placed the Mealy in the position I advocated for it; but it must be remembered that I am not the "Pigeon fancy," I am but an individual member of it, and cannot arrogate to myself the right of raising to the standard platform any bird I please. Thus it was at the Kilmarnock Show—"Reds, Yellows, or Mealies," by existing rules, and of long-standing too, I was bound to give the standard-coloured birds the preference, and would still be so bound until some understanding he come to by the "fancy." I had hoped for a public expression on this matter much more wide than has been given. From the south there is an opinion from my friend "WILTSHIRE RECTOR," plainly set forth in this Journal. Mr. Ure has as plainly given his verdict; Mr. Spence and Mr. Lyall, all on the east side of Scotland; Mr. McNaught, Mr. Gibson, Mr. McCulloch, and one who signed himself "NOVICE," but who is not of that grade, on the west side of the country. From London I have letters, from the far north, from Edinburgh, and the east. I cannot get our friends to send their views to any journal. "Oh! I never wrote for the papers," they say. In Glasgow, and all over the west of Scotland, I find fanciers on this subject of one mind, with three exceptions; one still keeps a good stock of Pouters, the second has given them up long ago, in disgust I presume; and the third, after much trouble, has been marked "not found." Now that there has been a public movement, an evident expectation that I at least should have given the Mealy a better place—viz., treated it as a standard bird, I feel justified in intimating that where I have the honour to judge in future, the Mealy shall have the same consideration as the old standard-coloured Pouters, and be treated as such, whether there be a separate class for it or no, so that my Kilmaurs friend need not harbour the least alarm.

Allow me in a few lines to give my reasons for this decision.

1st. It is without doubt the desire of a large majority of the Pouter fanciers.

2nd. The Mealy Pouter is a bird of colour as uniform as the Red or Yellow, and as liable to the same variety of shades.

3rd. It equals any of the old-named standard birds in beauty, and a Light Mealy certainly surpasses most of them, the colour being simply lovely.

4th. It is a bird bearing the same markings as the old standard-coloured birds, and as a rule it is well marked.

5th. For shape, the paramount point in the Pouter, it generally excels.

And 6th. The Mealy is after all a shade of the Blue, and when it is interbred with that colour improves it in all respects.

Last, and not least, it has become a bird of great value. At

one time it used to be entered in the catalogues at from £2 to £5; now it is entered oftener at from £20 to £50, and a single bird has been claimed at one of the former of these last sums. One of the most elegant hens at the Kilmarnock Show was a Mealy, but she, because of an old custom, had to be left out in the cold. The largest and one of the best Pouters at Aberdeen last year was a Mealy; he was bred near Edinburgh, and belonged to a family of fine Blues.

After seeing the Mealy at the Crystal Palace, no wonder that "WILTSHIRE RECTOR" said, "there ought to be a class for Mealties;" so say we, the great majority of the fancy, and so it is likely to be all over.—JAMES HUIE.

EXTENSIVE BEE-KEEPING.

BEE-KEEPING will ere long be replaced by bee-farming; young and enthusiastic apiarists are fast taking the places of the representatives of apiculture as practised in ancient times. The little badly-made straw skep so suggestive of brimstone is doomed, and its place will be filled with — Ah! that's the question; who will answer it? Mr. Pettigrew boldly predicts a great future for the hive bearing his name. Writers of the opposite school as boldly assert that the bar-frame will be the hive of the future.

One question of prime importance to be answered is, What is the best material, wood or straw? I believe straw to be better than wood for general use for this reason, that it requires more time and trouble to keep a wooden hive free from damp; and the majority of bee-keepers, having other business to attend to, can only give their leisure moments to their bees. I have never seen any dampness in a straw hive. I think the same cannot be said of the wooden one, with only the same attention paid to it. If you eke a skep with wood, the eke will be damp when the straw is quite dry. If the quilt absorbs all the moisture in a wooden hive, then one great objection is removed.

Supposing it be admitted that straw is the better material, then would arise another question: Is the Pettigrew or the bar-frame the better hive? If the former, then the bee-keeper has no difficulty in the selection, he has only to choose according to the size of the swarm a 16, 18, or 20-inch hive. If the bar-frame be voted Al, there is more difficulty in the selection, for there are Sherrington's, Woodbury's, Abbott's, Cheshire's, and many others, most of which I presume could be made in straw.

One objection often made to the skep is, that the bees waste much time in propolising: this may be true of the old-fashioned skep, badly made and loosely put together; but it is not true of the Pettigrew hive of Scotch make, well made, and tightly sewn with cane. In hives of this class, so far as my observation goes, there is only a small quantity of propolis used.

Another objection is, that the skep is "wasteful and murderous," which I suppose implies that the bees have to be smothered before the honey can be taken. That belief is fast dying out, as it is an easy matter to drive the bees, unite them to others, or sugar-feed them.

Another objection is, that you cannot see what is going on inside. A little fustian smoke will enable the bee-master to look his bees in the face, and after a little practice will be able to ascertain the state of the hive. I know you cannot see all the brood beds nor the eggs, but a little observation will enable the amateur to judge whether the hive is in a prosperous condition or not; if a fertile worker or a drone-breeding queen is in the hive. This may be ascertained either from the crown hole or by turning it up, as the elongated cells in the worker comb may be seen a long way down the hive. There cannot from the construction of the hive be that minute inspection to which the bar-frame owes its popularity.

Another objection is, that the skep being of fixed size you cannot contract it or give the extra space sometimes required. If the hive be suited to the size of the swarm, and the bees afterwards require more room, the eke or the super will give it; but suppose the weather be unfavourable and little honey procurable you cannot contract the hive, then I would feed liberally as long as necessary.

Now that the slinger is an established fact, another objection is, that you cannot sling the honey and return the comb; there is consequently a loss of honey through the bees having to make fresh comb for all the honey they gather. That may be true, but is it all profit? I think it is admitted both by the advocates of the bar-frame and the skep, that honey just gathered is not honey of the right quality. According to one theory a certain time must be allowed for evaporation; according to the other theory the bees must re-swallow it, and again deposit it in the cells before it can be honey proper. If with the aid of the slinger the honey be extracted the day it is gathered, it must (if either of the above theories be correct), be of inferior quality. And again, what becomes of the unsealed grubs? Do they go forward into the honey? They are "juicy" no doubt, "and would help to weigh," as a writer in another Journal remarks, when depreciating the hand-pressure practised by the proprietors of the objectionable skep. I for one shall be glad, very glad, of any

invention that will get the honey out of the combs quickly at the right time, for to me honey-taking is the most disagreeable part of bee-keeping. I would rather swarm twenty hives than take the honey from one. A short time ago I was very pleased to hear that one of the slingers was at work a few miles from here, I went to see it. It cleared the cells of clover honey, but it was powerless to remove heather honey, and alas! all my doomed hives had been to the moors.

Another objection to the skep is, that when there comes a glut of honey the brood cells are filled and breeding is stopped. I think the remedy is easy. Give more room above or below, for the bees would rather stow their sweets anywhere than in the centre of the hive.

And now, my brethren of the bar-frames, I am not endeavouring to disparage the hives you recommend. I know but little of them practically. I have only one; I intend, if all be well, to have another or two next season, and by careful observation to test their merits. It is with very great pleasure that I read of the scientific experiments of some of our great bee-masters; yet I should be afraid that the complicated hives which yield such great results under their skilful manipulation and practised management, would, if placed in the hands of very many bee-keepers, bring disappointment and loss.

It is too much the fashion to hoist one's own flag, at the same time endeavouring to trail our opponents' in the dust. Let there be a fair conflict of opinions without personalities, and then the truth will out.—J. OLIVE, *Hartington, Derbyshire.*

THE SENSES OF BEES.

It is rather astonishing that any naturalist should doubt the existence of any of the five senses in bees, which they and many other creatures possess. Francis Huber himself rather doubted that bees possess the sense of hearing. I knew a minister of the gospel and student of nature who maintained that bees are blind. An English baronet and M.P. has recently delivered a very good lecture to the members of a natural history society on the habits of bees and ants. This lecture has been pretty widely published, and contains the results of some very interesting experiments which he has made to test the truth of what some writers have advanced touching the senses and capacities of bees. So far as his experiments go, although they are not conclusive (and this he admits), bees do not deserve the good character which is so often given them. They lack affection for one another, and their devotion to their queen has been over-coloured. They are minus sympathy for suffering companions; have no appreciation of colour, no powers of communicating ideas to each other; and some are more stupid than the rest. These are a few of the convictions obtained by the lecturer from the experiments he made last summer. It is to be hoped that he will repeat his experiments next season, and institute others of a like nature, for bees have many traits of character not yet explained or understood; and there are many secrets in their history difficult to penetrate.

In this letter I propose to take a mere glance at the five senses of bees—viz., sight, touch, hearing, taste, and smelling.

1, *Sight*.—That bees can see distant objects is proved by the fact that they often fly in a straight line to them. That they see near objects may be observed in their going in and out of their hives, and winding their way through a thicket of trees without touching a twig or a leaf. If bees be taken into a room during the day they fly to the light; and if taken into a dark room and shaken on the floor they will travel towards a lighted candle within eyesight of them. I once saw half of a large swarm or stock of bees run along the ground many yards after the moon. A cartload of hives were placed in my garden late one night. One hive was on the point of suffocation; it was placed on the ground and its door opened. Unfortunately the moon was in front of the hive, and as the bees gushed out of the hive in a continual stream they all ran in the direction of the moon. As soon as I discovered the mistake I turned the back of the hive to the moon, and stopped the numerous pilgrims on their march by placing a large door between them and the attractive satellite. The hive was placed in their midst, the noise of which brought them all home.

If two bees be carried in a room, and one of them find a way of escape more readily than the other, we should charitably conclude that the escape is owing more to an accident of good luck than to an evidence of greater intelligence.

2, *Touch*.—What sense but touch enables bees in the darkness of their hives and the darkness of night to lay the foundations of their combs at proper distances from one another, to erect cells and combs of exquisite form and beauty with the smallest possible amount of wax? By the sense of touch eggs are set and tended, food is mixed and administered to young bees in portions suited to their age and wants. Is it not by their sense of touch that bees often recognise their queen, and convey ideas or impressions to one another? Is it by sound or touch that a whole swarm is made aware, all but instantaneously, that its queen is lost? And while the bees are wild with grief, uttering loud

lamentations, they can be as speedily hushed into perfect quiet and contentment by the restoration of their lost queen.

3, *Hearing*.—The lecturer did “not think that bees possessed any powers of hearing. He had shouted, screamed, played on the fiddle, and made other noises, but they took no notice whatever.” Bees can both make and hear sounds. They have a language well understood by themselves. In times of activity they are seldom dumb. A single bee can give a note of alarm or a cry of pain that affects the whole community. With the point of a penknife I once caused a bee at the door of a hive to utter a cry of distress, which instantly produced the responsive hush of disturbance throughout the whole swarm. In a hive of bees there may be heard the sounds of grief, of joy, of peace, of trouble, of starvation, and of suffocation. It is the noise of bees in swarming that keeps them within earshot of one another; and this noise never wholly subsides till all have clustered in a mass like a bunch of grapes on the branch of a tree. If bees were deaf, sounds would be of no avail; but many different instances and occasions could be named in which sound is a very useful instrument in the economy of a hive of bees.

Bees will follow the sound of their own hive in a dark place and in daylight as hounds follow a fox. It were an easy matter to make bees on the floor of a house at night follow the noise of a strong hive from room to room over the whole house, and even from one end of a garden to the other end.

4.—The sense of *taste* in bees does not admit of doubt, though we know very little about it. The fact that bees resort to the water of dunghills and the secretions of an insect does not prove that their sense of taste is imperfect. The saline matter of manure is useful for breeding purposes. If the syrup of sugar be made too weak bees will not take it. If six dishes of honey be placed on a garden walk beside six of good syrup the bees take all the honey first, afterwards the syrup. If honey be given to them in a warm state they generally overload themselves, and cannot fly for some time.

5, *Smell*.—This sense in bees is wonderfully acute. They can smell the nectar of flowers at some distance and go direct to it. We have seen bees on the way to the fields halt over the mouth of an uncorked bottle of syrup in our hands, and drop on to it in an instant. We have seen bees dance around the chimney top, and drop down the chimney to get the honey in the room below, which they had smelled. We have seen honey placed in a dark kind of cellar behind a room 10 yards wide; bees scented this honey, went in by the door, flew across the room, and crawled on the floor of the dark cellar till they reached the honey. The sense of smell in bees is so keen that they can detect the presence of strange bees in their hives, and are greatly offended at the breath and sweat of human beings.

Bees have good memories as well as acute senses. If they feed one day from a plate placed in a particular spot of a garden they will go back next day or next week to see if any more can be obtained. If weather keeps them at home for weeks they remember the place, and go to it as soon as they leave their hives.

We think that bees are very clever little creatures, and that they have the power of conveying ideas to one another. If one or two robber bees find access to the honey of a weak hive or stock, the community to which the robbers belong generally gets all the honey in a very short time. This is almost invariably the case: one hive getting the whole of the booty before the other hives are aware that any booty can be had. If bees have no powers of conveying ideas to their own community, how does it happen that one hive gets all and the rest none? We have frequently resorted (on a larger scale) to the same kinds of experiments that the baronet adopted, but the results and conclusions were quite the reverse of his. Again: When one hive is robbing another there is, generally speaking, no resistance offered, and the robbers never cease till they have carried every particle of honey to their own hive. If the undefended hive be removed from its stand before all its treasures are gone, and a strong hive be placed where it stood, the first robbers that come now find a resistance too great for them, and the whole of the fraternity of the robbing community are speedily made aware that “their game is up.”

In preparations for swarming is there no community of ideas? no internal arrangements made? Twenty or thirty thousand bees are about to emigrate and leave twenty thousand behind in the mother hive; those that go have to take rations to last three days, and to be ready by twelve o'clock! Is all this mere blind instinct? The question cannot be answered in the affirmative by—A. PETTIGREW.

OUR LETTER BOX.

FOWLS FOR LARGE RUN (H. T. P.).—You may easily keep two hundred fowls in the space (seven acres of grass and an orchard), and with the appliances you mention you may keep more if you will. The only thing you must strictly observe is, the fowls must have separate houses for roosting, laying, and sitting. They will not do well if they roost with Ducks or Geese.

BREEDING AGE (Notice).—You do not mention the ages of the fowls; we therefore take it for granted the cock is at the least as old as the pullets. You may set the eggs after the first twelve have been laid.

ENDURANCE OF MALE INFLUENCE (W. A.).—If hens, they are not now probably laying, and they are not likely to do so during the present weather. You may, therefore, put them to any cocks you please, with the expectation that when they lay the eggs will be the produce of your arrangement. If they are pullets, and now laying, we should not be satisfied with less than a fortnight's separation. It is, however, a disputed point, and many good authorities are content with three or four days' separation from one, and two-days association with another.

PORTSMOUTH SNOW.—Mr. A. Kitchen writes to us that the White-booted Bantam cock noticed by our reporter as having roup “was perfectly well when sent, and on his return had no signs of roup.”

CRUVE-CEURS' THROATS AFFECTED (H. B.).—The severe weather has caused some sickness, but we have not heard of much. Cruve-Ceurs are subject to illness while in progress of acclimatising, but as a rule they recover. We find the best treatment for French breeds to be, to keep them on soft food, and to allow them no water, except a drink in the morning and another in the evening. We never allow them to have water by them.

HOUDAN PELLETS (A Puzzled Inquirer).—If you had referred to a recent number of the Journal you would have found in Jacque's “The Poultry-Keeper” an excellent description and figure of a Houdan pullet; but as you have evidently got into a bad strain, we will say that the wattles ought to be small, red, and neatly rounded; that instead of a fluffiness under the chin it ought to be a full beard, reaching back to the eye and closely set. Unless these conditions are present the pullet is comparatively worthless.

NORWICH HEN CANARY NEARLY BOLD (P. W.).—Not having the opportunity of seeing the hen Canary it is more difficult to prescribe; but from what you state it appears the bird has not undergone a thorough moult, understood by many as having been “set fast in the moult.” Had the hen moulted properly it should be in good plumage now. Birds kept in a room heated artificially during the day, but without that artificial heat during the night time, cannot be considered to be in an “even temperature;” and having to exist in such continuous changes they cannot possibly pass through their moulting sickness as those birds kept in a room entirely without fire both day and night. Thus a stoppage in the moult is no uncommon occurrence, and disease and death is thereby often brought about. Your bird evidently is in an unsatisfactory state of health, or it would not be in the condition it is. To remedy a defect in the feathers extreme measures are sometimes resorted to, such as a transition from cold to heat, or *vice versa*, for a week or so, the bird being well kept up in diet. Nothing will more certainly bring on a moult. It is a kind of kill-or-cure system, but sometimes good results from it. If a bird will thus moult freely it will do well; if otherwise, its life is jeopardised with the experiment on nature. If, on the other hand, the deficiency of feathers generally about the hen is caused or brought about through a surfeited scurf upon the skin, somewhat of an oatmeal appearance, the parts affected may be slightly and carefully anointed with oil of sweet almonds, or butter or lard, and the bird put through the washing process—the same as recently published in the Journal. Whichever way the hen is affected it will be well to administer one or two drops of castor oil, followed up occasionally with a little cold soaked bread, to which must be added a few drops of cod-liver oil, or otherwise a piece of beef suet to peck at. This fatty or oleaginous diet keeps up a moderate degree of heat in a bird's system, which in autumn or winter especially is essential. Also supply the hen occasionally with a little bread and milk, a small portion of bicuit mixed with sherry and cayenne pepper, a rusty nail and scraped stick-liquorice in the water, sometimes a little treacle, now and then a spurting of sherry from the mouth over the bird, a few groats, a small piece of salt, a large cage to exercise in, with a bath occasionally, and plenty of grit sand and crushed old mortar, and lettuce, linseed, or cress seed. The above are essential in the way of a change, and if birds are expected to thrive they must be attended to. Disease and weakness is often brought on through neglect, and equal harm is done by continually pampering and supplying them too freely with food in addition to the usual canary, hemp, and German rape seed.

RABBIT-KEEPING (Tyrol).—A hutch such as that described in our Journal of the 10th inst. with a fence round it would answer well for Rabbits bred for table use. The hutch should be of substantial boards, and tarred or painted to exclude wet.

BEES IN WINTER (P. H. P.).—Your first attempts at bee-keeping have been very successful and encouraging, and we hope you will realise a large harvest of honey next year, and an increase of stocks. You need not uncover or examine your hives till the middle of February, when the floor-boards should be well scraped and cleaned. During the winter do not let the bees come out while snow is on the ground. We regret that hive-makers or dealers do not advertise their goods sufficiently. They might double and treble the demand for hives by advertising. Write to Mr. R. McMillan, 41, High Street, Kilmarnock.

REMARKS.

- 16th.—Snow 3 inches deep in the morning; slight snow at intervals all day, but very bright at times.
- 17th.—Fine and frosty; snow still on the ground; slight thaw in the evening.
- 18th.—Fair all day, but a slight addition to the snowfall about 11 p.m.
- 19th.—Thawing slightly all day; very dark and snowlike for a short time between 1 and 1.40 p.m.; fine bright afternoon.
- 20th.—A bright frosty day; rather warmer at night.
- 21st.—Another fine frosty day.
- 22nd.—Very cold all day, and the roads and paths very slippery and dangerous.

From observations taken near London during forty-three years, the average day temperature of the week is 49°; and its night temperature 35.3°.

MISTAKES ABOUT HOT-WATER ARRANGEMENTS.

SAID a brother horticulturist, "How I envy you your beautiful forcing houses, so well built, so light, with abundance of hot-water pipes for both top and bottom heat, with screw valves on flows and returns, and such a clever system of ventilation too! Anybody could grow plants in such houses as these. You have only to make your wishes known as regards temperature in each division, and by the turn of a screw it can be had to half a degree." Yes, they are nice houses, with plenty of piping, plenty of valves; they are cleverly ventilated, and have many other good points, but they also have two or three serious defects, which I wish to make public for the benefit of other people who may contemplate building or heating such structures.

Well, then, as to heating. I believe my friend expressed what is a very general opinion, that if you have a good boiler, and plenty of piping, with valves for each division, everything ought to work satisfactorily; but in practice we find that more depends on the arrangement of the heating apparatus than upon the shape of the boiler or 100 feet more or less of piping. Hot-water engineers will tell us they do not mind dips; and if their work and material are supplied by contract, you will probably have plenty of them, unless you insist at the first outset, as I always mean to do whenever I have a voice in the matter, not to have one whenever it can be avoided, and it generally can by using a few feet extra piping. What I mean by a dip is when the pipe descends, as it often does, to cross under a doorway or path and rises again. Now, in about 120 yards I have eight such dips, and there need not have been one. They do not dip down to the level of the boiler, and for that reason are not so bad as they might be. Started fairly on a summer day with cold water in all the pipes they will work beautifully, but whenever a severe frost comes they are sure to be troublesome, and the circulation often stops suddenly on one or more divisions, and not always on the same. There is nothing effectual then till the valves are turned down in all the divisions which are heated, and the water, if it flows at all, must of necessity flow through the open ones. In addition to the dips the return pipes inside the houses are placed higher than the flows, and the consequence is that when the hot water in the boiler is forced suddenly to displace some that is quite cold in a portion of the pipes it often commences to do so at the wrong end, although the main flow and return, which are outside the houses, are fixed in the ordinary simple way, one above the other.

But why all these complications and antagonisms to natural laws? Why drive a good servant to do work in a roundabout unnatural way when better results may be obtained by mere gentle leading? We are so apt, in matters horticultural especially, as soon as we begin to

know a little about Nature's workings, to fancy we can do things in a much better way than that old dame ever thought of. We dismiss her without thanks, and begin our work in a diametrically opposite way, but after struggling on for a time, and meeting with many failures, we are very glad to come back again to her own sweet simple laws: hence we find elaborateness and complications mostly with beginners. Simplicity and an approach to perfection comes after a more extended practice.

But some may say, What has Nature to do with cast-iron pipes and screw valves? It is not the pipes but their contents. Nature has laws which regulate the movements of fluids according to their specific gravity. If you place warm water in the bottom of a vessel, and cold on the top of it, Nature will not allow it to remain there, and if by a lot of scheming you can possibly get the old lady under your thumb, you will always find she has a rebellious spirit ready to break out when a favourable opportunity offers; therefore take her into your confidence, acknowledge her indispensable aid, and all will go well.

There is a wrong idea prevalent, too, about valves, many people think you can regulate the flow of hot water in the same way as water that is not heated. So many turns of a screw will admit so much water, and keep house No. 1 say 15° lower than No. 2, while the arrangements in both are exactly the same. It is not so. If the valve is turned sufficiently for the water to flow at all safely, there will be when the water is hot as much flow through the half-opened valve as there will through that which is wholly opened; what is lost in volume will be made up by increased velocity. Engineers know and acknowledge this when they connect one series of pipes with another by means of a single piece of very small diameter: the small connection does not impede the circulation in the least, it goes on just as fast as if the large pipes had been continued throughout. When a number of houses are heated from the same boiler, and some are required occasionally to be kept at a lower temperature than the others, if they all contain the same amount of piping there should be provision for preventing the heat circulating in a portion of the pipes, or there will always be a difficulty in regulating the temperature. In my own case, for instance, all may be left in perfect order at eleven or twelve o'clock on a frosty night, but by five or six in the morning the Primroses and Cinerarias may be luxuriating in a temperature of 65°, and the French Beans and Cucumbers at 40°. I am happy to say I have only one specimen of this kind of heating: other three examples are extremely simple and almost perfect.

There are sometimes mistakes made in having the main pipes too small where a large quantity of pipes are heated from one boiler. We are too fond of 4-inch pipes; much fuel and labour would often be saved by having mains 5 or 6 inches in diameter. I have known cases where the water was boiling over, and yet the pipes were not hot, simply, I believe, because the return

water could not get back to the boiler quick enough.—WILLIAM TAYLOR.

EVERGREEN HEDGE PLANTS.

I HAVE read with much interest Mr. Kent's remarks on evergreen hedges (page 537), and as his list of plants suitable for the purpose is a numerous one, I have in reality but little to add in the way of variety, excepting in one class which he may have omitted inadvertently, and that is the family of *Berberis*, one at least being well adapted for the purpose. *B. Darwinii* makes, perhaps, as good a hedge as anything I am acquainted with, and I am not sure but it would answer the purpose of a fence as well as an ornamental hedge. Its hardwooded sturdy stems, loaded with leaves almost as pretty as the Holly, and in early spring presenting us with a mass of orange-coloured flowers of great beauty, form on the whole a hedge by no means the least ornamental of the whole class, and as formidable a one for a pedestrian to penetrate as the Holly itself, as I have on more than one occasion discovered to my cost. It is also very likely *B. Wallichii*, which somewhat resembles it in habit, may be also equally good, as it grows quite as well, and its foliage in the distance might be taken for *B. Darwinii*, and both bear the knife well. I fear none of the larger-leaved species, now called *Mahonias*, will answer so well, *B. japonica* getting tall, but naked at the bottom, and the same with its compeer *B. Bealii*; while the common *B. Aquifolia* is better adapted for spreading than getting upward, and like the common Gorse, which is now and then used as a hedge, occupies more ground than can often be spared. Whereas, for most ornamental purposes, an upright growth with a stiffness of habit is wanted in a hedge plant; and, as Mr. Kent justly observes, the upright *Euonymus* seem well adapted—better, I should say, than *Ligustrum ovalifolium*, which gets naked at bottom before it ought to do so, even as a solitary plant.

There is one plant not yet mentioned that I think may be worked-in with great advantage in places where it thrives, and that is the Sweet Bay. Some years ago I had occasion to plant a few in a short row, which very quickly of themselves and with scarce a touch of the knife formed a very nice hedge. Its growth being mostly upward, it required little cutting except at top; and where a tall hedge is wanted I am inclined to think this will equal any of the *Arbor Vitæ* or *Cypress* class, besides being more sturdy and less likely to open with heavy snows. But I am not sure but the common *Arbor Vitæ* will sooner become a hedge, as they bear transplanting when of a large size better than many other things, while some of the *Cypresses* are about the worst. Leaving the latter class, however, as Mr. Kent has already exhausted the list of most useful kinds, I think he has not sufficiently advocated the claims of the common tree Box which, next to the Yew and Holly, is most often met with in places where a permanent hedge plant has been reared; and differing as it does from either of the above, I don't think that with all the multiplied species of plants we now possess available for the purpose, that three more suitable than these could be picked out. True, those of *Conifera* grow faster and may attain a greater height in a limited time, but they also look shabby sooner, and seem by the habit they assume to be better adapted for the shelter of nursery stock than to ornament a lawn. The Yew especially carries a stamp of dignity with it that often acts as a preservative to it when many other things are sacrificed to the utilitarian hand of building improvements. A Yew hedge of some antiquity is often so sufficiently respected as to keep bricks and mortar at a distance, and one or two that I have seen are reported to have withstood the rise and decay of two sets of buildings whose presence they embellished. But I fear there is an erroneous impression abroad about the time it takes to form a decent Yew hedge, which under favourable circumstances is not so serious an affair as is supposed. I recollect some years ago planting a hedge, which in six or seven years looked as well as it was needful to do, in fact was hedge-looking and promising in about half that time. But they were rather stunted plants to begin with, they having been transplanted the year before they were finally put in their places, which is an important matter with the Yew, than which I know of nothing that transplants better.

On this head we need not enlarge further; rather let us look round and speculate on the merits of other evergreen shrubs for the purpose of creating hedges or screens, and omitting the *Conifera* for reasons stated above, let us see what else we have

to work upon. Beginning, therefore, with the ordinary evergreens we have *Aralia japonica*, or rather *A. Sieboldii*, a hardy plant, not at all suitable in consequence of its large foliage. Neither are any of the *Arbutus* that I am acquainted with, as heavy snows open them; but I am not sure but a very fair hedge might be made of *Alaternus*. Its glossy green leaves look well, although they are more thin than could be desired for this purpose. But I hardly know what to say of the *Aucubas*, as the choicer late varieties are not sufficiently plentiful to be so applied, although they may very likely do; and for a low hedge or edging of, say, 3 feet high, I don't think anything is better adapted than the common one, which also bears cutting well, only it ought to be done with the knife.

The Sweet Bay I have already recommended, and also one or more of the *Berberises*. Of the varieties of Box I don't know that any exceeds the common tree Box, the greater number of those in ordinary cultivation being varieties of it, and in the distance are not sufficiently distinguished from it to be regarded as distinct species, excepting the one from the Balearic Islands, which, though handsome as a single specimen, is not sufficiently clothed with foliage to make a good hedge plant, and I would not recommend any of the variegated varieties.

None of the *Ceanothus* genus are sufficiently hardy to make hedges, but the two *Colletias*, *C. cruciata* and *horrida*, would make formidable barriers; but they are not evergreens in the ordinary sense of the word, although their stems, which are closely packed together, are green in colour; but as I have in another place advocated the claims of these I need not enlarge further. The white-foliaged *Elæagnus* may be pretty, but I am not sure it would look well; and the *Escallonias* seem disposed to keep near the ground rather than ascend; while the *Euonymus* have been already alluded to, and the common ones are unquestionably good. Gorse is more in the character of a nondescript fence than an ornamental hedge plant, being often enough met with in wild uncultivated districts, which the ordinary Quickset can hardly be expected to do. *Griselinia littoralis*, although one of the prettiest of our evergreens, is not adapted for hedge purposes.

The Holly family are all good, but none more so than the common one; but the merits of this genus might form a chapter in themselves alone, I therefore pass on. The common and Portugal Laurel as well as the *Laurustinus*, the first-named not bearing cutting so well as the common; while the *Laurustinus* ought to be allowed a wider space than is common with hedges usually so called. In fact it never looks so well in a trimmed condition as when left allowed to assume its own natural growth, although I don't know of any plant that will endure the knife better; and in places where it thrives a bank of it, flowering as it often does for eight or nine months in the year, is an object equal in beauty to the most carefully trimmed hedge of any kind.

The *Phillyreas* differ considerably in accordance with the position they are planted in, but *P. latifolia* and *P. levis* would seem to be the best or most likely to make a good hedge, but I can hardly recommend them. Everyone knows the utility of the common Privet, which is superior to that of *L. ovalifolium*; and from what I have seen of the Japan and Chinese species, they seem to lack that density of foliage necessary in a hedge plant. The Evergreen Oak is also not satisfactory in a hedge, the white downy appearance of the under side of the leaf detracting from the green hues expected in a hedge; while none of the *Ruscus* or *Raphiolepis* family seem adapted; and I fear the *Veronicas*, having a New Zealand origin, are also unsuitable, which brings the list to an end.

As I necessarily omitted all *Conifers*, which most of the ornamental hedges exceeding 4 feet in height are often composed of, and which in number form so many varieties, for I have seen the common Spruce kept trimmed to live at a much less height than 3 feet, while *Arbor Vitæ* are met with of great altitude, for Mr. Kent has alluded to all these it is needless to go over the ground again; and as the bulk of the shrubs called American plants in general unsuitable, I cannot remember of anything else in the way of evergreens that can conveniently be worked into this purpose without being supported or in some way or other assisted in making what they profess to be; for a supported mass of evergreens are more in the character of a screen than a hedge, and trelliswork covered with Ivy makes perhaps the best-looking of all tall uniform-looking hedges, and in this way are perhaps more really useful than any other plant I know of. But as other plants are equally eligible, as *Honeysuckle*, *Jasmine*, *Clematis*, &c., they can hardly claim to deserve the name "hedge," which is sup-

posed to be composed of plants supporting themselves. We may therefore be reasonably excused calling the latter screen-plants, and as these might form the subject of an article by themselves we need say no more on the matter of evergreen hedges; but at the same may remark that deciduous ones are also not without their merits. And amongst those having a claim to be called ornamental the Fuchsia does not rank lowest, and some time ago I noticed an ordinary road or lane in Cornwall that had a Fuchsia hedge on the top of a sort of ridge on each side of it, being the only living fence there was, and being in flower at the time I need not say it looked well.

There is certainly nothing gives a district a more dressy appearance than nice well-trimmed hedges. Whatever the objections of those who claim to be authorities in what constitutes rural beauty may be, the hedge is one of the things that common people take a pleasure in; and whether it be the tall carefully trimmed Holly hedge that screens a villa from the highway, the broad roof-shaped Yew hedge that marks the boundary of the dressed ground belonging to the mansion in the sixteenth or seventeenth centuries, or the neatly trimmed quickset which everyone can remember being planted, all and each have their admirers, not alone for their beauty as objects of art, but for their useful purposes as well; and much as hedges have been condemned, or rather were condemned, in purely agricultural districts as encouraging small birds, &c., we are not sure but that even the latter have their good properties, and in places where shelter is required there seems nothing so well adapted to the purpose as the hedge. Some that have been encouraged in the Hop-growing districts have attained a height of upwards of 30 feet, and are trimmed to that height; but as these are mostly of the deciduous class nothing more need be said on the matter. Suffice it to say that the hedge as a feature in the dressed grounds does not occupy so important a position as it did many years ago, the irregular shrubbery effecting the object mostly accomplished by the hedge; but as the latter only takes up a small fraction of the space required for the former its utility is often called upon. And the list of plants now available for the purpose is such as leaves little more to be wished for; and those wishing to have one differing from that of their neighbours can easily obtain it by looking over the list given by Mr. Kent as well as those named above, besides which there are doubtless some adapted to certain localities or conditions that have not been mentioned at all, as the number of hedge plants is almost legion.—J. ROBSON.

SELECTION OF ROSES.

SUMMER ROSES.

I do not recommend summer Roses to persons who keep only a few Roses, nor do I recommend them to be placed in the rosery; but I recommend them to persons who have large domains with long walks and glades, and places away from the rosery. Summer Roses only bloom once in the year, but give an abundant series of from three to five weeks duration. This may be prolonged by duplicates, by cutting-back at different times, and also by removal.

Summer Roses have these good qualities:—They are hardier than the autumnals (excepting *Éillet Parfait*); they are better scented; you may cut them for bouquets without injury to their future prospects; as they make their wood for the next year after blooming, and though they give only one series, they produce probably more Roses in that series than the autumnals do in a season. They are very suitable for bouquets during the London season. Autumnals do not like being cut till after they have dropped their first flowers, the wood is then ripe.

In the year 1860 and the spring of 1861 I lost only three Briar summer Roses out of 150. Only four of my Briar autumnal Roses survived—namely, *Mrs. Bosanquet*, *La Ville de St. Denis*, *Sir J. Paxton*, and *W. Griffiths*. My *Manetti* Roses suffered much, but not so severely.

The following summer Roses are the finest in their class:—*Provence Roses*.—*Dometille Becar*, the old Cabbage Rose. *Damask Roses*.—*La Ville de Bruxelles*, *Madame Zoutman* or *Soetmans*, an improved *Compte Plater*, and still one of the finest in the creamy-white line. *Moss Roses*.—The common Moss, *Crested*, *Gloire des Mousseuses*, *Vandaël*, and *White Bath*. I know of only one good autumnal Moss Rose—viz., *M. E. Ory*. *French Roses*.—*Boule de Nanteuil*, *Kean* or *Shakespeare*, *Cynthia*, *William Tell*, *La Volupté* or *Letitia*, *Napoléon*, *Obl*, and *Triomphe de Jausseus*. *Éillet Parfait* is

too tender for glades, but it is the most beautiful of all the variegated Roses. *Tricolore de Flandres* and *Madeline* are beautiful variegated Roses, strong growers, and hardy, and suit glades and long walks. *Hybrid Bourbon Roses*.—*Coupe d'Hébé*, *Paul Ricaut*, *Charles Lawson*, *Juno*, *Charles Duval*, and *Paul Perras*. *White Roses*.—*Madame Andot*, true flesh; *Queen of Denmark*, very beautiful. *Hybrid China Roses*.—*Madame Plantier*, pure white; *Brennus*, *Chénédol*, *Général Jacqueminot*, the best of its class; *Fulgens* as a weeper, and *Frederick II.* as a lofty pole Rose. These are the cream of the summer Roses, and well known to me, though I do not keep them now.

AUTUMNAL ROSES.

Macartney Roses.—*Maria Leonida*, curious and very beautiful. *Moss Roses*.—*M. E. Ory*. *Hybrid Perpetual Roses*.—These and the Tea-scented *Noisettes* are the most desirable and successful. *Achille Gouod*, *Abel Grand*, *Alfred Colomb*, *Anna Alexieff*, *Baron Adolphe de Rothschild*, *Baron de Bonstetten*, *Baron Chaurand*, *Baronne Prevost*, *Baroness Louise Uxkull*, *Beauty of Waltham* (it is not the same as *M. C. Crapelet*), *Black Prince*, *Caroline de Sansal*, *Charles Lefebvre*, *Claude Levet*, *Comte de Nanteuil*, *Comtesse de Chabillant*, *Countess of Oxford*, *Devienne Lamy*, *Dr. Audry*, *Duc de Cazes*, *Duchesse de Caylus*, *Duchesse d'Orléans*, *Duke of Edinburgh*, *Duchesse de Cambacères*, *Edward Morren*, *Elie Morel*, *Empereur de Maroc*, *Etienne Levet*, *Felix Genero*, *Fisher Holmes*, *Gloire de Ducher*, *Gloire de Vitry*, *Glory of Waltham*, for poles; *John Hopper*, *Jules Margottin*, *Lady Suffield*, *Duchesse de Morny*, *La Ville de St. Denis*, *Leopold Premier*, *Lord Clyde*, *Louis Van Houtte*, only on seedling Briars; *Alice Bureau*, *Madame Boll*, *Madame Chirard*, *Madame C. Joigneaux*, *Mad. Creyton*, *M. C. Crapelet*, *M. E. Boyan*, often like *Madeline*; *M. G. Swartz*, *M. J. Paron*, *M. la Baronne de Rothschild*, *Madame Rivers*, *M. Vidot*, both require rich loam; *Mlle. Annie Wood*, *Madame Louise Carique*, for poles or walls; *Monsieur Woolfield*, *Pierre Notting*, *Madame Victor Verdier*, *Marguerite de St. Amand*, *Mlle. Marie Rady*, *Maurice Bernardin*, *Maréchal Vaillant*, *Mlle. Therese Levet*, *Maxime de la Rocheterie*, a strong-growing, very large, and splendid purplish maroon; *Monsieur Boncenne*, *Pierre Seletzky*, *Prince Camille de Rohan*, *Prince de Portia*, *Princess Mary of Cambridge*, *Senateur Vaisse*, *Souvenir Dr. Jamin*, *Souvenir de Reine d'Angleterre*, *Souvenir de W. Wood*, *Baronne Pelletan de Kinkel*, *Thyra Hammerick*, *Triomphe de Caen*, *Vicomte Vigier*, *Vicomtesse de Vézina*, *Victor Verdier*, and *W. Griffiths*. *Bourbons and Bourbon Perpetuals*.—*Acidalie*, *Souvenir de la Malmaison*, *Baron Gonella*, and *Baronne de Maynard*. *Tea-scented Noisettes*.—*Maréchal Niel*, *Triomphe de Rennes*, *Celine Forestier*, and *Gloire de Dijon*. *Tea Roses*.—*Devoniensis*, *Souvenir d'Elise Vardon*, *Madame Willermoz*, *Souvenir d'un Ami*, *Duchess of Edinburgh*, *Sombreuil*, *Madame Levet*, *Marie Sisley*, *Adrienne Christophle*, and *Madame Margottin*. If the reader selects six, let him take the five first and last Rose, and he will have six of the best. *Sombreuil* I believe to be a China Rose. It has no scent, but is very hardy, and a fine, late, autumnal bloomer.—W. F. RADCLIFFE.

OUR ANEMONES.

THE herbaceous Anemones will thrive in most ordinary soils and situations, but I am inclined to believe, when they are provided with suitable soil and situation, they are more interesting, showing their character much better than when starved and left to linger out a miserable existence.

A deeply-cultivated border of good loam, with well-rotted manure, vegetable matter or leaf mould, a little coarse sand well incorporated together, with good drainage, and watering in dry weather, is essential to their well-doing. If the situation is sheltered, so much the better.

The taller kinds will require staking to prevent their being broken with the wind. They should not be tied into bundles, for that spoils their appearance. A neat stake placed in the centre of the plant, two or three of the centre shoots tied loosely to the stake, and a string of twisted matting loosely round all the stems, arranges them well.

The border should be kept free from weeds and vermin, and with such treatment there will be a chance to succeed.

To make a selection from a numerous family all beautiful would be a difficult task, yet some may appear more attractive than others. *Anemone japonica* should have a place in all herbaceous borders; it does well in partial shade, but delights

in sunshine. Years ago we used to tend it carefully as a greenhouse plant, and it is still useful for that purpose for late autumn and winter decoration. It is easily increased by offshoots and division in spring. Whether *Anemone vitifolia* is a variety of the above I am unable to say, but it is a very desirable plant, and should not be overlooked by the collector of herbaceous plants.

Anemone rivularis is worthy of more extensive cultivation than it is receiving; its beautifully-coloured flowers ought to secure it a place in all collections. *A. sylvestris* is a very choice species, being a late-spring and early-summer bloomer. *A. palmata* is one of the finest of the race, of good habit, dark green leaves, and beautiful yellow flowers; being a spring bloomer it is very desirable.

A. alpina, another early spring-blooming variety, does well on rockwork. It should have thorough drainage. When well established no plant can be more beautiful.

A. sulphurea is very seldom met with; it is not a very attractive plant on account of the paleness of its flowers, yet it is a desirable addition to a collection.

A. japonica alba should be in all collections; *Honorine Jobert*, the gem of all the train, indoors, or out in the border, or in the bed. For autumn decoration no plant can be more beautiful; it will well repay any amount of labour bestowed upon it.

I am inclined to think we have some confusion here about the name. Is not *Anemone japonica alba* and *A. vitifolia* confounded with *Honorine Jobert*? I ask information on this point.

There are many others that are worthy of the cultivator's notice; many useful for beds in the early spring, summer, and autumn, and for exhibition as herbaceous plants. And here I would remark that, in my opinion, all herbaceous plants for exhibition should be grown and exhibited in pots to show their habits; nothing in my eyes looks so distressing in an exhibition as a few bundles of half-withered flowers that are often to be seen placed on exhibition tables.—*VERITAS*.

THE YEAR AND ITS LESSONS.

VERY interesting indeed was Mr. Luckhurst's agreeable review. It is always interesting in the great horticultural fraternity to see how one's brethren fare. Many a lesson which the year has left behind must in the nature of things remain hidden; many important facts and observations must have been born only to be buried as it were, lost in the lapse of time, vanished from trusted yet treacherous memories. Mr. Luckhurst's narrative, apart from its inherent value, teaches another lesson—one to be especially commended to the rising generation of gardeners—viz., the point, force, and value of systematic notation. Sailing without chart or compass never made an admiral yet, and never will. The rocks must be noted, the hidden dangers largely marked, as well as the harbours of refuge have prominent entry. These logs carefully treated will be a mine of wealth to those fortunate enough to possess them. If a man of Mr. Luckhurst's evident skill and accomplishments feels their value, and everyone may be certain that he does, what further can be required as to their extreme importance?

Results of practice can never be so well recorded as at the moment of observation. Thoughts will occur just once in a lifetime; note them, or they are for ever lost. In all log-books, besides space for routine entries, there should be a wide margin for results, another still wider for thoughts and observations. This should be regarded as a bank of knowledge to be drawn from and added to in the progress of life. Besides the mere contents of such a register, the habit of entering is in itself no unimportant educator. It will train the mind to quick and correct judgment—to form its estimates as if by intuition; invest it with clearer, stronger, and more determinate powers of comparison; and will lead imperceptibly, yet not less certainly, to a free, easy, natural, yet correct form of expression. There is nothing here but which is of importance to the gardener of the future; and if a man lacks these qualities, and lacks also ambition to attain them, he may more profitably seek another calling. Depend upon it that is good advice. For the best interest of the whole craft—its real welfare as a profession, as well as for individual success, and, this emphatically for the benefit of those it is intended to benefit—the characters and attainments of its representatives must be run in a more highly-finished mould in the future than has sufficed for the past.

But can such men work? Work! with lines leading to

success drawn straight before him, what equal stimulant can he have? Work! it will be work direct to its purpose—not brain and muscle wasted, not a dead loss of vital force, but a real profitable application of energy correctly applied and at a right time to effect a given purpose. That is the only right way for work to be prosperous, and is what is more and more demanded and expected every day. That is the standard to be aimed at and attained, and if it is deemed too high by some they will be in the wrong place in continuing a gardening career. It is one of the greatest mistakes of the day to encourage a youth to blunder on in a garden who has no ambition to excel, no special aptitude to adorn and add honour to an old and honourable craft. Let us seek to improve its status by every possible means to the common advantage of all. A word to the wise is enough.

The correct and careful tabulation of work, thought, observation, and kindred circumstances suggested by Mr. Luckhurst's paper is one great means to recommend, one of the greatest self-aids that can be mentioned to all anticipating a successful career. By lack of this many valuable hints and sterling points of practice slip into the dark past and are dead—lost for ever, instead of being stored as landmarks of usefulness, valuable to the gardening wayfarer and an honour to the man recording them. The public record of points of usefulness always reflect credit on those who advance them; they are evidence of a generous mind, a will to serve and benefit the generation. Churlishness in gardening is happily dying out. The days of secrets belong to a past age, and any instance now-a-days of a man fearing to record practice lest another should be as wise as he, is every year becoming more closely interpreted as "I am poor myself, my man, and have nothing to spare." But an immense mass of useful hints are withheld from the world by a deterring notion that they are too plain and commonplace to merit notice. That is a great delusion. As a rule, plain successes in common things is the most really useful of all information. If a grower can relate a mode whereby he has doubled his crop of Potatoes, the narration redounds more to his honour and is of infinitely greater service than in dabbling in gases and playing at science. All honour to the man who has courage to relate his common practice of common things. To refrain from stating a fact because it is not "great" is an error of judgment, and withal a too common one. Let it not be supposed that a slight estimate is formed of scientific research. No, no. That is a matter pregnant with advantages inestimable, and there are men to evolve philosophical facts who merit a country's gratitude; but practice, simple practice, is an everyday's work and an everyday's want. Mr. Luckhurst has set a worthy example. It is not given to all to treat as he has treated, but all can emulate and hold a share in the mine of knowledge, and share in the noble work of public instruction. The useful lessons dated fifty miles south of London are hereby supplemented by notes from a locality 130 miles north of the metropolis. The first words of the diary are singularly like Mr. Luckhurst's—viz., "Glorious new year's morning, mild and bright." The month closed as it opened, with rooks building and Snowdrops sparkling on the grass. It was remarkably salubrious throughout, the average minimum night temperature being 33°. A dry month. February was much the same at its opening and close, but with sharp frosts in the middle injuring the heads of Snow's Broccoli, but not harming the fruit buds, as they were not forward. "Not forward," with the mildest winter ever known, the mean temperature of December preceding being 41°, seems strange, but the reason is plain. Sap will not move under heat unaccompanied by moisture. It was dry; the buds were late in spite of the mild temperature, and saved. The average mean temperature of the three months—December, January, February, was 39°, but then the average rainfall in the same time was only 1.02, hence vegetation slept. Under showers at the end of February it awoke rapidly, and on March 11th and 12th 15" of frost were registered. Plum and Pear blossom was showing, but escaped injury. April extremely mild, and towards the end hot, on the 25th 82° being registered in the shade 4 feet from the ground. May was not so warm as April by a daily average of 1°. On the 18th of May was a disastrous frost, leaving orchards a blank. Plums and Pears being better set—more forward—than Apples, had a sprinkling of fruit left, but the latter fruit, except in high and dry situations, was almost absolutely killed. Thousands of tons of Apples were prevented by that one night's frost. June a hot and most trying month. From May 23rd to June 22nd only 0.06 of rain fell. Forest

trees flagging and crops exhausted. July, heat tropical, the 20th being the hottest day known here, reaching 91° (corrected thermometer) in the shade. The heat was followed by the most extraordinary hailstorm ever noted. In twenty-five minutes the ground was covered 3 inches deep with hailstones, averaging three-quarters of an inch in diameter, and at the fronts of buildings it was piled by cartloads. Here succeeded a striking phenomenon. The earth was covered by a dense cloud so thick that the surface could not be seen, whilst the line of sight was brilliantly clear. The upper part of men and things could be seen, the lower parts being wrapped in the earth cloud. It was a weird emotional spectacle, but easily accounted for. The bright sun above was almost overpowering, and the evaporation from the earth consequently great, and would have been invisible but for the hail-covered surface. This cooled the lower stratum of air to the condensing point, rendering the uprising moisture visible like one's breath on a winter's day. Such fruit as the frost left was ruined by this terrible storm. Peas and Beans were cut off the rows, flowers annihilated, and broad-leafed plants riddled as with shot. It was a desolate scene ever to be remembered. The storm track was not much more than a mile wide. August brought showers, and the year was genial until November 11th, when Dahlias were killed at last. Snow fell on the 1st of December, and the ground remains covered to this time, the 24th.

It will be seen that the summer portion of the year has been most trying to the gardener. As an instance of the drought in the growing months may be stated the fact that from the end of March to the 22nd of July only 3.24 inches of rain fell here. Is not that unparalleled in Britain? But what of the crops? First, the land is light, but there has been no scarcity of vegetables, except a few days following the storm. The character of the land was known. The district liability to drought was remembered. The deliquescent nature of salt was recognised. It was used freely. No ground was half dug. It was either worked deeply or mulched (amongst fruits) with manure, and left undug. Peas and nearly all vegetables were not only sown on trenched ground, but sown in trenches. Each crop was deluged once a-week, and an hour or so after the wet surface covered with half an inch of dust to arrest evaporation. This, with all the mulching possible, sustained us. It was feeling the nature of the soil, anticipating the liabilities of drought, knowing the means of mitigating its effects, and applying them—it would have been no use without the application—this pulled us through. Thus closed the year, the ninth and last, of my present sphere of labour—a period in which even a whisper of complaint has not been uttered, and which, in the words of an esteemed employer, "closes an engagement in all respects so successful and satisfactory." That is the end to work for, to be attained. It can only be accomplished by, as it were, a combination of effort. There must be a consideration of weather characteristics, of site, of soil. There must be reading, writing, noting, thinking, working, and above all, the special and particular requirements of an employer must ever be kept in mind. That is the keynote. Get what pleases him. Never mind what others have or think. The right of an employer and the duties of an *employé* are interbound. We must acknowledge that right, and admit the duty. It is the only road to confidence and success. It must be remembered that none of the conditions must stand alone. Reading is no use without thinking, thinking without noting, noting without working, and working itself will never hit the mark unless steadily directed to a given and specially required end. Combine the conditions, and you command success. This is a lesson which many years have taught to be practical, and the passing one proved as trustworthy and recommendable.—J. WRIGHT.

THE GOLDEN CHAMPION GRAPE.

This variety of the Grape Vine caused something like disappointment soon after its introduction, but it is nevertheless a very extraordinary fruit; and its fine appearance, great size of berry, as well as of bunch, and its by no means inferior quality when well grown, will long insure its admittance into most collections. The fruit, however, will not keep well for any considerable time after it has become ripe; consequently it is perhaps unadvisable to associate it with such late-keeping varieties as the Alicante and the Lady Downe's, &c. Its great drawback, however, is its unfortunate propensity to become spotted as soon or even before it becomes quite ripe. It is not, however, of the merits, or demerits of this remark-

able fruit that I am about to write, but merely to narrate what appears to me to be a very remarkable circumstance in connection with it, which is as follows. Some twenty or more years since a house here was planted with the variety of Grape known as the West's St. Peters, and some six or seven years afterwards several of these Vines were grafted with the Black Alicante and the Lady Downe's varieties; and some time after this

| D. Golden Champion rod which was removed. | |

one Vine was regrafted with three distinct varieties—viz., Trebbiano, Golden Champion, and Mrs. Pince, each variety forming distinct rods which were annually pruned according to the spurring system, and for several years each rod continued to produce its respective kind of fruit.

Last January, however, when the Vines were pruned on account of the fruit of the Golden Champion variety not keep-

ing like the other late sorts which the house contained, the rod was cut out altogether at a point some inch or two below its union with the Alicante variety, on which it had been grafted as is shown in the accompanying sketch, leaving only the rods of the Trebbiano and the Mrs. Pince varieties, both of which produced their respective kinds of fruit during the present season as usual, with the exception of the Trebbiano rod, which produced upon one spur a bunch of the true Golden Champion variety—true as to size and form of berry and of bunch, colour, flavour, and even to the characteristic spot. This bunch is produced about the middle of the rod, or about 8 feet from where it is united to the Alicante variety, so that several bunches of the true or ordinary Trebbiano variety are produced below as well as above this very unlooked-for production, which appears difficult to account for, although it naturally suggests this question—viz., Can it be ascribed to the circumstance of the Golden Champion variety having for several years grown upon the same stock as the rod of the Trebbiano Vine which has produced the bunch in question? And should this be admitted, it certainly appears strange that this result should not have been developed during the several years when the rod of the Golden Champion sort actually existed upon the stock. It would doubtless be interesting to know if anything similar to this has ever come under the notice of others of your many readers and correspondents, whether in the case of the Grape Vine or in any other kinds of fruit trees. It might also be interesting to know, if possible, something of the origin of the Golden Champion Grape, whether it was the result of a sport, and if so, from what variety; or, if a seedling, from what sort was it raised? Possibly Mr. Thomson may kindly furnish this information.—P. GRIEVE, *Culford, Bury St. Edmunds.*

AURICULAS.

It appears that southern growers have, some of them, had cause to fear that chances of a strong spring bloom of Auriculas stand seriously affected by the profuse show of trusses that came forward in the mild sunny autumn.

Because of "D., Deal's," notes upon this painful subject, in which he says that perhaps half his blooming plants have sent up autumn trusses, I went down to my Auriculas to see how far facts would bear out my impression, that in a very tempting season they had not been misled into much autumn blooming. I took for sample the department that contains the thick cream of the collection. Standing here in rows of seven, there are 231 picked plants, all the full specimens I possess of such delectables as Smiling Beauty, Taylor's Glory, Page's Champion, Col. Taylor, Prince of Greens, Lancashire Hero, George Lightbody, and many others. Of this lot only sixteen have sent up autumn trusses, and some of these came up in so good time, that the autumn stems are yellow and a new heart formed again. I do not think, among the other hundreds of large and small, I could count-out twenty more delinquents, especially if I may omit a few naturally constant offenders.

The plants here in their winter house are accessible under all the snow and ice, an advantage not always to be enjoyed when Auriculas are wintered in frames. Although cold at that time does them no harm, their anxious owner may often "catch it" by exposure at his frames; so a simple well-ventilated house for them through the winter and blooming season is no little and no useless luxury. There may be days and days in the early flowering time when one could but stand in the "cauld blast," shivering at the boxed-up beauties in the frames, but with an inside place the rougher that things outside may be the sweeter the contrast.

My plants are always repotted immediately after blooming—i.e., during May, with exception of those entrusted with the work of seed-bearing, and none of the dismal predictions made to me have ever come true, that I shall thereby have everything in a blaze in autumn. Cool summer treatment, which is no doubt more difficult to afford in the south, is, I believe, a most important point in the culture of this flower. I should not feel content with only shading Auriculas through the summer time in a sunny aspect, for shading is not like shade.

The plants with their large susceptible foliage that looks so spent and unmindful of appearances in the hot months, delight in the more equable temperature, the longer dews, and the cool, clear, uninterrupted light of a north aspect. I agree with "D., Deal," that the cooler atmosphere of the north and our earlier autumnal frosts are all in favour of the Auricula

in keeping the excitable new heart quiet until the spring. In fact, when the plants are in seasonable condition in well-aired quarters, free from damp and dry overhead, there is no kinder winter nurse than rough-handed Jack Frost for this hardy pet. Mine are frozen in their pots now, and are welcome to be so for a good month longer if they like, and I was very glad when the white frosts came with their lullaby after a long autumnal wakefulness.

There will be no more rising now of blooming-stems until the magic month (for Auriculas), of March; and if I may propose a dry toast towards the success and fine character of next year's bloom, I would say, May we all have among our Christmas pleasures that significant one to Auricula growers, of seeing a few snug heads of pips safe over the autumn distemper left visible, but deep and stalkless yet in the hearts of our best green edges.—F. D. HORNER, *Kirkby Malzeard, Ripon.*

NEW BOOK.

Roses in Pots, &c. By WILLIAM PAUL, F.R.H.S. Fourth Edition.

WE welcome with much satisfaction a fourth edition of Mr. W. Paul's "Observations on the Cultivation of Roses in Pots." "The name of Paul," it has been happily remarked, "is almost as intimately associated with the Rose as that of Stephenson with railways, or Cobden with free trade." And this is not all; the Rose must gratefully acknowledge a double debt of gratitude to Mr. W. Paul, of Waltham. The promise in that graceful ode has exactly been fulfilled by him—

"I'll make thee famous with my pen,
And glorious with my sword."

Only the sword has been turned into a ploughshare, or more exactly a garden spade. No man has done more, or indeed so much, for the Rose both by example and precept. There is no higher living authority. But this before us is not merely a book about Roses. Everybody thinks he can grow Roses—at least until he tries; but even everybody does not think he can grow pot Roses. Those glorious pyramids of perfection (one such is pictured most charmingly at page 89) are entirely out of the reach of ordinary gardens—the owners might as well expect to be able to grow their own Pine Apples! But still, in this age of luxury, with the amount of glass and gardeners now to be seen in every direction, it is marvellous that more should not be made of this queen of flowers in the very most fascinating of all the forms in which she presents herself. It is a field into which amateurs have as yet hardly ventured. The names of exhibitors of good pot Roses may still almost be counted-up on one hand; while Mr. W. Paul—like that Welshman in the days of the Deluge, of too old a family to associate with Noah, and who therefore had an ark of his own—Mr. Paul, as all know, gives the public a special most delightful spring exhibition of pot Roses.

From the writings of Mr. Paul it is sufficiently evident that, where proper appliances exist, the cultivation of even exhibition specimens need present to careful cultivators no insuperable difficulties. In his preliminary remarks here he tells us how the idea of cultivating pot Roses for exhibition originated—namely, in "prizes offered from the Horticultural Society of London," and how the thing at first hung fire. He has now the satisfaction of telling us in the preface to this fourth edition: "This system of cultivation has created some stir among the lovers of Roses; and from the decided superiority of the specimens exhibited during the present year it would appear that Roses are well adapted for pot plants, and are likely to engage the attention of numerous plant-cultivators." That which is merely here alluded to may well be reproduced from one of the descriptions in the journals of the day. The date which delightful old Jacob (see page 81) wrote up in mysterious symbolage, "Syd., May 8th," has its place undeniably in many grateful memories. We will just recall the scene that May morning at the Crystal Palace:—"Everywhere the eye rested upon banks of glorious flowers, which made the atmosphere heavy with fragrance." "One hardly knew which to admire most, the magnificence of the plants or the taste displayed." As we then took occasion to remark in "our Journal," Mr. W. Paul was to be congratulated "on the opportune time which he selected for his exhibition, which enabled His Imperial Majesty the Czar to see what English-grown Roses really are." It was remarked at the time that the Emperor Alexander "showed a strong inclination to enjoy it longer than the programme marked out for him allowed of." Perhaps, if there was one thing wanting, it was that our other

imperial visitor was not in time for it. Assuredly it would have had a special notice in the Shah's journal, unless, indeed, he had thought it right to imitate the founder of his faith and abstain from the visit, on the same principle as Mahomet, who is said to have refused even to look down upon Damascus, saying that only one paradise was allotted to mortals, and that he, for his part, would not enter upon his here!

In this little work of ninety-one pages will be found every direction that can possibly be required. The explanations are much assisted by well-executed woodcuts. Though a book of now some standing, it is so well written-up to the present day that we observe in the Rose catalogue even some of the coming Roses for the spring of 1875, notably those two from Waltham, with regard to which we have had the gratifying announcement that Mr. W. Paul considers them the finest he has ever been able to introduce to the public, the Queen of Waltham and the Star of Waltham. In the closing portion, to which we have already alluded, will be found a most amusing and yet strictly scientific autobiography, written by one of those plants of Mr. Paul's which have Royalty for their patrons and admirers, and illustrated as it goes along with some very effective and instructive little drawings.

We now refer shortly to the general contents. Mr. Paul begins by affirming that to have Roses all the year round is quite practicable if we grow them in pots. "Three sets of plants (only) are requisite to accomplish this. The first, which are grown out of doors or in a cold pit, will flower from May till November; the second, which are retarded, will flower from November till February; and the third, which are forced, from February till June." He proceeds then to tell how to retard and how to force. There are some excellent remarks upon choice of varieties, and on the characteristics of those best suited for pot culture. These he defines as—1, Elegance of Habit; 2, Contrast of Colour; 3, Abundance of Bloom; 4, Form or Outline; 5, Duration; and 6, Sweetness; while the quality of duration is explained as holding "the flowers in perfection for some days—a most necessary thing, since to obtain a number of flowers on one plant in all the various stages of bloom at a given time is one great point the cultivator of Roses in pots for exhibition should never lose sight of."

Lists of the best climbing and forcing varieties are supplied with a fullness which leaves nothing to be desired; while at the same time we have laid down that most important and often overlooked principle in Rose-growing, "that it is better to have one first-rate Rose growing in two positions, than a greater variety comprising kinds of inferior merit." Without some such guidance, as that which is here offered, the first few years of an exhibitor are really mainly taken up with finding out what will not answer, and what to get rid of.

On page 38 we have a list of yellow Roses. What is a yellow Rose? has often been queried. Here we are told by the Royal Botanic Society, and the list has been corrected so as to take in those of the present day.

The enemies, again, of pot Roses are enumerated. We are forearmed against the caterpillar: "When the buds first break, and continually after, the plants should be keenly sought over to destroy the grub and caterpillar, which travel from shoot to shoot, eating-out the growing points. Some of these are mere threads in appearance, and can scarcely be detected till some mischief is done. A finely-pointed knife or a large needle is the best instrument for this purpose." The aphid or green fly is next discussed, and here we cannot forbear from quoting wholesale from the autobiography. It is only fair to begin *ab ovo*. The favourite of Royalty begins life as "a cutting!"—

"In about eight days the juices exuding from the top and bottom of my stem had formed a callus, and a few days later white porous roots began to form, with sponge-like points, that sucked up the moisture from the soil."

A few months elapse, and now the cutting is in the forcing house, a sprightly young plant.

"Everything around me was so neat and comfortable that I began to think I had arrived at the summit of plant happiness, when suddenly there came—from where I know not—a minute insect, the colour of my leaf, which caused me great pain and annoyance. At first I looked upon her as a mere visitor, attracted hither by the warmth and comfort of my dwelling; and though it was irritating enough to have her stalking over the still delicate membrane of my leaf, this I might have borne on account of good nature. But alas! I soon found that not only had she made up her mind to dwell on my leaves, but also to live on my juices. Puncture after puncture was made with

rapid succession, and soon a host of young ones rose to join in the attack. A few days only had elapsed since the appearance of the first of this numerous race; but their voracity was so great that my roots could not meet the demand thus made upon them. In vain I twisted my leaves; the more languid the supply the more violently did they suck my juices, and my health began to decline; when one day the door opened, and John, whom I had not seen for some time, came hobbling in with a stick. With a single glance of the eye he saw how the case stood, and forgetting his rheumatism, he dropped his crutch, and hopped out of the house, shouting, "Jacob—green fly—tobacco!"

One other extract must be made, for it bears upon one of the special questions of the day, which has more than once been hotly contested in these columns, and that is the comparative merits and demerits of the Manetti. That delightful old John is discussing it with a younger gardener. It is not hard to gather from their conversation what is our author's opinion:—

"JOHN.—Does it not grow well?"

"SIMON.—Yes, too well. It grows so well that there is now nothing but itself in the way of Roses left in the garden."

"JOHN.—But are not the young plants fine?"

"SIMON.—Yes; fine the first year, but seldom afterwards. With us ground shoots spring up in quicker succession, and ten times more numerous, than from the Dog Rose; and no amount of watchfulness on my part could prevent the exhaustion and death of the sorts budded on it."

"JOHN.—The stock has been successful, then, if the sorts budded on it have failed? But do they not say it is more excitable than any other stock, and that Roses break and blossom earlier on it?"

"SIMON.—Excitable! yes. Last spring my Roses broke a fortnight earlier than other people's, and were frosted in consequence, while theirs remained unscathed. But if you would like to try it I will send you some."

"JOHN.—Thank you. I have already tried it. I wanted a confirmation or contradiction of my conclusions, and your opinions are in exact coincidence with my own. It may do well under special circumstances, but it is not the stock for general use."

With this we unwillingly take our leave of a most agreeable mixture of the *utile* with the *dulce*. A famous physician, when asked by his patients what course they were to pursue after leaving him, is said to have answered invariably, "Buy my book!" We would say the same to all who have thus far accompanied us, There is no better two-shillings' worth—Buy the book!

THE LUCY GRIEVE PEAR.

It happened very long ago,
How long?—we scarcely seem to know—

A fair young child, in joyous glee,
Pluck'd with daring little hand

A ripe Pear from a tree;

And ate the mellow fruit she chose

With all the zest which childhood knows,

But marvelled in its inmost core

Some dark brown pips to see;

And marvelled more to hear it told

That each small pip, so plump and bold,

Might yet become a tree.

Then thoughtfully she pondered long

How this thing could be so,

And lastly in a pit of earth

A tiny seed did sow.

That seed became a living plant,

And claimed her willing care,

While promises were kindly made

With friends its future fruit to share.

In time the plant became a tree,

With foliage bright and fair—

The child a merry little maid,

In favour everywhere.

Affection cherished still the tree,

Which cold and storm could brave,

But long before it bore a fruit

The maid was in her grave.

And when at last it ripened fruit,

And they who well do know,

Declare, on England's fertile soil

No richer e'er did grow;

And say how that a fruit so fair

Its raiser's name should bear,

And be hereafter always known

As little Lucy's Pear.

GARDEN LABELS.—I have seen the different letters in "our Journal" respecting garden labels, and amongst others the suggestion respecting China labels (the names being printed by the manufacturers). It struck me, however, that enamelled iron, such as you see now at most railway stations in the

shape of advertisements, &c., would be far preferable, as it would not be likely to break, and I should fancy it would stand any amount of weather.—WALTER W. BURNETT.

EARTHENWARE COPING.

Its advantages are so evident that it seems to require no notes from me, combining as it does a good permanent coping, fruit-protector, and gutter to carry off the rain. A slight slope would, of course, be necessary, and a cast-iron shouldered pipe, which I have indicated by dotted lines in the sketch, could receive the water, and be carried down the wall into a sunken tank. I should have the coping made of two sizes—viz., 2 feet 2 inches for a 9-inch wall, and 2 feet 6 inches for one of 14 inches. I fancy that it might be advisable, after fixing, to

Fig. 103.

paint the coping on the upper side and ends with "silicate zopissa," or some other compound, to prevent the rain entering the porous material, thereby giving a handle to the frost. I should be glad, if any brickmakers (at whose service I place it) adopt it, if they would name it the "Elliott Coping."—J. E.

DO VARIETIES WEAR OUT, OR TEND TO WEAR OUT?

By PROFESSOR ASA GRAY.

This question has been argued from time to time for more than half a century, and is far from being settled yet. Indeed, it is not to be settled either way so easily as is sometimes thought. The result of a prolonged and rather lively discussion of the topic about forty years ago in England, in which Lindley bore a leading part on the negative side, was, if we rightly remember, that the nays had the best of the argument. The deniers could fairly well explain away the facts adduced by the other side, and evade the force of the reasons then assigned to prove that varieties were bound to die out in the course of time. But if the case were fully re-argued now, it is by no means certain that the nays would win it. The most they could expect would be the Scotch verdict, "not proven." And this not because much, if any, additional evidence of the actual wearing-out of any variety has turned up since, but because a presumption has been raised under which the evidence would take a bias the other way. There is now in the minds of scientific men some reason to expect that certain varieties would die out in the long run, and this might have an important influence upon the interpretation of the facts that would be brought forward. Curiously enough, however, the recent discussions to which our attention has been called seem on both sides to have overlooked this matter.

Some varieties may disappear or deteriorate, but yet not wear out—not come to an end from any inherent cause. One might even say, the younger they are the less chance of survival unless well cared for. They may be smothered out by the adverse force of mere superior numbers; they are even more likely to be bred out of existence by unprevented cross-fertilisation, or to disappear from mere change of fashion. The question, however, is not so much about reversion to an ancestral state or the falling-off of a high-bred stock into an

inferior condition. Of such cases it is enough to say that when a variety or strain of animal or vegetable is led up to unusual fecundity or size or product of any organ, for our good, and not for the good of the plant or animal itself, it can be kept so only by high feeding and exceptional care; and that with high feeding and artificial appliances come vastly increased liability to disease, which may practically annihilate the race. But then the race, like the bursted boiler, could not be said to wear out; while if left to ordinary conditions, and the race allowed to degenerate back into a more natural if less useful state, its hold on life would evidently be increased rather than diminished.

As to natural varieties or races under normal conditions sexually propagated, it could readily be shown that they are neither more nor less likely to disappear from any inherent cause than the species from which they originated, upon which, indeed, only vague conjectures can be offered. The matter actually under discussion concerns cultivated or domesticated varieties only.

First, will races propagated by seed, being so fixed that they come true to seed, and purely bred (not crossed with any other sort), continue so indefinitely, or will they run out in time—not die out, perhaps, but lose their distinguishing characters? Upon this, all we are able to say is that we know no reason why they should wear out or deteriorate from any inherent cause. The transient existence or the deterioration and disappearance of many such races are sufficiently accounted for otherwise. As in the case of extraordinarily exuberant varieties, such as mammoth fruits or roots, by increased liability to disease, already adverted to, or by the failure of the high feeding they demand. A common cause, in ordinary cases, is cross-breeding through the agency of wind or insects, which is difficult to guard against. Or they go out of fashion and are superseded by others thought to be better, and so the old ones disappear.

Or finally, they may revert to an ancestral form. As offspring tends to resemble grand-parents almost as much as parents, and as a line of close-bred ancestry is generally prepotent, so newly originated varieties have always a tendency to reversion. This is pretty sure to show itself in some of the progeny of the earlier generations, and the breeder has to guard against it by rigid selection. But the older the variety is—that is, the longer the series of generations in which it has come true from seed—the less the chance of reversion: for now, to be like the immediate parents, is also to be like a long line of ancestry; and so all the influences concerned—that is, both parental and ancestral heritability—pull in one and the same direction. So, since the older a race is the more reason it has to continue true, the presumption of the unlimited permanence of old races is very strong.

Of course the race itself may give off new varieties; but that is no interference with the vitality of the original stock. If some of the new varieties supplant the old, that will not be because the unvaried stock is worn out or decrepid with age, but because in wild nature the newer forms are better adapted to the surroundings, or, under man's care, better adapted to his wants or fancies.

The second question, and the one upon which the discussion about the wearing-out of varieties generally turns, is, Will varieties propagated from buds—i.e., by division, grafts, bulbs, tubers and the like, necessarily deteriorate and die out? First, Do they die out as a matter of fact? Upon this, the testimony has all along been conflicting. Andrew Knight was sure that they do, and there could hardly be a more trustworthy witness.

"The fact," he says, fifty years ago, "that certain varieties of some species of fruit which have been long cultivated cannot now be made to grow in the same soils and under the same mode of management which was a century ago perfectly successful, is placed beyond the reach of controversy. Every experiment which seemed to afford the slightest prospect of success was tried by myself and others to propagate the old varieties of the Apple and Pear which formerly constituted the orchards of Herefordshire, without a single healthy or efficient tree having been obtained; and I believe all attempts to propagate these varieties have, during some years, wholly ceased to be made."

To this it was replied, in that and the next generation, that cultivated Vines have been transmitted by perpetual division from the time of the Romans, and that several of the sorts, still prized and prolific, are well identified, among them the ancient Græcula, considered to be the modern Corinth or Currant Grape, which has immemorially been seedless; that

the old Nonpareil Apple was known in the time of Queen Elizabeth; that the White Beurré Pears of France have been propagated from the earliest times; and that Golden Pippins, St. Michael Pears, and others said to have run out, were still to be had in good condition.

Coming down to the present year, a glance through the proceedings of pomological societies, and the debates of farmers' clubs, brings out the same difference of opinion. The testimony is nearly equally divided. Perhaps the larger number speak of the deterioration and failure of particular old sorts; but where the question turns on "wearing out," the positive evidence of vigorous trees and sound fruits is the most telling. A little positive testimony outweighs a good deal of negative. This cannot readily be explained away, while the failures may be, by exhaustion of soil, incoming of disease, or alteration of climate or circumstances. On the other hand, it may be urged that, if a variety of this sort is fated to become decrepid and die out, it is not bound to die out all at once, and everywhere at the same time. It would be expected first to give way wherever it is weakest, from whatever cause. This consideration has an important bearing upon the final question—Are old varieties of this kind on the way to die out on account of their age or any inherent limit of vitality?

Here again Mr. Knight took an extreme view. In his essay in the "Philosophical Transactions," published in the year 1810, he propounded the theory not merely of a natural limit to varieties from grafts and cuttings, but even that they would not survive the natural term of the life of the seedling tree from which they were originally taken. Whatever may have been his view of the natural term of the life of a tree, and of a cutting being merely a part of the individual that produced it, there is no doubt that he laid himself open to the effective replies which were made from all sides at the time, and have lost none of their force since. Weeping Willows, Bread Fruits, Bananas, Sugar-cane, Tiger Lilies, Jerusalem Artichokes, and the like, have been propagated for a long while in this way, without evident decadence.

Moreover, the analogy upon which his hypothesis is founded will not hold. Whether or not one adopts the present writer's conception that individuality is not actually reached or maintained in the vegetable world, it is clear enough that a common plant or tree is not an individual in the sense that a horse or man, or any one of the higher animals is, that it is an individual only in the sense that a branching zoophyte or mass of coral is. *Solvitur crescendo*. The tree and the branch equally demonstrate that they are not individuals, by being divided with impunity and advantage, with no loss of life, but much increase. It looks odd enough to see a writer like Mr. Sisley reproducing the old hypothesis in so bare a form as this:—"I am prepared to maintain that varieties are individuals, and that as they are born they must die, like all other individuals." "We know that Oaks, Sequoias, and other trees live several centuries, but how many we do not exactly know. But that they must die, no one in his senses will dispute." Now, what people in their senses do dispute is, not that the tree will die, but that other trees, established from cuttings of it, will die with it?

But does it follow from all this that non-sexually propagated varieties are endowed with the same power of unlimited duration that are possessed by varieties and species propagated sexually—i.e., by seed? Those who think so jump too soon at their conclusion. For, as to the facts, it is not enough to point out the diseases, or the trouble in the soil, or the atmosphere to which certain old fruits are succumbing, nor to prove that a parasitic fungus (*Peronospora infestans*) is what is the matter with Potatoes. For how else would constitutional debility, if such there be, more naturally manifest itself than in such increased liability or diminished resistance to such attacks? And if you say that, anyhow, such varieties do not die of old age—meaning that each individual attacked does not die of old age, but of manifest disease—it may be asked in return, what individual man ever dies of old age in any other sense than of a similar inability to resist invasions which in earlier years would have produced no noticeable effect? Aged people die of a slight cold or a slight accident; but the inevitable weakness that attends old age is what makes these slight attacks fatal.

Finally, there is a philosophical argument which tells strongly for some limitation of the duration of non-sexually-propagated forms, one that probably Knight never thought of, but which we should not have expected recent writers to overlook. When Mr. Darwin announced the principle that cross-fertilisation

between the individuals of a species is the plan of nature, and is practically so universal that it fairly sustains his inference that no hermaphrodite species continually self-fertilised would continue to exist, he made it clear to all who apprehend and receive the principle that a series of plants propagated by buds only must have a weaker hold of life than a series reproduced by seed. For the former is the closest possible kind of close breeding. Upon this ground such varieties may be expected ultimately to die out.

The conclusion of the matter from the scientific point of view is, that sexually-propagated varieties or races, although liable to disappear through change, need not be expected to wear out, and there is no proof that they do; also, that non-sexually-propagated varieties, though not liable to change, may theoretically be expected to wear out, but to be a very long time about it.—(*New York Tribune*.)

THE SNOWBERRIES.

BOTANISTS and gardeners alike have got things a little mixed in regard to these plants. Dr. Asa Gray has recently contributed a paper to the Linnean Society's Journal, clearing up some matters in relation to the botanical question; and we may as well say a few words as to the other. The common Red Snowberry of our gardens—the Indian Currant of some localities—is usually referred to in our nursery catalogues as *Symphoria glomerata*. This is Pursh's name. The generally accepted name is that of Michaux, which is *Symphoricarpos vulgaris*. It is rather common in shrubberies, but not so much as it deserves to be. Dr. Gray makes eight species; but this is the only one with red fruit. Dr. Gray, however, describes a new species found in Nevada, with flowers half an inch long, naming it *S. longiflorus*, the fruit of which he has not seen. It is probably white. The other species—common in gardens—is the White Snowberry, and is *S. racemosus*, also of Michaux. These two are the only ones that seem so far to have got into cultivation. There is another species allied to the White Snowberry, which grows west of the Mississippi, and east of the Rocky Mountains, which is a stronger grower than that in our gardens, and is worth introducing. This is *S. occidentalis* of R. Brown. There is another very pretty little bushy species in Colorado, which most of us who have collected have named in our herbariums *S. montanus*. This Dr. Gray now refers to one previously named by him in Wright's "Plants of Texas," *S. rotundifolius*. The true *S. montanus* is a Mexican species. Three supposed Mexican ones, including *S. montanus*, are united under the one name *S. microphyllus*. The other species not yet in cultivation is *S. mollis* of Nuttall, in California, and *S. oreophilus*, which also has been confused with *S. rotundifolius*, as *S. montanus* in Colorado herbariums. In the paper Dr. Gray has some interesting observations on the nature of the fruit, showing that it is not a berry as some botanists believe, but a species of drupe.—(*American Gardeners' Monthly*.)

ONCIDIUM LEUCOCHILUM.

THE subject of our present illustration is a member of one of the largest families of Orchidaceous plants, comprising as it does several hundred species and varieties, the majority of which are deserving a place in the amateur's collection. As a genus, *Oncidium* is nearly allied to *Odontoglossum*, but differs principally in the shape and form of the labellum or lip.

The prevailing colour in the flowers of the various species and varieties of *Oncidium* is some shade of yellow, but there are some striking exceptions to this rule, and *O. leucochilum*, or the White-lipped *Oncidium*, is one of them. *Oncidiums* have a wide geographical range, for whilst some are found at elevations ranging from 7 to 10,000 feet, others descend to low elevations and enjoy tropical heat, and many are found scattered through various parts of Brazil and the West Indian islands.

Oncidium leucochilum was first introduced to this country some forty years ago from the mountain regions of Guatemala, and I have invariably found it succeed best with me under cool treatment; but although this species has grown satisfactorily with me, I saw it some few years since infinitely finer in the then rich collection of the late Thomas Dawson, Esq., of Meadow Bank, under the management of Mr. Anderson. It thrives admirably in the company of such plants as *Odontoglossum grande*.

In potting, use good rough fibrous peat and sphagnum

moss in about equal parts, drain the pots well, and elevate the base of the plant well above the rim of the pot, for although this species delights in an abundant supply of water, it must upon no account be allowed to stagnate about the roots. The

Fig. 166.—*ONCIDIUM LEUCOCHILUM*.

pseudobulbs are large, more or less corrugated, somewhat ovate and dark green, as also are the large and ample leaves. The flowers are produced during autumn usually, although I have seen the species in bloom during early summer. The spike is long and much branched, bearing a profusion of its bright and attractive flowers, which are in the sepals and petals greenish yellow, transversely barred with blackish brown, whilst the large lip is pure white. The blooms last a long time when cut and placed in water, and they produce a

chaste and pleasing effect when used for the embellishment of a lady's hair.—*EXPERTO CREDE*.

THE BEAUTIFUL AND USEFUL INSECTS OF OUR GARDENS.—No. 28.

A curious fact it is, seemingly of the nature of a paradox, that many of the smaller creatures which, from their size,

might be thought less exposed to dangers than larger species of animals, keep themselves carefully concealed from view during a great part or the whole of their life. Walking through lanes, woods, or fields, a very slight amount of observation acquaints us with what quadrupeds or birds may be about, but it needs pains and trouble to find out the insects. So it is also, in a measure, with regard to the habitants of the garden, where if, as it may be, there is a smaller average of insects when the ground is properly looked after, those that are present are well up in the art of hiding. This may indeed be truly said both of our friends and our foes, the former also very frequently displaying much caution, not so much from dread of man as from an instinct leading them to endeavour to surprise their prey. Our most conspicuous friends, of course, are the various flower-fertilisers, of some of which we have spoken, and their habits necessitate their exhibiting themselves, oft-times to the advantage of birds and predacious insects.

The Drowsy Dor (*Geotrupes stercorarius*), called by several English appellations, one rather contradictory to the first given—namely, the "Flying Watchman," if not always seen is heard and felt, as it has a particular fancy for knocking itself wildly against by-passers at the hour of eve, thereby gaining their anathemas. In the day we not uncommonly see it by roadsides, apparently, one would think, intent upon suicide from the reckless way in which it crawls along places where it is likely to be stepped upon. The truth is, perhaps, that from most birds these insects deem themselves secure (if they think at all), through their dull colours and horny armour, and yet there are birds that seize and break them up. The sight of a Dor the other morning toiling over a piece of garden ground freshly manured, not like Atlas with the world on his back, but with a flat mass of the substance, which hid the beetle completely, and presented the odd sight of an inanimate object moving, seemingly without anyone impelling it, reminded me that the unpleasant-looking stercoraceous beetles are useful as disintegrators or decomposers of manure. They ply their trade in more ways than one according to circumstances; and though they eagerly pounce upon freshly-dropped dung, and adapt it to the uses of their progeny, the Dors also visit dried manure, and no doubt help to bring about chemical changes in it, rendering it nutritive to the soil. Foreign species, as shown in our illustration, form balls or pellets of dung, and roll these in concert—a habit reported of our own species of *Geotrupes*, but not confirmed. Their ordinary mode is to drive burrows or tunnels under the manure, carrying down the substance, and depositing eggs therein. Occasionally, like my acquaintance of the other morning, the beetles carry or push masses of dung to a spot where they wish to burrow for some reason best known to themselves. It is needless to describe a beetle familiar to most residents in the country. One of its peculiarities is to be much infested with brown parasites, which cling determinedly to the under side. On the earth the Dor moves clumsily; as Mr. Staveley says, "It occasionally stops to give one leg or other a kind of weak flourish in the air, like an old gentleman talking to himself, and suiting the action to the word." This may be an experimental process just to see that his limbs are all right for some effort of strength. That the beetle has really plenty of muscle we can easily know by laying hold of it. The larva life probably lasts more than one season; the whitish, rather flabby grub when unearthed by the gardener is likely enough to be taken for the injurious grub of the common cockchafer.

Somewhat like the Dor beetles in habit are the smaller species we call the "Mimic" beetles, because on any slight alarm the individuals at once pretend to be dead, and as they lie prostrate on the ground they might be passed over as tiny black pebbles. They are not singular, however, in this habit, as many beetles feign death or insensibility, with some amount of artifice too. Thus the common Pill Beetle (*Byrrhus pilula*), is actually formed, as we might say, to be a mimic. The legs slide into grooves under the body, and hide away like the joints of a portable easel, while the head is hidden under the thorax. The body also being downy accumulates a little dust during the beetle's journeys hither and thither; so that altogether the resemblance of this insect to a small stone is very close, it cannot be asserted to be so much like a pill or bolus. Returning to the Histeridæ, familiarly called the "Mimics," it is to be particularly noticed that these beetles have such hard

Fig. 167.—THE SACRED BEETLE (*Ateuchus sacer*).

wing-cases as to turn the point of an ordinary pin. Some are rather handsome, such as the Four-spot Mimic (*H. quadrimaculatus*), with steely-black elytra, a reddish marginal line, and a blotch of red on each elytron or wing-case. Though small in size, only a few lines in length mostly, the Histeridæ do service through their being numerous, and they not only resort to manure but help to dispose of small dead animals. They are provided with ample wings, of much service to creatures whose habits, like those of the vultures, require that they should be able to proceed rapidly from place to place. The larvæ of these beetles are slender, whitish, and wormlike, with six not very obvious legs. The tail in several of the species has a forked appendage.

There is a small beetle so little known to most people that it has got no English name, which deserves much encouragement if one knew how to give it. This is scientifically designated *Drilus flavescens*, and is related to the glow-worm. Though not rare it is hard to find, but on examining a male specimen we perceive it is not devoid of beauty, being marked with yellow, brown, and black; the antennæ are also most delicately fringed. The females are wingless, long-bodied, and have very small heads, yet armed with very sharp mandibles. This sex is much more difficult to detect than is the male *Drilus*, and it is really not improbable that, even by entomologists, it is passed over as a grub. The special business

of *Drilus flavescens* is the destruction of slugs and snails. According to Mr. Wood its favourite food is the familiar garden species called *Helix nemoralis*. Possibly the matured insects attack these molluscs, but it is to the larvæ we are chiefly indebted. These larvæ are flat, of a pale brown colour, and with two ridges down the back, composed of small protuberances, each tufted with hair, which probably serve to shield the larvæ from some parasitic enemies. They cannot need protection from the weather generally, as much of their life is passed within the shells of snails, and within these they always hide when changing their skins. One of the most curious features displayed by this larva is a tail feature, so to speak, somewhat resembling the telescopic process which adorns the larva of the glow-worm. In the *Drilus* it is more like a lobe, pretty strong and flexible; and what is remarkable, the larva is supposed to attack snails by backing into them, a proceeding certainly not agreeable to the molluscan creature, which having no defensive weapon can do nothing but eject slime, and this cannot annoy the tail of the *Drilus* larva, though it might be unpleasant to its head. Having forced its way into the shell the larva eats-up the proper tenant at its leisure. Unlike most of the larvæ of beetles, that of *D. flavescens* has a number of short legs, which help it to hold on firmly in its slimy abode.

Allied to the last is the group of beetles we call the Telephori, nearly all soft-bodied in the beetle condition, and yet connected by their structure with the hard-bodied "Skip-jacks" of the Elater division, amongst which we have the terrible pest the "Wireworm." The Telephori are better known, perhaps, to children than to the majority of adults, as it is a favourite amusement with juveniles to watch these on the flowers of the garden, the reddish-yellow species being saluted as "soldiers," and the bluish or black species with tawny legs hailed as "sailors." They may be considered as ornaments to the garden, rather more abundant usually in the kitchen than in the flower garden, and not at all injurious, that I am aware of, unless they may cause alarm to some of those fanciful individuals who cannot bear to touch an insect. These Telephori, of which we have more than twenty British species, are carnivorous in habit, though they may occasionally nibble the petals of flowers. From their partiality to the various plants of the Umbelliferous order, it may be surmised that they seize the small flies and weevils which crowd on the flower-buds of such species. Boys pit a "soldier" against a "sailor," and the two will often engage in a sharp combat; but it is nearly as easy to induce two of the same species to fight as two distant relatives, the "law of brotherhood" not being observed by them, and what is still worse, beetles of opposite sexes will quarrel. And yet the delicate appearance of the beetles and their somewhat tardy movements (for though they can fly well they seem reluctant to employ their wings), would make us fancy them quite of a pacific sort. The larvæ if unsightly do not obtrude themselves on notice, and most if not all are carnivorous like the perfect insect. Some of them feed on earthworms, and on small grubs of various kinds that are found just beneath the surface of the ground. Should we unearth one, we perceive that it is of moderately stout build, the sides of the body made strong by ridges, and the head adapted for digging as well as killing. These feed at intervals during the winter, and are active in April and May, when they are full-grown. The pupa state is brief in duration.—J. R. S. C.

NOTES FROM NICE.

WHILST we are receiving accounts of the very cold and snowy weather prevailing in England, Scotland, and many parts of France, we are here enjoying the warmth of a southern sun, and only see some of the snow on the mountains at a distance. The Maritime Alps are now well covered, and present a very fine appearance. There has been a little frost at night, soon dispersed by the rays of the sun. The flowers in the market and at the various magazines are still in considerable abundance. The Tea and other Roses very beautiful, with *Heliotropes*, *Jasmine*, *Tuberose*, *Violets*, *Abutilons*, and various sorts of *Hyacinths* and *Narcissi* now coming into bloom, all growing out of doors. Large *Primulas* in pots are sold at fifty centimes each, and large handsome bouquets with Orange blossom and *Mignonette* for a franc. Some of the principal plants now in blossom in the public and other gardens (open air) are *Eriobotrya japonica* (Japan Medlar), *Acacia tomentosa*, *Siphocampylus bicolor*, *Calycanthus præcox*, *Abutilon venustum* and *striatum*, *Justicia Adhatoda*, *Spar-*

mannia africana, *Hibiscus africanus*, *Raphiolepis indica* (beautiful), *Freylinia cestroidea*, *Habrothamnus elegans*; *Salvia involucrata*, *eriocalyx*, *splendens*, and many others too numerous to mention.

There is now in blossom at the Villa Zuylen, at the back of the Villa Bermond, in the Quarter St. Etienne, a splendidly large specimen of the (in England) rare plant *Bougainvillea spectabilis*, covering the front of the peasants' house with its beautiful pink bracts, or what would be more popularly called flowers. The real flower is contained within the terminal coloured bracts or leaves. This plant is well worthy of a visit; and there is also in front of the villa one of the most magnificent Date-bearing Palms in the neighbourhood, with several other rare plants in flower also (Dec. 22nd).—EDWARD COPLAND.

BAROMETER AND THERMOMETER TABLE AT NICE FOR THE WEEK ENDING 16TH DECEMBER, 1874.

Date.	Days.	Barometer at Noon.	Thermometer hung facing the North.				Sky at Noon.	
			9 A.M.	Noon.	6 P.M.	Maxi- mum.		Mini- mum.
Dec. 10	Thursday ..	29.4	49	56	48	58	44	Cloudy.
Dec. 11	Friday	29.6	46	51	45	52	49	Cloudy.
Dec. 12	Saturday ..	29.3	49	54	49	58	41	Fair.
Dec. 14	Monday	29.4	42	45	42	49	40	Cloudy.
Dec. 15	Tuesday	29.5	42	49	44	51	40	Cloudy.
Dec. 16	Wednesday ..	29.5	41	49	41	59	39	Fair.

MONT D'OR BUTTER BEAN.

IN reply to Mr. Bester's strictures, I may observe that tastes differ, and so do cooks. I maintain that the Bean is an excellent one, greatly superior to other kinds in the quality, but not in the quantity of its produce. For this important reason I strongly recommend it. The only objection that can fairly be advanced against it is on the score of colour, which is certainly "yellowish green;" but whether this is a blemish or not is a mere matter of opinion, and does not at all affect its real value. Will Mr. Bester allow me to suggest another trial and a pair of green spectacles? then, if he is sure of his cook, I venture to hope that he will allow at least some merit in that which he now so sweepingly condemns.—EDWARD LUCKHURST.

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

RHEUM OFFICINALE. Nat. ord., Polygonaceæ. Linn., Enneandria Trigynia.—"According to the evidence hitherto obtained, this grand plant (which is certainly the handsomest of all the Rheums, except the Himalayan *R. nobile*), is that which produces much if not all the Turkey Rhubarb of the pharmacopæia. It is a native of and also cultivated in eastern and south-eastern Tibet, and was sent thence by the French missionaries to M. Dabry, the French Consul at Hankow. M. Dabry sent plants to M. Soubeiran, Secretary of the Jardin d'Acclimatation of Paris, where they flowered at Montmorency in 1871.

"An excellent history of this plant is given in Flückiger and Hanbury's 'Pharmacographia,' quoted above, from which it appears not to be certain that the true Turkey Rhubarb of commerce is derived exclusively from this plant, though the evidence of the missionaries who discovered it, that it is the main source of that drug, is supported by the fact that there is no important discrepancy between this *R. officinale* and the imperfect and scanty accounts and figures of the Chinese authors and early French missionaries. From the same work we learn that the drug was known to the Chinese long anterior to the Christian era, and was described in a work dedicated to the Emperor Shen-nung, the father of Chinese agriculture and medicine, who lived about 2700 B.C. Also that Marco Polo is the only traveller who has visited the districts yielding Rhubarb, in the mountains of one of which (Tangut) he describes it as growing in great abundance; this, however, is an error, for an account of it will be found in the travels of Bell of Antermomy (vol. i. p. 384-387), who found it in Mongolia, growing abundantly near marmot burrows. One of its most remarkable characteristics is its stout very distinct stem, which, and not the root, is considered to be the source of the Rhubarb in the view of M. Baillon, and no doubt correctly."—(*Bot. Mag.*, t. 6135.)

EPISCIA FULGIDA. Nat. ord., Gesneriaceæ. Linn., Didy-

namia *Gymnospermia*.—It is a native of New Grenada. Flowers scarlet. Leaves variegated.—(*Ibid.*, t. 6136.)

BOCCEROSTA MAROCCANA. *Nat. ord.*, *Asclepiadaceæ*. *Linn.*, *Peotandria Digynia*.—Native of Morocco. Flowers purple.—(*Ibid.* t. 6137.)

ONCIDIUM ZEBRINUM. *Nat. ord.*, *Orchidaceæ*. *Linn.*, *Gynandria Monandria*.—"A very attractive plant from the pure white of the perianth, with its red purple bars, and the fine gamboge yellow of the bars of the lip; at least such are the attractions of the variety figured here. But Reichenbach describes a form in which the whole disk of the sepals is violet, and with only one violet spot at the base of each petal. In the length of the panicle it exceeds all other species I have seen growing; in the specimen here figured it was 12 feet long.

"*Oncidium zebrium* has been sent home, living or dried, by various collectors, and was first flowered, according to Professor Reichenbach, by Mr. Bull in 1872."—(*Ibid.* t. 6138.)

FUCHSIA PROCUMBENS. *Nat. ord.*, *Onagraceæ*. *Linn.*, *Oetan-dria Monogynia*.—Flowers yellow and purple. "This curious little plant, so unlike a *Fuchsia*, in habit and colour of the flower, was discovered in 1834 by Richard Cunningham in the northern island of New Zealand, on the shores of the east coast, opposite the Cavalhos Islands, growing on the sandy beach, where it has since been gathered by Colenso. It has also been found on the Great Barrier Islands by Mr. Kirk, in two localities, both near the sea."—(*Ibid.*, t. 6139.)

PLUM.—*Prince Englebert*.—"It is now extensively grown around London for market purposes, and is one of the best sorts where annual and remunerative crops are a consideration. Its bearing qualities are something remarkable, and its quality by no means to be despised, even for dessert, while in the culinary department it has very few superiors. Dr. Hogg describes it as having 'Fruit very large, oval, and marked with a shallow suture. Skin of a uniform deep purple, covered with minute russet dots, the whole thickly covered with a pale grey bloom. Stalk half an inch long, inserted in a rather deep cavity. Flesh yellow, rather firm, sweet, juicy, with a brisk and rich flavour, and adhering to the stone. Shoots smooth.' To this he adds the remark, which we can fully endorse, that it is 'an excellent Plum, either for the dessert or for culinary purposes, and delicious when preserved. Ripe in September. The tree is a great bearer, and in this respect is one of the most valuable for large culture.'—(*Florist and Pomologist*, 3 s., vii., 277.)

SOME OF THE VEGETABLE PRODUCTS OF CEYLON.—No. 5.

MANILLA HEMP, and *China Grass* or *Nettle* (the latter being employed in the manufacture of clothing material), are being cultivated in the Royal Botanical Gardens, and plants are being applied for by persons desirous of extending their cultivation in Ceylon.

SILK.—The present Governor has addressed the Secretary of State in reference to the production of silk in Ceylon. His Excellency is of opinion that with due care and attention silk might be produced in Ceylon in any quantity. The Mulberry tree grows luxuriantly in the island, and the worms are both hardy and appear to thrive well. Careful manipulation by patient and experienced persons is at present wanting, and until such be forthcoming the silk grown in the island must be sent in the dried cocoons to Europe to be spun, and this latter procedure is followed from various parts of the East. Japanese or Chinese settlers in Ceylon would overcome all such difficulty, and the production of silk may ere long be added to the exports from Ceylon.

GINGER, *PEPPER*, *CLOVES*, *ARROWROOT*, and *TAPIOCA* are cultivated, but only Arrowroot and Pepper are exported, and that in but trifling quantities. The great rise in the price of Cloves, and the immunity from hurricanes which Ceylon possesses, render the question of their extended cultivation in the island well worthy the consideration of its inhabitants. The hurricane that swept over Zanzibar in 1872 is reported to have laid waste and swept away entire crops of Cloves. There is a movement, Dr. Thwaites mentions, among European planters as well as Cingalese, to take up seriously the cultivation of Cardamoms, and he is preparing by adding to the Botanical Gardens own plantings to meet the increased demand.

COCOA.—It is stated in a late number of the *Agricultural Economist* that the culture of Cocoa is likely to have a future for commercial purposes in Ceylon. It seems that, like To-

bacco manufacture, the great art has laid more in the curing than the growing, and that this involves a sweating and fermenting operation termed "terrage." That brings out the full flavour of the nut. The samples that have been lately received in England from the Ceylon Botanic Gardens are considered good, only more attention will have to be paid to its preparation after being removed from the tree.

EDIBLE FUNGI.—These are found in Ceylon, and a volume of drawings of the same were laid before the Woolhope Club at the great Fungus festival held at Hereford in October last.

THE PLANTAIN.—There are seventeen kinds of this excellent fruit found in Ceylon. The Soewendel, the Hokekoolto, the Kadely, and some others are sweet and luscious. The Alookehel is given to invalids to provoke appetite. The Kamerooroo makes a good curry. The Etikehel is not cultivated, but grows wild in the hilly jungles. It is said to possess medicinal virtues, and is prescribed by native doctors.

It would, I think, be well if some enterprising person in Ceylon would send to England in some quantity, a consignment of dried Plantains, and when it is considered that some 30,000 cwt. of dried Figs are annually imported into England, the speculation would, I am inclined to think, be a successful one in a pecuniary point of view. The taste for the dried Plantain, if properly prepared, would be soon acquired in England, and doubtless lead to a brisk demand. The following is the mode of drying the Plantain followed in Mexico, as stated by Capt. Colquhoun of the Royal Artillery:—

The fruit is gathered when fully ripe, and is laid on light cane frames exposed to the sun. When it begins to shrivel the outer skin is stripped off, and then the drying is completed. During this process it becomes covered with a white mealy efflorescence of the sugar, as the Fig does under similar circumstances. For convenience of transport it is pressed into masses of about 75 lbs. each, and is wrapped in plantation leaves. It is evident that the fruit in this state bears precisely the same relation to the fresh Plantain that the raisin and dried Fig do to the fruits from which they are prepared, and may be expected to keep good as long as either of them. Indeed, samples have been sent to England from Mexico which had been prepared for two years, and they continued to be sufficiently moist and of a consistence and flavour between the Date and the Fig, without acidity, and indeed sweet.

As the "Food Journal," I am aware, finds its way to Ceylon, the above information may be of use, and it is to be hoped we may yet see importation on a large scale of the dried Plantains into England. If Chinese obtain a footing in the land of Cinnamon and pearls this will doubtless be the case.

ORANGES, *PINES*, and *OTHER TROPICAL FRUITS* are most prolific. The Vine yields largely in portions of the northern and north-western provinces. It formerly was cultivated at Kandy, in the central province, but at present it ripens there but rarely, and there is a theory that this is occasioned by the change of climate consequent upon the cutting-down of the large trees in and about Kandy, trees which both sheltered the Vine and occasioned a sort of artificial winter.

The Dutch Admiral Spelberg, who was in Ceylon in 1602, mentions (in his narrative of his voyage to India), and highly praises the wine made from Grapes grown at Kandy. Much discussion has taken place on the alleged injurious effects on climate and soil by the destruction of forest trees. An able planter of long residence in Ceylon, in the course of a valuable paper he placed at my disposal when I was holding the post of government agent in the central province, laid it down as his opinion, that although the forests of Ceylon, India, and Abyssinia were rooted from the ground, the great circulation of moisture would go on the same, and the land thus bared would soon reclothe itself, the vegetation being the resulting effect of the rain and not its cause."

Humboldt was, however, of opinion, that by the great evaporation from leaves an amount of moisture is diffused through the atmosphere, which, wafted by winds, waters wide districts of country. Moreover, woods shelter the ground beneath, and materially retard the evaporation of the water that falls as rain. Consequently, springs are kept flowing, rivers do not dry-up, and the lowland cultivators can always depend on the distant hills for the means of irrigating their crops. I officially drew the attention of the Ceylon Government some years ago to the desirableness of reserving belts of forest land growing round the source of streams, and adverted to the precautions that were taken by the Mauritius Govern-

ment on the subject.* What differences of opinion may exist as to the effect produced on climate and the supply of water by the destruction of timber, all must agree as to the impolicy of permitting the indiscriminate destruction of valuable forests. There are, of course, instances where the progress of civilisation renders the destruction of forests necessary; but there are also cases where such should be preserved, and which, if ably supervised, would afford unfailing supplies of valuable timber. I may add, that there are some ninety-six species of timber trees found in Ceylon.—E. RAWDON POWER, F.R.G.S., *Ceylon Civil Service (Retired), Tenby, South Wales.*

NOTES ON VILLA AND SUBURBAN GARDENING.

WITH a sharp frost every night, and the ground still covered with snow, induces one's attention to be turned to things under cover, and one of the first things that suggests itself to those with time on their hands is the fruits and vegetables in store. Amateurs are many times not so well supplied with storeroom as the professional man, and therefore the produce is often by compulsion thrown into a heap, and through that the necessity of frequently looking over them is the more apparent, because they are much more liable to decay from heating or sweating; and Potatoes, for instance, when laid in a heap often, to look at the outside, appear to be keeping well from disease as well as sprouting, but pull the heap to pieces, and it may be that some of them are rotting and others making shoots, to the great injury of the tubers, whether for eating or for seed; hence my reason for saying that this is a very proper time to go through everything of the vegetable kind, as well as that of the fruit; and even if no decay or sprouting is found, the fact that they are moved out of one position into another, so long as that be done properly and carefully, is much to the good of all, and if they could by any means be spread out upon the floor for a few hours the benefit they receive will be greater still.

Salading of Sorts.—There is such a demand for salads at all times of the year, even in the smallest of families, that the work of raising them may be safely alluded to here, especially now that Lettuces and one or two other of the principal things required to make up a salad are short or wanting altogether. In my case it is necessary that a small salad should be supplied every day, and just now, besides Celery, it is made up of late Endive which was stored away in cold frames, and though kept as dry as possible, it has just been examined on account of some of it rotting, and some Corn Salad, which was planted thickly in boxes and put into a very mild heat, and Mustard and Cress, and last, but not least, some forced Chicory. When Endive is over more of the other things will be required, and consequently any addition in the way of Radishes; these are sown among the Early Horn Carrots in a frame, with a bed of mild-heating leaves under them. The sorts sown are the French Breakfast and Wood's Early Frame. The Carrots are sown in rows, and the Radishes also in rows, alternately one with the other. The Mustard and Cress is sown in shallow boxes, and with the seeds not covered, but pressed into the soil, watered, and placed over the boiler in the stovehole. After they have vegetated they are brought into the vinery at work, or in the absence of that the greenhouse will answer well. It may be mentioned that these things may be sown and reared in several different places where there is heat sufficient (and very little is needed) to cause the seeds to vegetate. I have been so far particular over what appears to many a very simple thing, but I may say that it is not at all times an easy matter for an amateur to get a supply of this part of a salad, and if he can be helped out of his difficulty by letting him know of an easy common method he will be the more likely to once more try to enjoy some from his own growing. Then as to Chicory. At this time of the year it is indispensable in a salad, and I believe very wholesome. The roots are grown from seed sown in May on rich ground, and in a similar manner to Carrots, and the rows the same distance apart; they are thinned out in due time, and kept growing as fast as possible during the season. The roots may be taken up in November, and the tops cut off and stored away the same as Carrots. When required for forcing, some of the roots are planted in a frame with a gentle heat where the light is kept from them. In a short time they commence to

grow at the crown, which produces tender and fleshy leaves perfectly blanched, of a yellow colour, and a most excellent addition it is to a salad. Now, Chicory is a very easy thing to force, and may be done in several ways. For instance, if the roots are planted in some sandy soil in a cellar, or planted in pots thickly and covered with another one to keep them dark, a good result may be expected. It is very easily started into growth, and does not require the attention that many things do to bring them to perfection, and which an amateur can generally ill afford to give it.—THOMAS RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

THE weather is still such that no work can be done in the kitchen garden different from that of last week. One thing we were enabled to do, and that was to write out the seed order. Some few sorts of vegetables we save seeds of ourselves, but we long ago discovered that it does not pay to make a general practice of this. We do not, therefore, feel inclined to take the trade out of the hands of the seedsmen. They have considerable advantages over gardeners, as they can have the different classes of seeds saved in the districts and soils best adapted to them. Indeed, some of our best vegetable and flower seeds require to be saved in France or other warmer countries of the south of Europe; and even if a gardener does prefer to save a certain favourite vegetable for seeding purposes, it is frequently desirable to change it to another district to prevent degeneration.

There are a few of the new vegetables being sent out this season which certainly deserve a trial, but it is best to stick to our old friends, which have proved constant to us whether the seasons be wet or dry, cold or hot. To begin with *Potatoes*, one or two of the new American sorts deserve a fair trial. They are distinct from any of the English-raised varieties, and are enormous croppers in some soils and favourable seasons. The flavour is fairly good, but at their very best not equal in this respect to the best of our own kidney and round varieties. Snowflake is one of the best white sorts, and Vermont or Brownell's Beauty the best of the reds. The varieties of Potatoes are very numerous now. Some persons grow over a hundred distinct sorts; but, of course, this is a mere whim or fancy, as for all useful purposes half a dozen are sufficient. We grow in the garden Myatt's Prolific Ashleaf and Veitch's Improved Early Ashleaf; and for a round sort, though that has been given up for the last year or two, the Early Coldstream. The best field sorts are Dalmahoy, an early Regent, Walker's Regent; and for late, the Red-skinned Flourball.

Amongst the new *Peas* Dr. Hogg will probably hold the first place; it is the earliest wrinkled Marrow, and a good cropper. William I, Alpha, Champion of England, G. F. Wilson, and Veitch's Perfection are the favourites. The Seville Long-pod *Bean* is a very distinct and desirable sort; it is not quite new, but is not grown to a large extent in England. We grow but one sort, and that is the Broad Windsor. *Dwarf Kidney Bean*, Newington Wonder, and Negro Long-pod *Scarlet Runners*. *Beet*, Dell's Crimson. *Broccoli*, Snow's Winter White, Walcheren, Knight's Protecting, and Perkins' Leamington; the last is a fine new variety. *Brussels Sprouts* (imported seed) and Scrymger's Giant. *Cabbage*, Early Dwarf, York, and Enfield Market. *Carrot*, French Forcing, James's Intermediate Scarlet, and Red Surrey. *Cauliflower*, Early London and Lenormand's. *Celery*, Williams's Matchless Red and Sandringham Dwarf White. *Cucumber*, Tender and True, Telegraph. *Endive*, Batavian (Fraser's Improved), Green Curled. *Lettuce*, Cabbage, Drumhead, Hicks' Hardy White Cos. *Melon*, Scarlet Gem and Gilbert's Victory of Bath. *Onion*, Brown Globe, James's Keeping, and White Spanish; also Two-bladed for pickling. *Parasnip*, Hollow-crowned Improved. *Radish*, Red Turnip and French Breakfast. *Savoy*, Drumhead and Dwarf Green-curved. *Spinach*, Round or Summer, Prickly or Winter. *Tomato*, Orangefield Dwarf. *Turnip*, Early White Stone and Veitch's Red Globe. *Vegetable Marrow*, Short-jointed Long White. The above selection of vegetable seeds have been proved to be the best for our district, and our soil is very unsuitable for vegetable culture.

Covered Rhubarb with some rough manure from the farmyard; this protects the crowns from frost and causes the leaves to start into earlier growth.

GREENHOUSE AND CONSERVATORY.

During severe frosts there is much danger to be apprehended from the hot-water pipes, and much more so in structures heated by the old-fashioned flues. During the winter season, when the heating apparatus is not in use, the plants may not require any water for a whole week. We look over our plants about twice a week, but not more than half of them will require water; but suddenly a severe frost sets in, the fires are lighted up, and should any plants be near the pipes they become dry and are sometimes neglected. During a frost it is necessary to look over the plants every day. Careful watering, especially in the winter season, is an indispensable agent to successful culture. Much of our time is still employed cleaning the wood and glasswork of the houses, and also the plants.

* I find some years ago that I also addressed a letter to the Government of Ceylon, of which the following is an extract: "The subject of timber in the central province, and indeed throughout the island, is becoming so very important, that I think the appointment of a separate officer as Inspector of Crown Forests, &c., is well worthy of His Excellency's consideration as both an economical and very desirable measure. With an active and efficient officer in such a post—and I may add that in every large district in British India such an officer is to be found—we might hope also to encourage the planting of valuable young trees in favourable localities, and thereby remedy in course of time the evil involved in the reckless destruction of valuable timber which has taken place for many years past in this colony." I have reason to believe that the Ceylon Government have taken action on this important subject.

One of the most useful flowering plants at the present time is the *Cineraria*. Green fly is very fond of feeding on the juices of the leaves, and thrips does not disdain to attack it. The best way to get rid of either is by fumigating the house. We started to grow a named collection of them, and for exhibition purposes it is quite necessary that the very best sorts should be cultivated. Those who grow to decorate the greenhouse and conservatory, or to furnish a few cut flowers, will go in for seedlings. For early flowering it is best to sow the seeds about the first week in May; and it may not be amiss to remark here, that as far as regards dates our friends in the north would do well to be two weeks at least earlier than us; the system of culture ought also to be slightly different. The sun is not so powerful away north. We have grown *Cinerarias* splendidly in frames facing south when in Scotland. In the neighbourhood of London this will not do; the back of the frame must be turned south. Even under this treatment a little shade is desirable. Loam and leaf mould in equal proportions is the best compost in which to sow the seeds, just covering them over with the finer portion of it. When the seedling plants are large enough to handle they ought to be pricked out singly in small pots, using the same compost; in a few weeks the plants will require to be repotted, using this time two-thirds turfy loam, one-third leaf mould, and a little rotted manure in addition, with silver sand if that is necessary. The most useful sizes of pots to flower them in are 5, 6, and 8-inch inside diameter, they are called with us 48's, 32's, and 24's. No sticks are necessary to support the flowers, but all through the growing season keep the plants as close to the glass as possible, allow them abundance of light and air, but shade from scorching sun. *Calceolarias* succeed them in flowering, and are also valuable. The same treatment is necessary, but the seedlings are more tender, and the seeds should be but slightly covered with fine sand; it is also quite necessary to support the flower stalks with neat sticks.

Picking the withered leaves from *Azaleas*, and training some of them that had not been done previously. The main collection of *Azaleas* is now at rest, and the house is kept as cool as possible. We do not observe any traces of thrips now, but a few were observed on the plants in the summer; it will therefore be best to give a thorough fumigating with tobacco smoke before any plants are taken into the conservatory from the forcing houses. The tender growths that have been nurtured in a high temperature will not stand as much smoke as will kill thrips. Before watering an *Azalea* plant, or indeed any New Holland specimens, they ought to be dry, and yet overdryness is as great an evil as too much water. An experienced cultivator can tell by striking the pot with his knuckles: at any rate, the pots must be watered before the soil is dust-dry, and give enough to thoroughly soak the ball of roots. If the water rushes through the holes in the bottom of the pot suddenly and in quantity, it is probably because the mould has shrunk from the sides through becoming too dry. If this is the case a rammer should be used to press the ball firmly into the pot again, and it may even be necessary to soak it in a tank or tub of water.

We do not force large quantities of flowers for the greenhouse, but have placed some pots of *Roses* in the early vineries, and have introduced a few *Hyacinths* and other Dutch roots into heat. Those who require quantities must now introduce *Spiraea japonica*, *Lily of the Valley*, *Hyacinths*, *Tulips*, *Polyanthus Narcissus*, *Dentzia gracilis*, and *Dielytra spectabilis*. The heat must not be more than 45° or 50° at first.

FORCING HOUSES.

The early vinery is starting strongly, and we have discontinued syringing. The only time we use the syringe on our Vines is when the house is first started, and this is done with a view to cause the buds to break evenly and strongly. When this has been accomplished the syringe does more harm than good, especially at midwinter; in April and May it would be different. Strawberry plants in pots that are starting have been removed from a house where they have 50° at night to one of from 55° to 60°, a fresh batch having been removed into the place of them. We do not allow any of the plants to suffer for want of water at the roots.—J. DOUGLAS.

TRADE CATALOGUES RECEIVED.

Carter's Seed Order for 1875.—High Holborn, London.
Vick's Floral Guide for 1875.—Rochester, New York, U.S.
Seed List.—Otto Putz, Great Russell Street, Bloomsbury.

TO CORRESPONDENTS.

* All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

BOOK ON BEDDING (A Constant Reader).—Our book on "Garden Plans and Borders" is now preparing for a new edition. It will treat fully on bedding.

TETRATHECA VERTICILLATA (I. L. H.).—This is the same as *Tremandra verticillata*.

PRIMULA SINENSIS GRUB-EATEN (Gardener W. H. P.).—The grub eating your *Primulas* just below the soil's surface is the larva of the Daddy-long-legs, *Tipula clarea*, and the grub is called the Leather-jacket. This plague occurs frequently.

TILLANDSIA LINDENI.—"If your correspondent, 'W. C.' will turn to 'Floral Magazine,' plate 44, new series, he will there see a figure of *Tillandsia Lindenii* with two flower spikes, both lateral. This plant was exhibited at the Royal Horticultural Society in 1872 by Messrs. Vetch & Sons, and obtained a first-class certificate.—W. G. S."

EARLY PRODUCE (C. W.).—If you put your questions so that they can be understood we will be pleased to answer them. First, what do you propose to grow in the long span-roofed house? You would get the best return from Grapes ripe in May and June in the earliest house, and late Grapes, Alicante and Lady Downe's in January, February, and March. In the early house you would require six rows of 4-inch pipe, and a lean-to or half-span would be better than the span-roof. Four rows of piping would be sufficient in the late house. Bottom heat is unnecessary. The market is not likely to be overstocked with good Grapes. Write again if we have misunderstood you.

LOBELIAS TO BLOOM THROUGH SUMMER (R. A. P.).—Plants from seed would be most enduring in your light soil, and to maintain them in good condition the ground should be liberally dressed with rotten manure, and copious waterings given in dry weather. There is no better kind than *Lobelia speciosa*, taking care to have seed of a good strain; and a white variety, a companion for it, is *White Perfection*. *L. pumila grandiflora* requires good rich soil, and is only suitable for carpet-bedding. The seed should be sown about the middle of March in a hotbed, and the plants when large enough to handle pricked-out about an inch apart, growing-on in gentle heat, and hardening well off before planting-out. It is not necessary to sow for a succession.

FERN INFESTED WITH INSECTS (J. H. S.).—We cannot find any small scale nor traces of any, but there are abundant evidences of thrips having been actively at work upon the frond, the remedy for which is to fumigate with tobacco, taking care not to apply it too powerfully, or there will be a danger of some kinds of Ferns being injured—as the tender growths of *Adiantums*.

PIPING REQUIRED TO HEAT A HOUSE (Rus.).—Your house will contain 2244 cubic feet of air, and to heat this to 60° in all weathers you will need (the mean temperature of the external air being taken at 32°), 232 feet of heated surface or that extent of 4-inch piping, the temperature of the pipes being 160° to 180°; but if you do not wish to have more piping than is absolutely required, you may employ 176 feet of 4-inch pipes. By the former you will have four rows of pipes all round the house, and by the other four rows along two sides and one end.

PLANTING ESPALIER APPLES AND WALL PEARS (H. W.).—The Apples should be 24 feet apart, as the espalier rails are only 4½ feet high. The Pear trees on the 9½-foot wall ought not to be nearer to each other than 24 feet.

RAIN GAUGE (G. S. X.).—Trye's "Companion to the Weather Glass," price 1s. Published by Bemoze, London and Derby.

NAMES OF PLANTS (W. Lomas).—The flowers are *Chrysanthemums*. We cannot name florist's varieties.

POULTRY, BEE, AND PIGEON CHRONICLE.

BANTAMS PAST AND PRESENT.—No. 1.

Why it is that we, as a rule, prefer the dwarf to the giant I know not. I only know that it is so. Some few years since there arrived in England about the same time the Chinese giant "Chang," and a gigantic Frenchman, name forgotten. The Chinese, because of his dress and because a dwarf accompanied him, did very well; the poor tall Frenchman being alone remained alone, none crowded to see him. Captain Batea, of huge stature, had the two-headed Nightingale beside him, and many more cared to see the poor dwarfish girls than the huge American. But to no giant, however accompanied, rushed such numbers as crushed and crowded-in to see the four little dwarfs, General and Mrs. Tom Thumb, Commodore Nutt, and Miss Minnie Warren. They made their fortunes, and pretty fast too. More than that, how they were "darlinged" and "deared" by ladies of all ages! Why all this I know not, but it is so.

This rule of preferring small to large holds good in regard to pets; indeed, petland is a kind of fairy land whose inhabitants must be small. Thus among dogs, the pug, not the mastiff, is the pet; the Maltese not the Newfoundland. Go among the Pigeons at a show, the ladies crowd around the Jacobins not the Runts. And when the ducks (the big-chignoned I mean), go among their namesakes, it is the little Black East Indians that they admire, not the big Rouens. And as to the poultry, who ever saw a lady look at a tall Malay save with a shudder? No, she soon walked away from that gawky giant and went to the—Bantams.

Now, if thirty-five years ago or so a child had said to another, "Come and see my Bantams," they would in all probability

have been Nankin Bantams, the common Bantams of that period, and not unfrequently called "Yellow Bantams." The old-fashioned speckled Booted Bantam were already old-fashioned and scarce, and belonged to a prior age. Then, too, if a lady or gentleman of taste in poultry, for there was always a taste for and in poultry, limited very much to Game among men, and Bantams among ladies—if, I repeat, such a one had said to a friend, "I have just got some very pretty Bantams sent me," they would in all probability have been Sebrights. White and Black there also were, more, I believe, of the former than of the latter.

Next let me contrast the Nankin Bantam of that day and this. The cock was an upright bird, standing-up as high as he could reach, not in the attitude of the Black Bantam cock of the present day. He reached-up a good way; and mark you, Bantams were not so small as a rule then as now. The Nankin Bantam cock of the past was, as to colour, red and black. But to take him in detail. Comb, in the best, very double, but there were single ones as well; eye fiery; wattle and face very red; hackle red and full; breast black, ditto legs and thighs; wing bow red, rest of the wing black and very lustrous; saddle red; tail black and shiny with sickles splendidly developed; the flight not tucked-up like the Game Bantams, but pointing downwards; legs blue or dark and without a single feather. Such was the Nankin Bantam cock of the past. Next, the hens that were found with this bird. They were nankin, or lankeen in colour. This was not the colour of the Cochins of the present day, it was not nearly so rich a colour. Nankeen was a sort of cloth imported from China, made of a yellowish cotton. That was nankeen, and that was its colour. Boys of the era wore and were delighted to wear in summer nankin trousers. A good many now middle-aged men and oldish men, have in their boyhood danced about in nankin breeches. The fashion has long since passed away, and as nankin trousers and petticoats have passed away, so has the material I believe; but worst of all, the true Nankin Bantam is gone too. However, this is forestalling the subject. The Nankin hens were exactly of that colour, not buff, not cinnamon, but nankin, a light pretty hue, sometimes mottled; the hackle of the hens streaked with black, and the tail also black at the end, the legs blue, the form neat. Such were the Nankin or Nankeen Bantams—very pretty, very interesting, an advance upon the Booted, which were the taste or fancy of the eighteenth century. I can see them distinctly in my mind's eye, for I kept many. I had my favourites, the rose-combed among the cocks, and the clearer-plumaged among the hens, and I aver that they were a distinct and true-breeding, aye, and useful little fowl.

Such were Nankin Bantams of the past. They laid a rich-coloured egg, not over-small, and they laid well and sat well. They and the Sebrights were the taste of the day, and many a farmers' wife or keeper of large fowls yet liked to have a few "Bantys" in the yard as well for pets, or very likely for the amusement of a child who was pleased to find and bring in the little eggs.

Now for the Nankin Bantams of the present day. As to the cock he seems to have departed altogether, for the bird now shown as a Nankin Bantam cock is in colour not unlike a Buff Cochin cock, and nothing like the bird of a former day. I believe the true bird went to make, or rather help to make, the Game Bantam cock; he and the true Game bred together produced dwarf Game fowl. But gone he is, like an old man, last survivor of a firm; he is taken into a new firm, and his identity and his individuality are no more seen or known. Fashionable once, he is fashionable no more. Pity 'tis, but true.

Next as to the Nankin Bantam hens of the present day, they are all wrong too, being, as far as I have seen them at shows, buff—Cochin-buff-coloured, and not the least like the hens of thirty years since.

At provincial shows I have seen a pair or so of these Bantams. At the Palace Show there was a class given, but the result so bad that the first prize was withheld. I believe the original Nankin hen went, like her mate, to help to manufacture the Game dwarfs. The nearest approach I have seen of late years to a proper Nankin hen was thrown from an inferior strain of Duckwing Game Bantams, one of their chickens being a very fair Nankin. Possibly in some outlandish part, some untravelled byway in Cornwall, or in Cumberland, or in East Anglia, they may exist; I hope they do, and I wish they could be shown, though I fear the Game Bantams have obliterated them. I would rather the two varieties existed, for there was room for them, and the cock and hen breeding diverse colours truly and regularly marked them out as a special and genuine variety.—WILTSHIRE RECTOR.

BRISTOL POULTRY AND PIGEON SHOW.—Mr. Cambridge's efforts to resuscitate the Bristol Show have been remarkably successful so far. The entries amount to 1117 pens of poultry and 632 of Pigeons, making a total of 2049 pens; and as, at this late season of the year, exhibitors have found which birds are good enough

to win and which are not, we may expect only the very cream of our poultry-yards to be there.

THE EXHIBITION DORKING.—No. 4.

BY T. C. BURNELL.

HAVING built a house and bought birds, the next question will be what to feed them on, and it will be as well here to go through all the different foods, giving the merits and demerits of each.

BARLEY is commonly thought to be the only food that fowls can possibly require, and many wretched birds are shut up in a small yard with nothing but a scanty allowance of this grain, and, to their owner's astonishment, do not pay. Fowls may be truly said to be omnivorous; they will eat and enjoy green food, grain, seeds, insects, worms, and a thousand things we wet not of. They also require access to a heap of lime rubbish, which is to them what salt is to us, besides helping to form the egg shells; and in addition to this they must have a supply of small stones to grind it all up with, gravel in the gizzard performing the same office for them that teeth do for us.

It will be at once seen, that however good barley is, it is insufficient by itself to keep birds in good health, and it almost amounts to cruelty to try to do so. For an occasional food it is well enough, but in my opinion is not equal to WHEAT.

The best wheat is at the present time selling at about 5s. 6d. a bushel, and at this low price is by far the cheapest and best food we can use. I do not approve of tail or offal wheat, as I am sure with all grain the refuse, though low-priced, is by far the dearest in the end. It is very well for a farmer to use such stuff, for it costs him nothing, but to buy such rubbish is a great mistake, more especially in barley, the lightest of which is all husk, and has no kernel. Good wheat, then, is my idea of a food, and one of which the fowls are particularly fond. They lay and do well upon it, and I think no one can err in giving their fowls one feed a day of it.

PEAS and BEANS are not generally used for fowls, but I can strongly recommend them. White peas are the best, and the beans should be cracked in a kibbling machine. They both form a capital occasional food for laying stock, and will bring the birds into splendid feather. They must not be given in excess, nor to chickens which are intended for the table, as they will make the flesh very hard and tough; but as old cocks and hens are generally pretty much this way already, no harm can be done then.

MAIZE, or Indian Corn as it is called in England, is a large yellow grain of which fowls are particularly fond. There are two sorts—large and small, the latter the most expensive. Maize is at the present time rather dear, and I do not recommend it except for an occasional change once a week, and then not to the white-feathered birds, or it will most certainly turn their plumage yellow. Some people may laugh at this idea, but such have only to see what cayenne pepper will do for Canaries to be at once convinced. Maize is fattening, but is not a good egg or flesh former, so is one of the worst foods for growing or laying stock; but it claims one merit—the sparrows cannot possibly swallow it, nor can it be trodden into the mud, and for this latter reason I generally have it used in wet and dirty weather.

OATS will be relished for a change, but they must be sound and heavy or the fowls will not eat them. White oats are preferred, and they should not weigh less than 39 lbs. to the bushel.

RICE I never use, and though apparently cheap, it will be found very dear in the end, as there is no "heart" in it.

BUCKWHEAT, a small dark grain very much like hempseed, is strongly recommended by some, but I could never get my birds to eat it: I have tried it several times, both for old birds and chickens, but it has always ended in waste. I daresay the fowls would eat it if seen, but none are so blind as those that won't see, and my birds seem determined not to see it even when laid on a white plate. A very little hempseed is not a bad thing in the early part of the year to start the hens laying, but if given in excess it is too forcing, and will cause them to lay eggs without shells. If given in the moulting season it is said to cause the new feathers to come of a darker colour, but as to this I cannot speak from experience, for I don't use above a quart of it in a whole year.

Grain ground up into MEAL and slaked with water—soft food as it is called—should be given to exhibition birds at least once a day, as, though a little troublesome to manage, it will be very advantageous to the fowls. In cold weather it should be mixed with warm water into a crumbly mass, and if given warm on a winter's morning will greatly promote laying. I always use a zinc bucket and an iron spoon to mix it, first pouring in a little water, and then the meal; if properly prepared it should not be sticky.

GROUND OATS is generally considered to be the best staple food, and my own birds have one feed a day of it all the year round. It must be borne in mind that ground oats are not the same as oatmeal, but the whole grain ground up, husk and all; it is very difficult to obtain good, and I send nearly fifty miles for it, but

am convinced that this extra expense is not money thrown away. When good it looks rather like coarse flour, and mixed with water should not show much husk.

BARLEYMEAL by itself is too sticky, and clams to the birds' bills, but if mixed with fine bran (sharps as it is called) it will answer very well; I sometimes mix it with ground oats, but fine bran will do equally well, and is much cheaper.

It will be seen from the above list that there is plenty of choice, and the oftener the diet is varied the better will the birds prosper; but it must be borne in mind that Dorkings fatten more readily than any other breed, and if we wish to keep them in good health they must not be overfed. In winter they may have almost as much as they will eat, but in summer they should be kept very short, especially if they have a grass run.

SOME GREEN FOOD is absolutely necessary; if not to be obtained in their yards they should have some given them daily—a mangel wrzzel is the best thing I know of, especially as the roots are very cheap, and will keep all through the winter. They should be chopped in half, the fowls will very soon eat the heart out of them.

My own Dorkings are fed twice a day—early in the morning, and the last thing before roosting time. In addition to this I usually go round the yards at mid-day with a pocketful of corn, and throw them a few grains while I see that they are all as they should be, and it will be well to bear in mind that "the eye of the master makes the horse fat."

One word as to purchasing food—if it is hoped ever to make fowls pay, the grain and meal must not be bought in small quantities, but should be purchased by the quarter or sack. Some friends of my own insist on purchasing it by the gallon, the result being that their birds often have none at all, and what they do have costs twice as much as my own.

Very little need be said on the score of drinking water, save that it should be changed every day, and is best kept in iron vessels, as the latter are not easily broken, and, if a little rusty, will give a chalybeate taste which will be very beneficial. For a number of fowls an iron pig-trough will answer very well, while what are sold as dog-dishes will do very well for a few.

BRAHMAS LATE LAYING.

I THINK it well to give you my experience with this breed since last autumn. I have both Dark and Light Brahma pullets hatched from the last week of February to April, which I considered might commence laying at end of September (seven months), as my pullets of previous year had done to the day almost. Up to time of writing this (December 21st) I have not had one egg, neither any from hens of this breed since 1st of October. They are all kept much as follows: In morning, shaked barleymeal; noon, whole barley or Indian corn; evening, barley-meal, varied with boiled vegetables and scraps of meat as opportunity offers; besides daily run for short time on grass and green food thrown to them. It appears to me most unusual for this length of time to elapse, more especially in pullets. I shall feel obliged if the result of your longer experience points to some reason, either the nature of this breed or present severity of season, as a cause.—*AGRICOLA.*

[We have no doubt that the severe weather retards the laying. See what Mr. Burnell says in our columns to-day on feeding.—*EDS.*]

MONEY RESULTS OF THE BIRMINGHAM POULTRY SHOW.

THE sales of poultry at the Birmingham Show amounted to £1450, against £1470 last year, and £1140 lls. in 1872. The prize birds were put up on the first day of the Show as heretofore; 51 pens entered in the aggregate at £249 lls., fetching under the hammer £348 19s., and leaving a surplus of £99 8s. to be divided between the exhibitors and the Society. Some of the birds fetched good prices. For instance, the silver-cup Light Brahma cock, entered for £5 5s., sold for £16 16s.; the silver-cup White Dorking pullets, entered at £6 6s., sold for £12 1s. 6d.; the third-prize White Cochins cockerel, entered at £20, sold for £31; the second-prize Rouen Ducks, entered at £8 8s., sold for £12 12s.; the first-prize young Turkey cock, entered at £6 6s., sold for £9 19s. 6d.; the first-prize young Turkey hen, entered at £10 10s., sold for £11 11s., and the silver-cup Jacobin Pigeons, entered at £12 12s., sold for £15 15s. A second-prize Light Brahma cock sold for £21; a fourth-prize pen of Buff Cochins hens for £10 10s.; and first-prize Black-breasted Game cock for £10 10s.; those being the amounts at which they were respectively entered. The following, with many others, were claimed at the catalogue prices:—The silver-cup Partridge-feathered Cochins hens, £50; the first-prize Brown-breasted Red Game cockerel, £25; a Black cock Carrier Pigeon, £20; a very highly commended Dark Brahma cock, £15 15s.; a third-prize Buff Cochins cockerel, £15; a pen of Dark Brahma

pullets, £12 12s.; a first-prize pen of Turbit Pigeons, £12; the silver-cup old Turkey hens, £11 11s.; a commended Dark Brahma cockerel, £10; a pen of Dark Brahma hens, £10 10s.; a pen of Dark Brahma pullets, £10 10s.; a second-prize Light Brahma cockerel, £10 10s.; the silver-cup Dorking-hens, £10 10s.; a commended Duckwing Game cockerel, £10 10s.; a highly commended old Turkey cock, £10 10s.; a first-prize White cock Pouter Pigeon, £10 10s.; and a highly commended pen of Fantail Pigeons, £10.—(*Irish Farmers' Gazette.*)

MANCHESTER POULTRY AND PIGEON SHOW.

THIS, the fourteenth annual Exhibition, was held, as heretofore, in the Zoological Gardens, Belle Vue. It continued during the 22nd, 23rd, and 24th inst. The entries amounted to 2600.

Dorkings, Cochins, Spanish, and Brahmas were judged by Mr. R. Teebay; Game and Black Red Game Bantams by Mr. J. H. Smith; Polands, Hamburgs, French Fowls, and Extra stock by Mr. J. Dixon; Ducks, Geese, and Ornamental Waterfowl by Mr. J. Douglas. Pigeons, classes 87 to 103, by Dr. Cottle; classes 104 to 127 by Mr. T. J. Charlton.

We need not particularise the prize birds, for in all the classes they were excellently judged, as might be anticipated when the names of those who made the awards are read. All the classes, both in poultry and Pigeons, contained most excellent specimens, and it is scarcely justifiable to observe that above all the Game were superior. We hope to give some comments next week; our two reporters were unavoidably absent. The attention to the fowls and Pigeons left nothing to be desired.

The following is a list of the awards:—

DORKINGS.—*Coloured, except Silver-Gray, Cockerel*.—1, C. Widdis, Grange, Howden-in-Wear. 2, E. Barker, Stokesley. *Pullet*.—1, J. Waite, Netherthorpe, Wakefield. 2, S. Brierley, Radnor, Rochdale.
DORKINGS.—*Cock*.—1, J. Walker, Rochdale. 2, W. Whitworth, jun., Longsight. *Hen*.—1, T. W. L. Hind, Kendal. 2, Mrs. F. S. Arkwright, Sutton Scaradale, Chesterfield.
DORKINGS.—*Silver-Gray, Cockerel*.—1, J. Moser, Aikrigg, Kendal. 2, W. W. Rutledge, Shortland, Kendal. *Hen or Pullet*.—1, W. W. Rutledge. 2, J. Moser.
DORKINGS.—*Rose-combed*.—1, J. Robinson, Snarlerland. 2, Mrs. A. Tindal, Aylesbury.
SPANISH.—*Cock*.—1, H. Beldon, Gostcock, Bingley. 2, J. Barry, Bristol. *Hen*.—1, J. Leeming, Preston. 2, J. Thresh, Bradford.
SPANISH.—*Cockerel*.—1, G. K. Chelcott, Bristol. 2, J. Leeming. *Pullet*.—1, J. Ghidon, Bristol. 2, Mrs. Allsupp, Worcester.
COCHIN-CHINA.—*Cinnamon and Buff, Cockerel*.—1, J. Walker. 2, W. A. Burnell, Kingley. *Hen*.—1 and 2, W. A. Taylor, Manchester. *Pullet*.—1, Walker and Cartmel, Kendal. 2, W. A. Taylor.
COCHIN-CHINA.—*Brown and Partridge-feathered, Cockerel*.—1, J. A. Taylor. 2, R. Lacy, Hebbeln Bridge. *Hen*.—1, T. Stretch. 2, J. H. Jones. *Pullet*.—1, Mrs. A. Tindal. 2, R. P. Percival, Northenden.
COCHIN-CHINA.—*White, Cockerel*.—1, R. P. Percival. 2, R. S. S. Woodgate. *Hen or Pullet*.—1, W. A. Burnell. 2, R. S. S. Woodgate.
BRAHMA FOOTRA.—*Dark, Cockerel*.—1, H. Lacy. 2, T. F. Ansfield, Cowley Mount, St. Helens. *Hen*.—1, T. F. Ansfield. 2, W. H. Crabtree, Levensham.
BRAHMA FOOTRA.—*Cockerel*.—1, R. P. Percival. 2, Horace Lingwood, Barking. *Pullet*.—1 and 2, M. Leno, Dunstable.
BRAHMA FOOTRA.—*Light, Cockerel*.—1, Mrs. A. Tindal. 2, R. P. Percival. *Hen*.—1, W. H. Crabtree. 2, J. Steel, Leek.
BRAHMA FOOTRA.—*Light, Cockerel*.—1 and 2, Horace Lingwood. *Pullet*.—1, P. Haines. 2, R. E. Horsfall, Liverpool.
POLISH.—*Cock*.—1 and 2, H. Beldon. *Hen or Pullet*.—1, G. C. Adkins, Birmingham. 2, A. & W. H. Silvester, Sheffield.
MALAYS.—1, R. Hawkins, Seaham. 2, S. B. Perry, Lymington.
CARVE-GEES.—*Cock*.—1, R. B. Wood, Uxeter. 2, W. Dring, Faversham. *Hen or Pullet*.—1, W. H. Crabtree. 2, R. B. Wood.
HOUDANS.—*Cock*.—1, E. B. Wood. 2, W. O. Quibell, Newark. *Hen*.—1, G. W. Hubert, Goolley. 2, W. Dring.
HOUDANS.—*Cockerel*.—1 and 2, R. B. Wood. *Pullet*.—1, W. Dring. 2, R. B. Wood.
GAME.—*Black-breasted Red, Cockerel*.—1, W. J. Pope, 2, C. F. Barnett, Nanterton. *Hen*.—1, W. J. Pope, Biggleswade. 2, W. Johnson, West Derby.
GAME.—*Black-breasted Red, Cockerel*.—1, S. Matthew, Stowmarket. 2, D. Harley, Edinburg. *Pullet*.—1, S. Matthew. 2, W. J. Pope.
GAME.—*Brown and other Reds, except Black-breasted, Cockerel*.—1, C. W. Bradley, Middleton. 2, G. F. Ward. *Hen*.—1, J. F. Walton, Rawtenstall. 2, D. Harley.
GAME.—*Brown and other Reds, except Black-breasted, Cockerel*.—1, H. E. Martin, Sealhorpe, Fakenham. 2, R. Ashley, Nantwich. *Pullet*.—1, J. Carlisle, Earby. 2, C. W. Brierley.
GAME.—*Duckwings and other Greys and Blues, Cockerel*.—1, W. J. Pope, Barmley. 2, J. Halsall, Widnes. *Hen or Pullet*.—1, D. W. J. Thomas, Brecon. 2, J. Fletcher, Stoneydough.
ANY OTHER VARIETY.—*Cock*.—1, C. W. Brierley. 2, J. F. Walton. *Hen or Pullet*.—1, C. W. Brierley. 2, J. Stabler, Great Duffield.
DUCKS.—*Rouen—Drake*.—1 and 2, T. Wakelield, Golborne, Newton-le-Willows. *Duck*.—1, T. Wakelield. 2, J. Walker. *White Aylesbury*.—1 and 2, J. Walker. *Black East Indian*.—1 and 2, J. W. Kellaway, Isle of Wight.
ORNAMENTAL WATERFOWL.—*Pair*.—1, J. J. Walker. 2, M. Leno.
GEES.—*White, Gander*.—1, J. K. Fowler, Aylesbury. 2, Capt. L. Anyon, Chorley. *Goose*.—1, J. J. Walker. *Young Goose*.—1, J. Walker. 2, J. K. Fowler. *Young Gander*.—1, J. Walker. 2, J. White. *Young Goose*.—1, J. White. 2, J. K. Fowler. *Young Gander*.—1, J. Lycey, Staffort. 2, S. H. Stott, Huntley Brook, Bury.
TURKEYS.—*Cock*.—1, Rev. N. J. Rileys, Newbury. 2, W. Wykes, Huncley. *Young Cock*.—1, E. Arnold. 2, W. Wykes. *Hen*.—1, E. Kendrick, Lichenfield. *Young Hen*.—1 and 2, J. Walker.
EXTRA STOCK.—*Any other variety*.—1, T. Aspin, Blackheath. 2, J. Walker.
HAMBURGERS.—*Golden-spangled, Cockerel*.—1, J. Patrick, Blackheath. 2, J. Long, Bromley Common. *Hen or Pullet*.—1, J. M. Kilvert, Wem, Salop. 2, R. Gladstone, Brook Green.
HAMBURGERS.—*Silver-spangled, Cockerel*.—1, T. Boulton, Handford, Stoke. 2, G. J. Duckworth, Church. *Hen or Pullet*.—1, J. Buckley, Ashton. 2, W. A. Hyde.
HAMBURGERS.—*Silver-pencilled, Cockerel*.—1, Duke of Sutherland. 2, Ashton and Booth, Broadbent. *Hen or Pullet*.—1, Ashton and Booth. 2, J. Robinson.
HAMBURGERS.—*Golden-pencilled, Cockerel*.—1, J. Walker. 2, G. J. Duckworth. *Hen or Pullet*.—1, J. Robinson. 2, H. Beldon.
HAMBURGERS.—*Silver-pencilled, Cockerel*.—1, Duke of Sutherland. 1.
GAME BANTAMS.—*Black-breasted Red, Cockerel*.—1, G. Hall, Kenil. 2, J. Blauders, Great Horton. *Hen or Pullet*.—1, W. Baskerville, Manchester. 2, T. P. Mansell, Lincoln.

GAME BANTAMS.—*Brown-breasted Reds*.—Cock.—1 J. R. Fletcher, Stone clough. 2, T. Barker, Burnley. Hen or Pullet.—1, J. K. Fletcher. 2, J. Anderson, Bialfoot.

GAME BANTAMS.—*Duckwings*.—Cock.—1, W. Baskerville. 2, F. C. Newbitt, Epworth, Rotham. Hen or Pullet.—1, J. Smith. 2, J. K. Fletcher.

GAME BANTAMS.—*Any other variety*.—Cock.—1, Mrs. E. Newbitt. 2, G. F. Ward, Wrebury, Cheshire. Hen or Pullet.—1, R. Brownlie.

BANTAMS.—*White, Clean-legged*.—1, H. Beldon. *Black, Clean-legged*.—1, J. Eamshaw.

ANY VARIETY.—1, M. Leno. 2, J. Walker.

PIGEONS.

POUTERS.—*Blue or Red*.—Cock.—1, H. Pratt, Bradford. Hen.—1, F. Gresham, Sheffield. *Any colour except Blue or Red*.—Cock.—1, H. Pratt. Hen.—1, Mrs. Ladd. *Black*.—Cock.—1, E. Yardley. Hen.—1, H. Yardley. *Pun*.—Cock.—1, E. Horner. Hen.—1, E. Fulton. *Any colour except Black or Dun*.—Cock.—1, E. C. Stretch. Hen.—1, E. Horner. *Young*.—Cock or Hen.—1, R. Fulton.

DRAGONS.—*Yellow*.—Cock or Hen.—1, W. Hill. *Blue*.—Cock or Hen.—1, F. Graham. *Silver*.—Cock or Hen.—1, F. Graham. *Any other colour*.—Cock or Hen.—1, A. Beswick.

ANTWERPS.—*Short faced*.—Cock or Hen.—1, E. Horner. *Long-faced*.—Cock or Hen.—1, J. W. Hill. *Red or Yellow*.—Cock or Hen.—1, J. Thompson. *Any other colour*.—Cock or Hen.—1, R. Fulton.

BARBS.—Cock or Hen.—1, W. Harvey. *Young*.—1, Major Cryer.

FANTAILS.—*White*.—Cock or Hen.—1, J. F. Loversidge. *Any colour except White*.—Cock or Hen.—1, H. C. Bowman.

TUMBLERS.—*Almond*.—Cock or Hen.—1, H. Yardley. *Beards or Balds*.—Cock or Hen.—1, W. Woodhouse. *Any variety not before named*.—Cock or Hen.—1, A. & W. H. Silvester. *Flying Long-faced Beards*.—Cock or Hen.—1, W. Hill. *Long-faced Balds*.—Cock or Hen.—1, J. Watts. *Long-faced Mottles*.—Cock or Hen.—1, J. G. Orr.

NUNS.—Cock or Hen.—1, W. Croft.

MAGPIES.—Cock or Hen.—1, M. Ord.

TURBITS.—*Red or Yellow*.—Cock or Hen.—1, W. Croft. *Any colour except Red or Yellow*.—Cock or Hen.—1, W. Croft.

SWALLOW.—Cock or Hen.—1, E. Horner.

ARCHANGELS.—Cock or Hen.—1, R. Wilkinson.

OWLS.—*English, Blue*.—Cock or Hen.—1, T. W. Townsend. *Any colour except Blue*.—Cock or Hen.—1, T. W. Townsend. *Foreign*.—Cock or Hen.—1, T. W. T. Wren.

KUNTS.—Cock or Hen.—1, T. D. Green.

TRUMPETERS.—Cock or Hen.—1, J. Holden.

ANY OTHER VARIETY.—1, M. Ord.

HECKMONDWIKE POULTRY SHOW.

THE Wool Warehouse, very kindly lent by Mr. J. Batley, jun.,

of Heckmondwike, is an excellent place for a show of the extent of the one above named, the light being good and equal, and at the one held on Saturday last the birds were well placed in pens of the Committee's own construction. The Society is an old one, and mainly constituted of very old fanciers who were in the fore part of the very commencement of the movement; but the schedule of prizes offered does not keep pace with the times, otherwise, and supposing a really good one were offered, there is little doubt but that they would receive a very marked amount of public support and confidence.

This may be almost called the Game Show of West Yorkshire, for here, year after year, the most skilled breeders of this part have tried their steel; but in this case we noted a marked falling-off in both numbers and quality of Game birds, and there were none we would notice particularly, except the first-prize Duckwings, which were adult birds of grand quality, and the three pens of noticed Piles, the first of which were Willow-legged chickens well shown; second, adult Willow-legged birds of grand colour, but out of condition; the highly-commended pen containing a raw recruit in the shape of a yellow-legged chicken, which must make its mark in the fancy with a few more months of age upon him. *Cochins* were a most excellent class, Buffs first, and Whites second, and every pen noticed. *Brahmas* good, with old first and young second, both Dark. *Hamburgs* were, however, poor, but the *Spanish* good, adult birds winning. In single cocks of any variety the first was a grand old Brahma, and second Brown Red Game; and in hens a magnificent Silver Poland was first and Spanish second. In *Bantams*, Game, the class was unusually good, and the winners very neat, stylish, and perfect; the first cockerel a little short in bar; but the second, though grand in colour, heavy in hackle.

In the next class Piles won, and they were quite up to the mark. Black Bantams were very good in head, but wanting in style, and longer in leg than is desirable, and other varieties a failure.

Of Pigeons there was a fair lot, but the pens were far too small. In *Carriers*, except the first, there was nothing of interest. *Antwerps* very good, as also the *Owls*, where foreign Whites were first and Silver English second. *Dragons* a fair lot also; the first Silvers gems, but the second, though the prize was awarded, had the appearance of cocks. In *Fantails* the winners were very good; and in *Barbs* we noticed a pen of Blacks in first position, which must be of great use to their owner. There was a class for common or Dovehouse Pigeons, which, by the way, ought never, in this day of high culture, to be left out, as they tend so much to set off the great difference of the varieties of Pigeons. In the Variety class the first were Pigmy Pouters, second Black Swallows, and third Spangled Ice, this being a very good class.

The CANARIES were in a very good position, and looked well, the great feature being the Yorkshire varieties of plain and marked birds, which are truly grand birds for the show-cage; as also the Manchester Rabbits were very good entries. We did not get the lengths of the Lops, but they seemed to be pretty well placed. In the next three classes Bradford carried

five of the six prizes off with some very capital Rabbits, Angora winning the prizes in the Variety class.

GAME.—*Black-breasted*.—1 and hc, H. Walker, Gomersal. 2, W. Jagger, Hornby Bridge. *Red*.—1, J. Jagger, Spinkwell, Dewsbury. *Brown Red*.—1, A. Sugden, Swinley, Cleckheaton. 2, S. & W. Sheard, Hightown. *hc*, F. H. Wright, Halifax. *Duckwing, Grey and Blue*.—1, H. C. Mason, Birstall. 2, Stringer & Hemingway, Leedsfield. *Any other variety*.—1, R. Walker, Gomersal. 2, W. J. Mason, Drighlington. *hc*, H. C. Mason.

COCHIN CHICKENS.—1, W. Mitchell, Birkenshaw. 2, C. Carr, Wilsden, Bingley. *hc*, J. Smith, Gilstad. *hc*, E. Pickles, Batley; H. Digby, Acra, Huddersfield; C. Day, Mirfield; Mrs. Kay, Gillingham.

BRAHMA POULTRY.—1, W. Schofield, Sunny Bank, Birkenshaw. 2, J. W. Stansfield, Halifax. *hc*, T. Walker, Bingley; Mitchell & Feather, Keighley. *hc*, C. Carr; A. Johnson, Heckmondwike; J. W. Stansfield; W. Schofield. *hc*, W. Firth, Birkenshaw.

HAMBURGS.—*Gold and Silver-spangled*.—1, A. Wilman, Dewsbury Moor. 2, Stringer & Hemingway. *hc*, E. Clayton, Keighley; W. Kellet, Birstall. *Gold and Silver-pencilled*.—1, C. Carr. 2, J. Smith. *hc*, H. Digby.

SPANISH.—*Black*.—1, J. Thresh, Bradford. 2, C. Carr. *hc*, E. Jagger.

SELLING CLASS.—1, R. Walker. 2, W. Kellet. *hc*, H. Digby (2); J. Smith; S. Greenwood, Wilsden Hill, Bingley; C. Carr.

ANY BREED.—Cock.—1, W. Schofield. 2, D. Clayton, Bradford. *hc*, C. Carr. *hc*, Mrs. Kay; H. Grant. Hen.—1, C. Carr. 2, J. Thresh. *hc*, W. Schofield. *hc*, H. Grant; R. Walker. *hc*, E. Elsworth, Barrowclough Staining, Mirfield; H. Grant.

GAME BANTAMS.—*Red*.—1, J. Sugden, Cleckheaton. 2, G. Noble, Staincliffe. 3, I. Goodall, Heckmondwike. *hc*, W. Smith, Northowram, Halifax. *hc*, F. Holt, Staincliffe; E. Jennings, Staincliffe, Leeds; F. Naylor, Heckmondwike. *hc*, A. Wilmore. *Any other variety*.—1, G. Noble. 2, F. Holt. *hc*, J. Lister, Heckmondwike; F. Naylor; W. Smith.

BANTAMS.—*Black*.—1, Brown & Horsfall, Harding, Bingley. 2, W. Smith. *hc*, C. & J. Illingworth, Hightown. *hc*, H. Jagger. *White or any other variety*.—1, C. Carr.

PIGEONS.

CARRIERS.—1 and hc, Miss M. Seaton, Leeds. 2, B. Rawnaley, Gilstock, Bingley.

ANTWERPS.—1 and hc, B. Rawnaley. 2, Miss M. Seaton. *hc*, R. Parker, Heckmondwike. *hc*, A. Kinsell, Gomersal.

TUMBLERS.—1, J. Hawley, Gillingham. 2, J. H. Sykes, Huddersfield. *hc*, J. Batley, jun., Heckmondwike; B. Rawnaley.

OWLS.—1, Miss M. Seaton. 2, H. W. Stansfield. *hc*, J. Thresh. *hc*, J. Batley, jun.; B. Rawnaley; J. Hawley. *hc*, S. Sharp, Heckmondwike; A. Smith.

POUTERS.—1, J. Hawley. 2, J. H. Sykes.

DRAGONS.—1, Miss M. Seaton. 2, B. Rawnaley. *hc*, A. Smith; J. Hawley. *hc*, E. Smith, Cleckheaton (2).

TURBITS.—1, B. Rawnaley. 2, J. Hawley.

FANTAILS.—1, J. F. Loversidge, Newark. 2, J. Hawley. *hc*, B. Rawnaley; A. Smith.

TRUMPETERS.—1, J. Hawley. 2, B. Rawnaley. *hc*, J. H. Sykes.

CANARIES.

LIZARDS.—*Gold or Silver-spangled*.—1 and 2, L. Belk, Boothroyd.

SILVER.—*Yellow or Buff*.—1, H. Ellison, Batley Carr. 2, J. Horn, Armley. *hc*, L. Belk.

GOLDFINCH MULE.—*Evenly-marked Yellow or Buff*.—1 and hc, L. Belk. 2, Overend & Spedding, Ravensthorpe.

CRESTED.—1 and hc, L. Belk. *hc*, W. Whitaker, Dewsbury.

CINNAMON.—1 and hc, L. Belk. 2, Overend & Spedding. *Evenly-marked, Yellow or Buff*.—1 and 2, L. Belk.

GOLDFINCH.—1, L. Belk. 2, J. Horn.

ANY OTHER VARIETY.—1 and 2, L. Belk. *hc*, Overend & Spedding.

RABBITS.

LOP-EARED.—*Self colour*.—*Buck or Doe*.—1, J. M. Mander, Wakefield. 2, T. and E. J. Fell, Blackburn. *hc*, S. & W. Sheard. *Broken Colour*.—1, G. S. Burton, Leeds. 2, L. E. & W. Miller, Bradford.

HIMALAYAN.—*Buck or Doe*.—1, S. Ball, Bradford. 2, J. Gelder, Bradford. *hc*, G. S. Burton.

SILVER-HAIR.—*Buck or Doe*.—1, S. Ball. 2, H. R. Glew, Wakefield. *hc*, H. R. Glew; S. Ball.

ANY OTHER VARIETY.—*Buck or Doe*.—1, S. Ball. 2, G. C. Hutton. *hc*, A. Atkinson, Huddersfield.

COMMON.—*Buck or Doe*.—1, A. Atkinson. 2, H. Senior, Staincliffe. *hc*, J. C. Brook, Heckmondwike.

JUDGES.—Poultry: Mr. W. Cannan, Bradford. Pigeons: Mr. E. Hutton, Pudsey. Rabbits and Canaries: Mr. J. Beaumont, Dewsbury.

SELKIRKSHIRE POULTRY SHOW.

THE twelfth annual Show was held in the Volunteer Hall at Selkirk on the 22nd and 23rd inst. The pens used were of wood with wire fronts, the whole front composing a door, which made the birds very easy to examine, and the arrangements were very good and well carried out. The list of prizes are just a bare offer of money, with no champion cup or other inducement to the more ambitious of exhibitors, and yet the entries were very good, many English breeders trying their skill against their Scotch friends.

In Game, single cocks, a terrible old firefly of a Black Red, which it is quite dangerous to handle, secured first position; the second, a yellow-legged Pile, was a gem; the third also Black Red. In cock and hen Mr. Hanley won with a magnificent pair of Brown Reds. The second and third were Black Reds; but in the next class Mr. Nelson made compensation to himself by taking first position with a splendid pair of Brown Reds. The second and third here also Black Reds. Old *Dorkings* were a good lot, Dark Greys winning the prizes, that variety also coming to the front in chickens, with Silvers second and third. These were good classes. *Cochins* were very good; first and second Buffs, and third Whites. *Brahmas* were only good as regards the winners, the first old, and second young. The cockerel in the latter was a grandly marked bird. The prizes for chickens of the large varieties were won by Cechins and Brahmas by a Company termed the Selkirk Poultry Company, who are determined to try the production of eggs and table poultry fairly as to its remunerativeness; and let this prove as it may, there is little doubt but that if they can succeed in producing a few such pens as these as well, the balance will be on the right side of the ledger. *Hamburgs*, *Gold-pencils* a good lot, as also the *Gold-*

spangles; the Silver being poor, excepting as far as they were noticed. The first-prize pen, however, was just grand. In the Border Counties class first were Crève-Cœurs; second Gold-pencils, even better than those in the class; and third Cochins. The Selling class was large, and there were many very cheap. We never yet could bring ourselves to admire the Scotch system of showing the *Bantams* in bell-shaped pens in full sight of each other, for the restive little fellows are ill at ease and most difficult to judge—in fact, except as regards colour it is quite haphazard. In this section the entries were very good, and some of the champion birds of the season graced the pens and were well to the front. *Aylesbury Ducks* were all noticed and really good, and *Rouens* were quite perfect.

Pigeons, well placed in bell-shaped pens on tables quite under the eye, were a very pretty sight, and some capital birds competed. First on the list were Tumblers, and the winners Almond and Agates. Fantails very good, but the tails carried a little too flat on the back. Pouters were first Blue, second Black, and third White, large and stylish. Jacobins very good; Reds first and Yellows second. Nuns also good and clean; and English Owls a heavy class. First a grand pair of Silvers, evidently quite young, second Blue, and third White, by far the best except as regards the colour. In Turbitts a pair of Silver shell-crowned birds were placed first, these being perfect in all respects except that the bars are a little too kity; second very good point-headed Blues; and third Yellows. Here, as in poultry, there was a large Selling class, and many birds changed hands. The Variety class contained some good pens of standard birds, the prizes going to Dan Barbs, Black German Letz, and Blue Dragons. The Show was a success.

The following is a list of the awards:—

GAME.—Cock—1, W. Youngusband, Darlington. 2, D. Harley, Edinburgh. 3, J. Montgomery, Stretton-under-Fosse, Rugby. *he*, J. Nelson, Cockshaw, Hexham.

GAME—1, D. Harley. 2, J. A. Mather, Nithside, Closeburn. 3, J. Nelson. *Chickens*—1, J. Nelson. 2, J. A. Mather. 3, J. Brough, Carlisle. *he*, J. Montgomery. 4, G. Parker, Riddell; W. Youngusband; D. Harley. *c*, Selkirk Poultry Co.

DORKINGS—1, G. Amos, Melrose. 2, R. Reid, Haddenstree, Canonbie. 3, G. Parker, *he*, Capt. Lyon, Kirkcubbin, Dunfermline. *c*, A. Inglis, Stobo Castle, Stobo. 4, R. Reid, *Chickens*—1, R. Reid. 2 and 3, G. Parker. *he*, G. Amos. *he*, A. McKie, Heron Hill, Hawick; Capt. Lyon (2). *c*, A. Fairbairn, Whitmuir, Selkirk.

COCHIN-CHINAS—1, R. Marshall, Dumfries. 2 and 3, Capt. Lyon. *he*, W. R. Park, Melrose. *c*, A. McKie. *Chickens*—1, Selkirk Poultry Co. **BRAMA POOTRAS**—1, J. A. Dempster, Stirling. 2, R. Marshall, Dumfries. 3, Capt. Lyon. *c*, R. Reid. *Chickens*—2 and 3, Selkirk Poultry Co. *he*, P. S. Lonsdale.

SPANISH.—Chickens—*c*, J. Cairns, Galashiels. **HAMBURGERS.—Golden or Silver-pencilled**—1, R. Linton, Selkirk. 2 and *he*, R. Dickson, Selkirk. 3, W. Linton, Selkirk. *c*, J. Y. Hunter, Hawick.

HAMBURGERS.—Golden-spangled—1, R. Keenleyside, Aycliffe, Darlington. 2, G. Stalker, West Sleekbar, Bellingdon. 3, J. Kirkland, Stewarton. *he*, A. Heathie. *c*, T. May, Wolverhampton. *Silver-spangled*—1, W. R. Park. 2, E. Clayton, Thornton Banks, Kelzley. 3, G. Stalker. *he*, R. Cameron, Stewarton; J. Ballantyne, Selkirk.

ANY VARIETY.—Continued to the Border Counties—1, J. Linton. 2, R. Dickson. 3, Selkirk Poultry Co. 4, W. Linton. *he*, Selkirk Poultry Co.; T. Scott, Selkirk.

ANY OTHER VARIETY—1 and 3, W. R. Park. 2, H. A. Clark, Aspatria, Carlisle. *he*, Selkirk Poultry Co. (2); H. A. Clark. *c*, Selkirk Poultry Co.

SELLING CLASS—1, W. Coult, Selkirk. 2 and 3, Selkirk Poultry Co. *he*, W. R. Park. *he*, Capt. Lyon; J. Ashcroft, Canonbie. *c*, G. Dryden, Selkirk; Capt. Lyon. *c*, W. Scott.

GAME BANTAMS.—Black or Brown Red—1, J. Nelson. 2, J. Hine, Kendal. 3, T. Barker, Hill End, Barnley. *he*, H. Butler, Bradford. *he*, J. Hine; G. McMillan, Jedburgh; R. Hislop, Carnforth; J. Nelson.

GAME BANTAMS.—Any other variety—1 and 2, J. Nelson. 3, T. Barker. *he*, T. Beaveley, Bedlington Station; R. J. Hartley, Altrincham, Cheshire. *c*, A. Hutton, Carlisle, Earlston.

BANTAMS.—Any variety other than Game—1, R. H. Ashton, Mottram. 2, J. A. Dempster, Stirling. 3, J. Kewley. *he*, J. Fairbairn, Carlisle, Earlston; R. H. Ashton; R. Frew, Kircaldy.

BANTAMS.—Any variety.—Cock—1, W. McGregor, Stenhousemuir, Larbert. 2, J. Nelson. 3, Selkirk Poultry Co. *he*, A. Hutchison, Grahamston; J. Scott; J. Nelson. *c*, T. Barker.

DUCKS.—White Aylesbury—1, G. Dryden, Selkirk. 2 and 3, Capt. Lyon. *he*, T. Riddell. *Rouen*—1 and 3, G. E. Statler, Broomhill, Carlisle. 2, J. A. Mather. *he*, Capt. Lyon; J. Nelson.

PIGEONS.

TUMBLERS—1, W. Brydone, Longton Mains, Dunee. 2, J. Kidd, Edinburgh. 3, J. M. Brydone, Longton Mains. *he*, J. Y. Hunter, Hawick.

FANTAILS—1 and 3, J. F. Lovesidge. 2, A. Crosbie, Abbotsmoleway. **POUTERS**—1, M. Gill Skinner, Edinburgh. 2, R. W. Bryce, Edinburgh. 3, J. McDonald, Portobello.

JACOBIANS—1, W. Brydone. 2, J. Brydone. 3, R. W. Bryce. **NUNS**—2, R. Lawrie, Melrose. 3, J. Cairns. *c*, R. W. Bryce.

OWLS.—English—1, R. W. Bryce. 2, W. Ritchie, Edinburgh. 3, J. M. Brydone. *he*, J. Inglis, Selkirk (2). *c*, R. Lawrie.

ANY OTHER VARIETY—1, J. M. Brydone. 2, A. Crosbie. 3, W. Brydone. *he*, J. Brydone. *he*, R. Lawrie. *c*, R. W. Bryce. *he*, Mrs. Lang, Selkirk.

ANY OTHER VARIETY—1, J. E. Spence, Broughty Ferry. 2, A. Crosbie. 3, J. Cawley, Chester. *he*, J. Brydone. *he*, R. W. Bryce; W. Brydone; A. Hutton.

SELLING CLASS—1 and *he*, A. Crosbie. 2, J. Inglis. 3, A. Hutton. *he*, W. Brydone; J. Brydone; W. Leithhead, Tinnis; J. M. Brydone; R. Frew. *c*, J. Watson, Selkirk; McGill Sanner; J. Cowe, Aberdeen; G. Walker, Selkirk.

CANARIES.

SCOTCH FANCY.—Yellow.—Cock—1, T. Darling, Hawick. 2, J. Hardie, Galashiels. 3, G. Park, Galashiels. *Hen*—1, G. Ritchie, Selkirk. 2, W. Turnbull, Hawick. 3, P. Marshall, Selkirk.

SCOTCH FANCY.—Duff.—Cock—1, W. Mirtle, Galashiels. 2, R. Hunter, Galashiels. 3, W. Clark, Langholm. *Hen*—1, J. Heathie. 2, P. Marshall. 3, R. Hunter.

PREPARED.—Yellow.—Cock—1, J. Hardie. 2, W. Mirtle. 3, G. Park. *he*, P. Marshall. 2, W. Hyslop, Selkirk. 3, W. Turnbull. *Hen*—1, T. Darling. 2, A. Mason, Galashiels. 3, P. Marshall.

YELLOW.—Hen—1, P. Marshall. 2, W. Clark. 3, J. Hardie. **MULES**—1, G. Spiers, Selkirk. 2 and 3, T. Wilson, Hawick.

NATIVE BIRDS—1, W. Clark (Goldfinch). 2, A. Fowler, Selkirk (Bullfinch). 3, J. Heathie (Bullfinch).

The Judge was Mr. E. Hutton, Paisley, Leeds.

BROUGHTY FERRY POULTRY SHOW.

THIS Show was held in the Temperance Hall, Broughty Ferry, on the 18th and 19th inst. It was most successful, there being over five hundred entries. The poultry were well shown in the pens of the Kilmarnock Society, while the Pigeons were exhibited in the bee-hive pens generally used at Scotch shows.

Class 1, *Dorking* cocks, contained twenty entries, and were a show in themselves. The winner was good all over, and certainly the best in the class; but the second we did not like so well as the third. Class 2, *Dorking* hens (sixteen entries); an easy first and second for Mr. Gellatly, with very superior birds. Class 3, *Cochin* cocks (twenty). This was a well-filled good class. First a Partridge, which also took the cup for Cochins; second a splendid Buff, a better bird in most respects. *Cochin* hens numbered twenty-five—a goodly entry, but the winners easily picked out. The cup might have gone to the ladies in this case. *Brahmas* were numerous and good, both in the cock and hen classes. *Game* cocks made a good appearance, twenty-three of them turning out. The cup was taken by a good Brown Red. *Game* hens, though not so numerous as the cocks, were of better quality. The first-prize was a grand hen, and deserved, not only her place, but the cup. *Spanish* and *Hamburgs* had not anything very striking in their ranks, but with the next class—viz., *Game Bantams*, it was different, for in a class of very good birds Mr. Brownlie's little Pile stood out an easy winner of the *Game Bantam* cup. In the *Bantam Variety* class a pair of good Silver Sebrights were first; second good Blacks. The other classes contained nothing of importance.

PIGEONS numbered 175 entries, and amongst them there were many cracks, a good few of which went under. *Pouter* cocks, Any colour, seven entries. Mr. Bryce here won first and cup for the best *Pouter* in the Show with a Black, not nearly so good, however, as Mr. Ure's second and third, which were better birds in every way. In *Pouter* hens (twelve entries), Mr. Bryce was again successful, but, as before, Mr. Ure's third and very highly-commended beat him hollow, as far as we can see. Second a fair Yellow, but washy in colour; third a splendid Black. *Pouters* of 1874 were very good and well judged. The first and second two magnificent Blues; third a stylish Black. Several English birds were shown in this class. They did not like it. *Carriers* were not numerous, but of good quality. Mr. Smith first with a good hen deservedly. Mr. Spencer's very highly-commended we liked next, and then Mr. Smith's third. In *Tumblers* Mr. Beckwith won with a pretty little Agate; second a whole Red; third a good Kite. It is easily demonstrated that *Fantails* are at home in Broughty Ferry, as thirty-two of them put in an appearance to compete for the cup offered them. Mr. Galt won with a nice bird, not so good, however, as the three following it in the prize-list, nor yet equal to the same gentleman's other entry. Mr. Lovesidge showed four pens unsuccessfully of the English type. *Jacobins* were not a specially good class, and the same may be said of that for *Turbitts* and *Owls*, except the first-prize Foreign. *Trumpeters* were headed by Mr. Lederer's bird, which in the face of the second, and still more so the third, was wrong. *Barbs* were a grand lot, Mr. Bryce's Red having to put up with second honours to a good Yellow; third a handsome Dun; extra third Black. The Variety class contained nothing of note.

DORKINGS.—Cock—1 and Cup, Mrs. W. Chalmers, Broughty Ferry. 2, Col. M. Dougall, Tayport. 3, G. Cathill, Meigle. *he*, G. Cathill, Mrs. Armitstead, Inchture; W. L. Mason, Errol. *c*, R. Blyth, Kingskettle. *Hen*—1 and 2, D. Gellatly, Meigle. 3, G. S. Robb, Leshe. *he*, R. Blyth. *c*, Mrs. Armitstead; D. Welch, Errol.

COCHINS.—Cock—1 and Cup, Mrs. Armitstead. 2, Mrs. W. Stevan, Montrose. 3, W. M. J. Paton, Broughty Ferry. *he*, Mrs. A. G. Duncan, Broughty Ferry. *c*, W. Nicoll, Forfar; Mrs. W. Garner, Long. *Hen*—1 and 2, W. M. J. Paton. 3, Local. *c*, A. G. Duncan. 3, W. Nicoll. *he*, W. Smith, Newport; Mrs. W. Stevan; T. Bruce, Glasgow. *c*, Mrs. W. Carney; Miss Drummond, Errol.

BRAMAS.—Cock—1, J. Smart, Dundee. 2, A. Garnet, Montrose. 3, W. H. Norrie, Broughty Ferry. *he*, W. Henderson, Tayport; J. Sandeman, Dundee. *c*, F. C. Parker, Dundee. *Hen*—1 and Cup, A. Burnett. 2 and *he*, Mrs. W. Stevan. 3, Local. *c*, G. Duncan. 3, Mrs. Littlejohn, Broughty Ferry. *c*, J. C. Smith, Broughty Ferry.

GAME.—Cock—1 and Cup, T. W. Mitchell, Perth. 2, J. H. Herriot, Kircaldy. 3, W. Nicoll. *he*, J. Livesdon, Forfar; Master A. Frew. *c*, Mrs. J. Millison, Meigle. *Hen*—1 and 2, T. Tosh & Co., Forfar. 3, H. W. Hutcheson, Kircaldy. *he*, D. Stewart, Forfar; G. Salmund, Monteth. *c*, J. Patullo, Broughty Ferry.

SPANISH—1, W. M'Beath, Tillycoultry. 2, J. Norval, Alloa. 3, Mrs. W. Stevan. *he*, J. Soutar, Carnoustie. *c*, G. Sandeman, Kermuir.

HAMBURGERS.—Spangled—1, G. Low, Carnoustie. 2, G. Campbell, New Pitsligo. 3, Mrs. Brown, Crief. *c*, H. Stewart, Carnoustie. *Pencilled*—1 and Cup, G. Cathness, Carnoustie. 2, R. Thomson, Kircaldy. 3, H. Russell, *he*, J. Taylor, Montrose.

GAME BANTAMS.—Cock—1 and Cup, R. Brownlie, Kircaldy. 2, J. Patterson, Monteth. 3, J. Grievie, Aberdeen. *he*, R. Stenhouse, Crossgates. *c*, A. Walker, Monteth. *Hen*—1, J. Waddell, Airdrie. 2, Mrs E. P. Frew, Kircaldy. 3 and *c*, R. Brownlie. *he*, J. Grievie.

BANTAMS.—Variety—1 and 3, Miss R. C. Frew. 2, R. H. Ashton, Manchester. *he*, J. Symon, Errol.

ANY OTHER VARIETY—1, J. Taylor. 2, G. Cathness. 3, R. Blyth. *he* and *c*, J. Smart.

DUCKS—1, A. Dowie, Carnoustie. 2, Col. M. Dougall. 3, A. Mackie, Liff. *he*, P. Symon.

SELLING CLASS.—*Cock or Two Hens*.—1, Mrs. C. B. Taylor, Montrose. 2, A. Bowie. 3, W. Smith. *hc*, Mrs. A. G. Duncan; J. E. Spence, Broughty Ferry; A. Bowie; G. H. Nicoll.

CROSS.—1, W. Crabb, Monifieth. *Cock*.—1, Mrs. Chalmers. *Hcn*.—1, A. Walker.

PIGEONS.

POUTERS.—*Cock*.—1 and Cup, R. W. Bryce, Edinburgh. 2 and 3, G. Ure, Broughty Ferry. *hc*, A. Robb, Alloa. *hc*, G. Ure; W. S. Mallister, Lanark. 4, T. Mulholl, Perth. *Hcn*.—1, R. W. Bryce. 2, A. Robb. 3, G. Ure. *hc*, G. Ure; Major Thomson, Broughty Ferry. *hc*, T. Mulholl; Major Thomson. 4, G. Ure; Major Thomson. 5, E. Spence. 6, Young. 7 and 8, G. Ure. 9, J. C. Lyell, Monifieth. *hc*, R. W. Bryce; G. Ure. *hc*, A. Robb. *c*, J. E. Spence; E. Beckwith, Monkwearmouth; J. C. Lyell.

CARRIERS.—*Cock or Hen*.—1 and 3, A. Smith, Broughty Ferry. 2, E. Beckwith. *hc*, P. R. Spencer; J. C. Lyell. *hc*, J. E. Spence. *c*, P. R. Spencer.

TUMBLERS.—*Cock or Hen*.—1, E. Beckwith. 2, J. Smart. 3, D. Brash, Edinburgh. *hc*, J. Smart; J. Kilgour, Crossgates. *c*, A. Duncan, Crossgates.

FANTAILS.—*Cock or Hen*.—Cup and *hc*, J. Galt, Kilbrinie. 2, J. E. Spence. 3, G. Ure. Extra 3, A. Smith. *hc*, J. E. Spence. *c*, J. Smart; P. R. Spencer; E. Beckwith; W. Baillie, Monifieth.

JACOBIANS.—*Cock or Hen*.—1 and 3, R. W. Bryce. 2, J. Smart.

TRUMPETERS.—*Cock or Hen*.—1, J. Lederer, Liverpool. 2 and 3, G. Ure.

TURBITS OR OWLS.—*Cock or Hen*.—1, R. W. Bryce. 2, T. Nicol. 3, W. & R. Davidson, Montrose.

BARDS.—*Cock or Hen*.—1, 5, and *hc*, J. E. Spence. 2, R. W. Bryce. Extra 3, P. R. Spencer. *hc*, T. Nicol; E. Beckwith. *c*, R. W. Bryce; J. Cowe, Aberdeen.

VARIETY CLASS.—*Cock or Hen*.—1, J. M. Rodgers, Montrose. 2, W. McClive, Ayr. 3, T. Nicol. *hc*, R. Brownlie. *c*, J. M. Rodgers; J. Kilgour.

TUMBLERS.—1, J. G. Orr. 2, D. Paton.

CANARIES.

BUFF OR YELLOW.—*Cock*.—1, G. Crow. 2, A. Morris, Loches. *hc*, D. Kilgour; F. Batchelor. *c*, D. McDonald, Forfar; D. Wright, Dundee. *Hcn*.—1, J. Leitch, Dundee. 2, A. Morris. *hc*, J. Livingston; A. Livingston. 3, W. Boyle, Arbroath; D. Kilgour, Crossgates.

MARKED.—*Cock*.—1, W. Maally, Loches. 2, J. Leitch. *hc*, C. Ormond, Forfar. *Hcn*.—1, D. McDonald. 2, J. Muller, Dundee. *hc*, D. Kilgour (2). *c*, J. Lawson, Dundee; D. Wright.

ANY OTHER VARIETY.—1, J. Shanks, Arbroath. 2, A. Morris. *c*, J. McIntyre; C. Ormond.

JUDGES.—*Poultry*: Mr. Paterson, Airdrie. *Pigeons*: Capt. Hill, London.

LIVERPOOL CANARY SHOW.

THE fifth annual Show of Cage Birds was held at Liverpool on Friday and Saturday, December 11th and 12th. There were 128 birds shown for competition, the greater portion of which were Belgian-bred birds, exhibited in the first four classes, a silver cup having been offered by Mr. Rogers, the Secretary, to the winner of the most points in the Belgian classes. The awards are as follow:—

BELGIANS.—*Clear Yellow*.—1, E. Simpson, Wally, Wigan. 2, A. Duxbury, Over Darwen. 3 and 4, T. M. Reid, Halifax. *hc*, J. Martlew, Ormskirk; A. Duxbury. *hc*, J. Hughes. *Clear Buff*.—1, A. Duxbury. 2, E. Simpson. 3, J. Hughes. *hc*, T. M. Reid; E. Simpson. *hc*, J. Foster. *c*, A. Macferson; J. Martlew.

BELGIANS.—*Ticked or Variegated Yellow*.—1, E. Simpson. 2, A. Duxbury. 3, J. Hughes. *hc* and *c*, J. Martlew. *hc*, W. H. Jacobs. *Ticked or Variegated Buff*.—1 and 2, J. Hughes. 3, Mrs. Rogers. *hc*, J. Coward. *hc*, J. Martlew. *c*, A. Duxbury.

LIZARDS.—*Goldenspangled*.—1, T. M. Reid. 2, Cleminson & Ellerton, Darlington. 3, J. Grace, Everton. *hc*.—Hardy, Eccleston, St. Helen's. *hc*, W. Lawton, Liverpool. *c*, J. H. Rogers. *Silverspangled*.—1, J. McGregor. 2, T. M. Reid. 3, J. H. Rogers. *hc*, J. Grace. *hc*, W. Roston. *c*, W. Lawton.

NOAHWIG.—*Clear Yellow*.—1, J. H. Rogers. 2, J. McGregor. 3, J. Hooley. *hc*, A. Macferson. *hc*, W. Peers. *c*, R. Murray. *Clear Buff*.—1, R. Murray. 2, J. Grace. 3, A. Macferson. *hc*, F. Walker. *c*, W. Storms.

NORWICH.—*High Colour Yellow*.—1, A. Duxbury. 2 and 3, J. H. Rogers. *High Colour Buff*.—1, A. Duxbury. 2 and 3, J. H. Rogers. *c*, T. M. Reid.

SINGING CANARIES.—1, W. Lawton, Bronte Street, Liverpool. 2, J. H. Rogers.

3, J. Latham, Wigan.

GOLDFINCHES.—1, W. Roston. 2, C. Gibson. 3, T. Short.

JUDGE.—Mr. Orrell, Bolton.

THE DRAGOON.

MUCH as I admire "WILTSHIRE RECTOR's" ably written article in last week's Journal on my pet the Dragoon, I, as a thorough Dragoon fancier, beg to differ from him on one or two very essential points. "WILTSHIRE RECTOR" says a Dragoon "should not be a large bird; the beak should not be short and thick; the eye-wattle should not be a little pinched at the back, but as circular as possible." Now, not only I but every Dragoon fancier of my acquaintance considers size a great desideratum, and in selecting breeding stock choose birds (especially hens) possessing size. I have carefully noted the awards at recent exhibitions, and always found birds of good size to the front. It should not be so large as a Carrier, but above the size of an ordinary Pigeon. Next comes the beak. I believe we are all agreed that the length should not exceed 1½ inch from centre of eye, but by all means we must have a stout beak. I would not have the spindle-beaked birds one occasionally sees at a local exhibition. As a specimen of the stout beak I so much admire, I refer those of your readers who visited the recent Birmingham Show to the cup pen of Blues. Why "WILTSHIRE RECTOR" holds out that the eye-wattle should not be a little pinched at the back I am at a loss to understand, since not only nearly every pure Dragoon shows this point, but it is also an essential difference from the eye-wattle of a Carrier. I quite agree with you correspondent that the Dragoon should be a smart-looking, a finely-formed bird, and as unlike a Carrier in every respect as possible, but cannot give way that it should be slightly built, or we shall soon see this beautiful bird deteriorate into little better than a common Skionum.

Having pointed out where I disagree with "WILTSHIRE

RECTOR," I will give my idea of a Dragoon and the standard I breed to. In the first place, a Dragoon (as I have just observed) should possess size; good carriage is another essential point. The eye-wattle small, neat, and slightly pinched at the back, with a tinge of black inside nearest the pupil of the eye, which greatly increases the bold wild appearance of the bird. Colour of eye bright deep orange or red. The beak stout, black, and measuring 1½ inch from centre of eye, slightly curved at the end. Beak-wattle peg-shaped, even on both sides; there must be no jaw wattle. Shoulders broad and standing well out from the breast. Blues should be of an even and sound slaty-blue colour throughout—i.e., back, rump, and thighs, with black and narrow bars well defined. Silvers, brown bars.

I am glad to see committees are providing classes for young birds; the awards will therefore appear (to the uninitiated) more satisfactory, since only birds that have reached maturity will appear in the classes for old birds.—R. W. C. P.

RUSSIAN TRUMPETERS.

I HAVE just read your report of the Belfast Poultry Show, and venture to take up my pen in defence of the Russian Trumpeters. It seems to me that most of the Pigeon critics, including "WILTSHIRE RECTOR," have a grudge against them; and foot-feathering being apparently their weak point, always abuse them for that defect. Now, if these gentlemen would take the trouble to examine the birds they would find that in fully half the birds exhibited the feathers are broken and not half their real length. Unless taken the greatest care of, it is almost impossible to prevent this on account of the fragile nature of the feathering. The first-prize Mottle at Belfast had in the show pen feathers on his feet 5½ inches long; the third-prize Black 4½ inches. I have now in my loft an imported hen with feathers 5½, and one bred from imported birds 5 inches, so that I think I may assert that they are not so deficient in feet feathers as is stated. They are also usually spoken of as the new type of Trumpeters; I believe them to be simply a very pure and highly bred strain, and that our so-called English Trumpeters are only a cross and degenerate stock, perhaps bred from some previous importation before Pigeon shows were thought of.

Would twenty years of careful breeding and selection from the best English strain ever manufacture a bird equal to those imported? I think not.

That extravagant foot-feathering is not an evidence of purity of blood I am quite certain, as I bred a bird this year with stiff feathers on his feet fully 6 inches long, and a good voice, one of whose grandparents was a German Shielded Trumpeter with bare feet and no voice; in fact, you could not distinguish him from his father, a common White Trumpeter, except by his colour, a slaty Red.—TRUMPETER.

RABBIT-KEEPING.—No. 3.

FEEDING.

FIRST, as to the time of feeding. I find that twice a day is sufficient. The first feed is given about six o'clock a.m. in summer, and about half-past seven in winter. This should consist of wheat, buckwheat, or barley, with the addition of a small piece of turnip or carrot about the size of a hen's egg. In summer I give a small handful of clover instead of the roots. In feeding the above grains I alternate them; this gives the Rabbits a better relish for their food.

The night feed, which is given about six o'clock, is always oats, with a handful of cut hay (clover, if to be had), and when green food is scarce a small piece of turnip or carrot. If fresh clover can be obtained it is better to dispense with both hay and roots. In using green food never give it while wet. Cut it and let it wilt before using. Cut it when dry, and keep one day's supply ahead. Dry food, with privation of greens, water to drink, and cold temperature, sometimes occasions obstinate constipation. The warmer Rabbits are kept the better they thrive. When vegetables are gathered fresh they should not be given wet—unless very seldom, and when hay is given, which will drink up the moisture, and keep them sound without danger. Occasionally give for morning feed whole Indian corn. Peas soaked a few hours and then drained make another good change for the morning feed. In their season beet and carrot tops and pea haulm are a safe and good feed when not used in excess, and should not be given very often. The too free use of very green or wet vegetable food will be certain to produce the most disastrous results. Pot-belly, dropsy, and other diseases are sure to follow. Dandelion tops are greedily devoured, and are a most excellent feed. This is an almost certain cure of the disease known as red-water, and is an excellent corrective of other ills. Plantain leaves and sow thistle are also a safe and good feed if not used in excess.

A very little salt once a week mixed with their feed is beneficial. For condiments to tempt the appetite use fennel, sweet marjoram, parsley, and tea leaves dried; but these should be used in small quantities, and more as a tonic than a regular

diet. All grain or food that is left in the feed cups should be removed before putting in a fresh supply.

After having breathed on the feed and mussed it over, the Rabbit, who is a dainty animal, will not eat it, unless compelled by hunger. The feed-cups should be washed often, for cleanliness is one of the indispensable adjuncts to success. The same cup should not be used for both wet and dry feed unless thoroughly cleansed and dried after being used for the former.

Does with young should be more liberally fed, and with more nourishing diet than others. A slice of bread dipped in milk is a dainty treat for them, as well as being very nutritious. Also, young Rabbits after being weaned should be well tended to; kept clean and warm with plenty of food, and success is quite certain.

The key to success in Rabbit-keeping is:—

- 1, Dry food mainly.
- 2, Frequent change of diet.
- 3, Regularity in feeding.
- 4, Cleanliness.
- 5, Warmth in the winter season.
- 6, Large and well-drained hutches.

—P. J. KELLER.—(*American Fanciers' Journal*)

EFFECTS OF COLD AND DAMP ON BEES.

UPON a due appreciation of this subject much of the success of bee-keepers depends. If we consider bees as we should human beings, we should not err much in the treatment and construction of their domiciles. With proper ventilation, Langstroth, the great American apiarist, says, "No amount of cold that we ever have will injure bees;" and as he records the temperature of January, 1857, at 30° below zero, which is never reached in England, I do not think we need fear. Much has been said and written about the superiority of this or that hive-covering, whether it shall be wood, straw, carpet-rush-matting, or what not, but least of all is said about no covering at all more than shelter from the rain, and yet it is quite possible that this may be the most successful way after all. We all know a cold dry winter is more healthy than a mild wet one, even though the temperature of the latter should be many degrees higher, and a large airy bedroom with window open is preferable to a small close one with sand-bags and appliances to keep the cold out. If building a cow-house, stable, or fowl-house, should we reduce the cubical space by putting up a ceiling? No; on the contrary, we should appreciate the better ventilation that the uncovered rafters would give, even at the expense of a lower temperature. Langstroth cites a case where twenty hives were in a row, one suspended 20 inches from the ground, without a bottom board; the others in the usual condition for wintering. The whole got very wet; the nineteen died, and the one survived. In discussing this subject lately with one of our most successful apiarists, he mentioned that a hive which gave him a super of 76 lbs. weight this year was wintered without a crown board, but covered with an empty super, and, as the result showed, with advantage to the bees. Many bee-keepers have, at the recommendation of a well-known bee-master, this winter thrown away their crown boards and substituted a square of carpet, supplemented by what one disgusted bee-keeper styles "pile of marine stores to complete the quilt;" the result proves what was long ago discovered in America—the whole, from internal and external moisture, becomes a rotten mouldy mass, neither good for man nor bees, and the followers of this new fashion are fast discovering this. True it is that bought experience is most appreciated, but it is a pity that payment should be made by the lives of the poor bees.—JOHN HUNTER, *Eaton Rise, Ealing*.

DEPRESSION OF HIVE FRAMES.

IN reply to your correspondent "PEECHONE," who seems to question the possibility of a depression of a long frame from the weight of bees and their combs, I can only say that I have not a few instances in which the sinking is at least double of that upon which I based my calculations. Had the weather allowed an examination I would have given "PEECHONE" the exact measurements. By re-reading my letter he will find that I made no prediction, but gave simply the data and results of a calculation, which in itself would have been hardly suited to your columns, since it involves a knowledge of trigonometry and natural philosophy; but should "PEECHONE" desire it he can have it of me privately. The hives in which these depressions have occurred take Quinby frames, and were purchased of Mr. Abbott, but have top bars thinner and less stable than those of his last pattern. From experiments made I think the difficulty I have indicated as extremely likely, but the fact that combs are occasionally built to the floorboard, as "PEECHONE" admits, is in itself an all-sufficient reason for retaining the bottom rail unless some considerable advantage is to be gained by abandoning it. The idea that the comb from its formation would tend to support the top bar, as "PEECHONE" asserts, is utterly erroneous, since

the comb is generally commenced in the centre, and continues by its growing weight to increase the sagging as the work progresses.

"PEECHONE" asks me how the bottom rail assists ventilation. The cluster in winter, if a bottom rail be used, does not extend down to the floorboard, so the entering air passing under the whole mass percolates through it, as it warms and attains ascensive power. In full skeps and in the hives in question the bees commonly touch the floorboard, and so would obtain new supplies of air on the side of the cluster only. It would take far more time and space than are at my disposal to prove the disadvantage of this; but as I have already said, "experience has shown that good ventilation beneath the combs greatly aids in wintering," and all who are acquainted with American bee literature will bear testimony to the corroboration which this statement has received.

"PEECHONE" puts a construction on the latter part of my letter which it cannot be made to bear, and then informs me I am in error; but even had I stated what he seems to have supposed the error is his, for he is evidently not aware that my hive to which was awarded first prize, a most complete bar-frame hive, at Crystal Palace Show, had at the time the Show occurred been made twelve months, and that a swarm of bees had built in it during the summer. They and their combs were displaced in order that their house might be exhibited.

"PEECHONE's" concluding sentence fairly puzzles me. He says, "Strange to say his has the bottom rail." It appears to me that it would be passing strange if it had not.—F. CHESHIRE.

THE HONEY EXTRACTOR OR SLINGER.

I HAVE never bought, sold, owned, or used a slinger, but in the hands of acquaintances I have seen the combs of a large frame hive taken out, emptied, and replaced, without fuss or mess, in a very few minutes; and at intervals during the three-days Show at the Crystal Palace the operation was performed with satisfaction before the gaze of thousands; indeed it was witnessed at the Palace by the gentleman to whom the instrument used by Mr. Pettigrew belongs, who bought it then and there for home use. I presume he would not have done this unless he had been more satisfied than Mr. Pettigrew. I give the latter gentleman credit for good faith in testing fairly, as far as the materials at his command and the time of year would allow, but these very conditions made the trial essentially a most unfair one. No maker or inventor of extractors, so far as I know, has ever claimed for this machine that it could work successfully on old honey that had been allowed to get set, or with satisfaction on the loose combs cut from straw skeps. It is essentially an adjunct to frame hives, and with honey in the gluey condition of that re-liquified by Mr. Pettigrew I am not surprised at failure. With regard to the extracted honey being full of small pieces of comb, this was evidently from want of dexterity in manipulation, and would be avoided with more practice. Moreover, it should be remembered that there are three or more patterns of extractors in the field; and that used by Mr. Pettigrew, although I agree with him in saying is a good one, is not every one, nor the one which gained the prize at the Show.

The idea and principle of the honey extractor I look upon as valuable, but the machine as at present made is a bulky, clumsy affair, putting one in mind of a garden engine. I hope to find the old maxim, "out of small things springeth great" reversed, and some day to see a small thing from the great; and indeed, I hear it whispered, of an extractor in hand equally efficient that may be stood upon the table, occupying little more than a foot of surface. When we get something like that, I have no doubt it will be in general use where frame hives are in vogue. Where is Mr. Pettigrew's authority for saying "The patrons of the slinger tell us that swarms spend their first year in filling the bar frames with comb?" I neither think the inexperienced or the experienced bee-keeper would think this either reasonable or inviting.—JOHN HUNTER, *Eaton Rise, Ealing*.

TRAINING SQUIRRELS.

THE squirrels must be young, or else all attempts to train them will be fruitless. Judging from your description of their tameness that they are young, as old squirrels, and old ground squirrels especially, seldom become tractable, we will proceed to give directions for teaching them a few simple tricks:—

First, accustom them to your whistle, and teach them to come immediately to you whenever you call or whistle for them. This can be done by reducing the quantity of their food, not so as to starve them, but only so as to sharpen their appetites. After they have been dieted for a few days you will notice how much spryer and brighter they have grown. Hold a nut kernel or a grain of corn in your hand, and give a sharp distinct whistle, at the same time showing them the food. With a leap they will come to get the food; give it to the one who first reaches you. Repeat this lesson until they become familiar with the meaning

of the whistle. Generally reward the quickest with a grain of corn or a chestnut. We will now suppose that you have the squirrels perfectly subjected to your will; that they will come when you whistle, and obey your commands with dispatch. The remaining parts of their education should be taught to each separately. Place one upon a table, and gently force him into a reclining position. If he attempts to rise again gently force him back into his former state, crying "Down!" as you do so. He will soon learn the meaning of "Down!" and on the utterance of the word will instantly sink upon his belly. By a similar method he should be taught to sit erect upon his haunches.

The rope trick is quite amusing when well done. To teach a squirrel this, fasten a rope to a ceiling so that the end of the rope will reach the floor. String a few chestnuts, show them to the squirrel, and then tie them to the rope (near the top). Now place bushy at the foot of the rope; in a trice he will be up after the chestnuts. Repeat the lesson, saying "Mount!" as you place him at the foot of the rope. He will soon associate the command, "Mount!" with the rope-climbing, and on seeing the rope and hearing the word will rapidly ascend. Reward him with a chestnut whenever he performs the feat to suit you.

Another pleasing trick is jumping from a table to your shoulder. Place the squirrel on a table, and cry, "Down." Put a nut on your shoulder, and give the signal for him to come to you. If he jumps on the floor and attempts to reach the nut by crawling up on your leg replace him, and cry "Down!" Make a bridge from the table to your shoulder with your arm, and whistle for him to come to you. This time he will ascend to your shoulder by the way of your arm. Repeat the lesson, and increase the distance from the table, till he will jump to your shoulders from a table even if the distance is so far as across a small room.

Now, he must be taught to jump upon the table. This can be done in the same manner as he was taught on hearing a peculiar whistle to come to you. Without further hints you ought to be able to devise any number of amusing tricks to teach your squirrels. Bear in mind two rules—Never overfeed your pets, or allow them to be handled by strangers.—(*American Fanciers' Journal*.)

PRODUCTIVE BANTAM.—I wrote to you in August, stating the fact of a Game Duckwing Bantam hen having laid at that time 135 eggs. I now write to inform you that she has laid in the space of twelve months two hundred eggs.—J. STOKES, *Ipswich*.

OUR LETTER BOX.

GREAT YARMOUTH SHOW.—Mr. P. Haines, Dies, informs us that he was awarded the second prize in the class for Light Brahma hens.

CANTERBURY SHOW.—Mr. W. Jacobs, Shepherdswell, informs us, that though not inserted in the official prize list, that his Aylesbury Ducks were awarded the five-guinea cup.

TREDEGAR SHOW.—The second prize for Turkeys we see is stated to have been awarded to Miss J. Milward, but it was omitted by our reporter.

DARK BRAHMAS AT CARMARTHEN.—We are informed that the first prize was taken by H. Feast, Swansea, second by J. H. Watkins, Hereford, with adults; D. E. Williams's Chester third-prize pen, and F. L. Green's, Osklands, Carmarthen, highly commended, being this year's birds. The medal in Class 22 was awarded to a Dark Brahma cockerel belonging to A. T. Waters, The Phoenix, Kidwelly.

HIVES (T. B.).—Remarks on the merits and drawings of hives, whether of wood or straw, we shall readily insert. We only closed the controversy because every letter we received was either disguised by personalities, or written as if the writer thought no one had a right to differ from him in opinion.

CANARIES AND HOW THEY ARE KEPT.—"M. G." need not be surprised if his Canaries occasionally cast some of their feathers through being kept in a room with a fire during the daytime, and enduring the cold at night 2° below freezing-point as stated. The covering over the cages at night would not be of much advantage unless the room is draughty. It will not make up for the difference between the artificial heat during the day and the thermometer at about 32° or more during the night. Of two evils, the fire would be more essential at night; but to suddenly abolish it would be detrimental to the birds. The continual changes will certainly tend to weaken the constitution of the birds, and bring about asthma and premature deaths. Canaries will endure much cold weather, and enjoy tolerable good health beneath a roof free from draughts of cold air. Our own birds fly in a large room, the topmost one of the house, are hardy, robust, and in good feather, and sport in a cold bath as free as Ducks, even during the present inclement season. We can back-up our experience with that of others; one fancier in particular we will refer to, who, for upwards of a dozen years, has kept his birds in a detached brick building during summer and winter, the only drawback during frosty weather being that he has had occasionally to break the ice for the birds to obtain water, or the ice itself has cracked the fountains. His birds always enjoy good health. This is a pretty fair test as to the amount of cold weather Canaries will stand. The birds above referred to are of the Norwich and Lizard breeds. If "M. G." could keep up an even temperature during day and night his Canaries would not be liable to so much risk. Birds rarely do so well, or continue breeding so long during the summer, if they have been kept in an artificial heat during winter and spring.

SEED FOR CANARIES, BULLFINCHES, LINNETS, &c. (W. F., Belfast).—We have examined the three kinds of wild seeds forwarded. One of the three

sorts is understood amongst bird-fanciers in many parts of England as "redlock," a kind of wild rape found in corn fields. During the winter months especially many fanciers make a practice of occasionally throwing a handful or so into the cages for the birds to eat, which plan is considered better than supplying it either in a fountain or seed-hopper, owing to the amount of rubbish mixed with it. It is a somewhat stimulating kind of seed, and is suitable either for Canaries, Goldfinches, Bullfinches, Siskins, or Linnets. One of your samples resembles the above-named "redlock" more than anything we know of. As to the bright, black, flat, heart-shaped seed (the second kind), we have before seen it mixed among the "redlock" seed when given to the birds, and this fact leads us to think that it is not of an injurious tendency. With respect to the smaller or third kind forwarded, which is of a brown colour, triangular-shaped, and sharply pointed at each end, we must confess we are somewhat doubtful whether it would be wisdom to give it to Canaries. Possibly some of the Finch tribe may partake of it in their wild and natural state; still, like yourself, we are anxious to know whether the seed would be suitable. The experiment is worth a trial; and if you do not try it yourself, be at the expense of forwarding a quart of the three kinds to our office, and we will cause them to be tested and let you know the result. Canary seed at the present time is enormously high in price, and if other food can be found fit for cage birds so much the better for fanciers, who now-a-days have to put their hands deeper down into their pockets for eggs and cayenne pepper.

REMARKS.

23rd.—Fine frosty morning—very sharp; fair all day; foggy in evening; and rain at midnight.

24th.—Overcast, a little sleet early; dull all day, and slight thaw.

25th.—Fair all day; colder in evening.

26th.—Fine frosty morning; foggy about 2 P.M.; rather warmer at night.

27th.—Fine frosty day.

28th.—Very dark morning; sleet, and afterwards slight snow, throughout the day.

29th.—Sharp frost, and although the sun was bright and warm (42.8°) the roads remained hard and the ground covered with snow. Very cold in the evening.

A fine sharp winter's week.—G. J. SYMONS.

COVENT GARDEN MARKET.—DECEMBER 30.

The market has been well supplied with both fruit and vegetables this Christmas, prices being generally lower than usual. Grapes and Pines are plentiful for the time of year, but the supply of dessert Peas is nearly over.
